sions in North America, with extraordinary powers, in order to effect the adjustment of the disputes there. April 23, the Sirius (which left April 4) and Great Western (April 8) steam-ships arrived at New York from England, being the first vessels which crossed the Atlantic by steam power alone. May 31, a lunatic named Thom, who assumed the name of Sir William Courtenay, and proclaimed himself king of Jerusalem, having excited a number of deluded followers against the Poor-Law Act, a contest ensued with the military, and Thom having shot two men was himself shot by one of the soldiers. June 28, the coronation of Queen Victoria took place, which was attended by Marshal Soult, the old opponent of the Duke of Wellington, as ambassador from the King of the French. July 31, the new Irish Poor Law and the International Copyright Acts were passed. On August 10 and 15, the Belgo-Dutch treaties and the Irish Tithe Compositions Acts were passed. August 16, the Queen prorogued parliament. On September 17, the London and Birmingham Railway was opened throughout its entire length. October 9, the Earl of Durham declared his intention of resigning the governorship of Canada, in consequence of some of his proceedings being disapproved. November 1, the rebels were defeated at Napierville. On November 4, there were riots at Montreal. In November intelligence was received that Dost Mohammed Khan, the chief of Cabul, had joined Persia with an intention of attacking the British possessions in India, whereupon the governor-general had adopted the cause of Shah Soojah in his claims on the throne of Afghanistan. November 17, the rebels in Canada were again defeated near Prescott in Upper Canada, and the insurrection finally suppressed. December 2, a proclamation was issued against illegal Chartist assemblies, several of which had been held at night in various parts of the country, those attending them being armed with guns, pikes, &c.

1839. January 7, the Académie des Sciences at Paris made a report on the invention of M. Daguerre, the originator of the daguerreotype process, which has been followed by the photographic process. January 20, the troops of the East India Company occupy Aden. February 5, parliament opened by the Queen. April 7, the Chinese government arrested Captain Elliot, the superintendent of the British trade in China and compelled him to deliver up opium to the value of 3,000,000*l*. May 6, the government having been defeated in the House of Commons on a bill for suspending the constitution of Jamaica, where the House of Assembly had refused to pass the princes' bill, Lord Melbourne announced to the House of Lords that on the 7th, that the ministry had resigned. On the 8th, Sir Robert Peel received her majesty's command to form an administration; but owing to the refusal of the Queen to dismiss the ladies of her household, he declined the commission, and on the 10th Lord Melbourne was reinstated. June 8, ratification of the treaty for the separation of Holland from Belgium. June 14, the Designs Copyright Act passed. July 15, Chartist riot at Birmingham suppressed by the military, but not till a large amount of damage had been done. July 20, the British army in India attacked and captured Ghizne; Dost Mohammed fled, and Shah Soojah was proclaimed sovereign of Cabul. August 17, the Postage Act passed, enacting a uniform rate throughout the kingdom for all letters not exceeding half an ounce in weight, and it gave the Treasury the power of fixing the rate at first, though it was to be ultimately one penny. This was done by reducing all rates above 4*d.* to that sum, leaving all below 4*d.* unaltered. It came into operation on December 5; and on January 10, 1840 the uniform half-ounce rate was reduced to one penny. The Act was for one year only, but it was continued in 1840. October 10, Prince Albert of Saxe-Coburg arrived in London. November 4, Newport in Monmouthshire was attacked by a party of Chartists, estimated to number about 10,000 men, under the command of John Frost, an ex-magistrate. They were opposed by the mayor, Mr. Phillips, and a party of special constables, assisted by about thirty soldiers. The rioters broke the windows of houses, fired on the inmates, and the mayor was wounded; upon which the soldiers fired, made a sortie, and dispersed the mob, of whom about twenty were left dead on the spot. The next day Frost and some others of the leaders were apprehended; on December 31, they were tried, found guilty of high treason, and sentenced to death, but the punishment was commuted to transportation for life. November 23, the Queen announced to the Privy Council her intended marriage with Prince Albert. November 24, the trade between England and China was stopped by order of Lin, the Chinese Imperial commissioner.

1840. January 11, a Chartist outbreak contemplated at Sheffield was discovered and prevented, some of the leaders being apprehended. Slight disturbances took place about this time also, in a few other towns of the North. January 16, parliament opened by the Queen, and Lord John Russell brought before the House of Commons the case of Stockdale, who had brought an action against Hansard, the printer to the House, for a libel contained in some of the papers printed by order. He had obtained a verdict, issued execution, and the sheriffs of Middlesex had seized and sold some of Hansard's property. The House declared all these proceedings breaches of privilege. At different times, and after considerable discussion, Stockdale, his attorney, the two sheriffs, and some subordinate agents, were committed to the custody of the sergeant-at-arms. A bill was subsequently brought in by Lord John Russell, for exempting from such actions all papers ordered by the House to be printed, which was passed on April 14. February 10, the marriage of the Queen took place, attended with festivities throughout the country. March 16, the English ambassador at Naples presented a note, complaining of the establishment of a monopoly of the trade in sulphur granted to a French company in contravention of the treaties with England. As the Neapolitan government refused satisfaction, an English fleet was ordered to Naples to adopt coercive means; but by the mediation of France hostilities were prevented, and the sulphur trade restored to its former course. May 6, the new stamps and envelopes for pre-paid letters came into use. June 4, the Act for the better effecting Tithe Composition in England and Wales received the royal assent. June 10, a pot-boy, named Oxford, fired two pistols at the Queen while riding up Constitution Hill in her open carriage; he was seized, tried, and sent to Bethlehem Hospital as a lunatic. July 3, the fort of Amoy, in China, was destroyed by the English fleet, and on the 10th, the island of Chusan was taken. July 23, the Act for uniting the provinces of Upper and Lower Canada received the royal assent. August 7, the Act against employing children to sweep chimneys, and on August 10, that for regulating Irish Municipal Corporations, received the royal assent. August 11, the parliament was prorogued. August 25, the Carlist insurrection in Spain having been suppressed, the English auxiliaries evacuate San Sebastian and Passages. October 13, Dost Mohammed Khan was defeated and wounded, and again defeated on November 2, whereupon he surrenders himself to Sir William M'Naghten, the British agent at the court of Shah Soojah. December 2, Mehemet Ali of Egypt, who had been for some time contesting the throne of the Sultan of Turkey to the sovereignty over Egypt, who had invaded and taken possession of Syria, at length, subdued by Turkey assisted by England and France, accepted on this day the terms proposed. Commodore Napier with an English fleet had greatly distinguished himself by his successful attacks on Beyrout and Acre. December 15, the remains of Napoleon Bonaparte, which England had allowed to be removed from St. Helena, were this day deposited with great ceremony in the Hôtel des Invalides, having been brought to France by a French squadron under Prince de Joinville.

1841. January 9, a meeting of the Repeal Association was held in Dublin, to receive the accounts of the preceding year; and during the spring several monster Repeal meetings were held to hear the address of Daniel O'Connell, some of which were attended by as many as 150,000 persons. January 9, the Chinese forts at Canton were attacked and taken by the British forces. January 20, after some further hostilities, the Chinese government proposed terms, by which Hong-Kong was ceded to Great Britain, direct official communication between the two powers granted, various additional ports opened to trade, and an indemnity of six million of dollars paid. January 26, parliament commenced its sittings. Feb. 10, the union of the Canadas proclaimed at Montreal, and Lord Sydenham took the oaths of office. Feb. 13, a dinner given to Lord John Russell in London, to celebrate the foundation of the most recent colony of Great Britain—New Zealand. On March 15, at a meeting of the Vice-Chancellor, heads of houses, and proctors of the University of Oxford, a resolution was passed condemning the Puseyite Tracts, which had lately excited much attention. March 23, Father Mathew continues his efforts in Ireland in favour of temperance. On this and two succeeding days, he was said to have administered the pledge to 120,000 persons. March 31, the annual meeting of the Metropolitan Anti-Corn-Law Association was held, numerous meetings with a similar object having been held in various parts of the country. April 23, a meeting called by the Archbishop of Canterbury, in London, to raise funds for sending out bishops to the colonies, when a large subscription was obtained. On the same day, the preliminary expedition of the second settlement in New Zealand sailed under the command of Colonel Wakefield; the colony to be formed on the principle propounded by E. G. Wakefield, limiting the area, and applying the land produce fund to the purpose of obtaining labour. May 18, a great meeting held at Manchester, to petition for a total repeal of the Corn-Laws. Many other meetings for the same purpose were held throughout the country, some of which were disturbed by the attempts of Chartists to incorporate a petition for universal suffrage. May 28, hostilities recommenced at Canton. The British forces, under Sir Hugh Gough, took two forts, and the town capitulated, having agreed to the previous terms and to pay six millions of dollars within one week. May 27, the case of the seven ministers of the presbytery of Strathbogie was brought before the assembly of the Scottish Church; when they were suspended for having obeyed the order of the civil courts in placing the minister of Marnoch against the order of the Assembly. A large minority protested, and a numerous meeting was held in Edinburgh on the following Monday (31st), to express their sympathy with the deprived ministers. On the 27th Sir Robert Peel brought forward a resolution in the House of Commons, declaring that the ministry did not possess the confidence of the country. June 4, the debate terminated, and the resolution was carried by 312 against 311. On the 7th, Lord John Russell informed the House, that in consequence they should appeal to the country. On the 22nd the parliament was prorogued and dissolved. June 21, the Act for the Commutation of Copyhold and Customary Tenures, and that for affording Facilities for the Conveyance and Endowments of Sites for Schools received the

Digitized by Google

royal assent. August 19, the new parliament met. An amendment to the address was moved by Sir R. Peel; and after a debate, the amendment was carried. On the 30th, the ministers announced their resignation, and Sir R. Peel was commissioned to form a new ministry. In September, accounts arrived from various parts of the country, representing the extremo distress of the manufacturing districts of the country. October 4, a great fire occurred in the Tower, which destroyed the storehouse and the small-arms armoury. November 25, Akhbar Khan, the son of Dost Mohammed, joins the insurgents of Cabul in a series of attacks on the English. December 31, Lord Ashburton was appointed to a special mission to the United States, in order to settle the various differences between the two countries, which he concluded in September 1842.

1842. January 6, the British forces began to evacuate Cabul under a convention concluded between Akhbar Khan and Major Pottinger, but were attacked in the Cabul Pass and nearly all massacred. January 17, the first stone of the new Royal Exchange was laid by Prince Albert. February 8, about 600 deputies of the Anti-Corn-Law Association assemble in London, to promote its objects. March 6, Colonel Palmer evacuates Ghiznee, after capitulating with Akhbar Khan. On April 5, General Pollock joins Sir R. Sale at Jellalabad, after forcing the Khyber Pass. April 29, a new law for a graduated scale on the importation of foreign corn received the royal assent. May 4, the Boers of Port Natal having thrown off their allegiance to the British government, are attacked by Captain Smith with a small force, whom they defeat, but were beaten in a second action on June 26, and forced to submit. May 30, Lord Francis Ilrce is made Baron Queen, who escaped uninjured; Francis was tried for the attempt at the Old Bailey, found guilty, and sentenced to be hung, but the punishment was commuted to transportation for life. June 4, there were riots at Cork and Ennis, occasioned by want of food arising from the potato rot in 1841; and great distress and discontent continued to exist among the manufacturing population of England. June 16, the treaty with the Chinese not having been ratified, the British forces entered the river Yang-tze Kiang, and seized several forts with numerous cannon; and on the 19th they took possession of Shanghai. June 22, Sir Robert Peel's bill enforcing an Income Tax received the royal assent. July 3, J. W. Bean presented a pistol at the Queen, hut was prevented from firing by a bystander, and was afterwards sentenced to eighteen months' imprisonment; on July 10 a law was passed legalising the punishment of whipping and imprisonment for such offences. July 9, a deputation from the Anti-Corn-Law Association waited on Sir R. Peel, to represent the extreme distress of the labouring poor. July 30, a law received the royal assent, bestowing a representative government on New South Wales. August 3, a meeting took place at Manchester, owing to the distress, and the riots extended subsequently to other towns in the North. August 12, the Bankruptcy Amendment Act received the royal assent. August 29, the Queen and Prince Albert visit Scotland. September 5, Ghiznee was retaken by General Nott. On the 16th, General Pollock forces the passes, and occupies Cabul, after several actions. October 1, Lord Ellenborough issued a proclamation, stating that the disasters in Afghanistan having been avenged, the British army would be withdrawn across the Sutlej, which was done on the 12th. September 30, a special commission was held to try the offenders in the late riots, when fifty-four were convicted, and sentenced to various periods of imprisonment.

1843. January 9, O'Connell announced at a weekly meeting of the Repeal Association that "1843 is and shall be the great Repeal Year." January 20, Mr. Edward Drummond, the private secretary of Sir Robert Peel, was shot at Charing-Cross by a man named M'Naghten, who was acquitted on March 4, on the ground of insanity, and removed to Bethlehem Hospital. On February 3, parliament assembled. February 17, the forces of the Ameers of Scinde were defeated by Sir C. Napier, who, on the 20th, took Hyderabad, and subsequently annexed Scinde to the British empire. About the end of this month, the Rebecca Riots took place in Wales, the object of which was the removal of oppressive turnpike tolls. The riots continued through several months. March 25, the Thames Tunnel was opened. May 18, the secession of the supporters of the non-intrusion principle took place from the General Assembly of Scotland, when above four hundred ministers resigned their parishes. May 30, Natal was annexed to the colony of the Cape of Good Hope. July 3, the Cartoons for the embellishment of the new Palace at Westminster were exhibited to the public. August 22, a great Repeal Meeting held on the hill of Farn. August 28, the Queen and Prince Albert embarked at Southampton, on a visit to Louis Philippe at the Château d'Eu; on September 13, they visited the King of the Belgians at Ostend. August 17, an Act for the pacification of the Scottish Church received the royal assent, but no effect in staying the disruption. August 24, parliament was prorogued. August 29, Father Mathew holds a great Temperance meeting in London, and in the course of a few weeks administers the pledge to 74,000 persons. On September 9, the French took possession of Otaheite. September 15, Maharajah Shere Singh, ruler of the Punjab, was assassinated with his family, at the instigation of his minister Dhyan Singh. September 28, the Anti-Corn-Law Association renewed its meetings in London. October 7, the Irish government issued a proclamation forbidding the Repeal meetings, and O'Connell recommends submission. On the 14th, Mr. O'Connell, his son, and several other Repeal leaders, are arrested and held to bail on a charge of conspiracy and sedition. October 27, the Welsh special commission opened at Cardiff for the trial of the Rebecca rioters, the principal culprit being a young farmer, who was sentenced to imprisonment for twenty years. Most of the others were let off, on pleading guilty, and on condition that the riots should cease. December 29, Gwalior, in the East Indies, invaded and subjugated by the Anglo-Indian army.

1844. January 29, the Grand Duke of Saxe-Coburg, father of Prince Albert, died. February 1, parliament was opened. February 12, after a trial which lasted twenty-four days, O'Connell and his companions were found guilty. A new trial being refused by the judges, on May 11, O'Connell was sentenced to a year's imprisonment and a fine of £2000; on September 2, the judgment was reversed, on appeal, by the House of Lords, and he was restored to liberty. March 5, Mr. Pritchard, the British ex-consul at Otaheite, was seized and placed in confinement, by M. Bruat, the French governor, whose conduct, after much contention, was subsequently disavowed by his government. April 12, a treaty of annexation proposed between Texas and the United States was rejected by the Senate. On May 11, a meeting was held under the presidency of Lord Ashley, for improving the habitations of the poor. June 1, the Emperor Nicolas of Russia visited England. June 6, the Factories Act, regulating the employment of children and young persons, received the royal assent. June 14, a discussion was raised in the House of Commons on the subject of Sir James Graham opening letters at the Post-office. He contended that he had the right, but would give no further explanation. The letters said to be opened were addressed to Mazzini, and the information thus obtained had enabled the Austrian government to seize the brothers Bandiera, who had landed in Italy for the purpose of creating an insurrection. A Committee of investigation was appointed by Lords and Commons, but they only reported that the power had been occasionally exercised. July 22, a treaty was signed between England and Hanover for the settlement of the Stade duties. August 8, a meeting was held in Manchester for the formation of public parks, and £25,000 were subscribed by November 1. September 5, parliament was prorogued. October 7, the King of the French arrived at Windsor on a visit to the Queen. October 28, the Queen opened the new London Royal Exchange. November 19, a meeting was held in Birmingham for the establishment of public parks and baths.

1845. Jan. 11, the Archbishop of Canterbury addressed a letter to the clergy of the Established Church, on the disputes raised by the introduction of Puseyite practices in the ceremonies of the Church, as to which he would not give an authoritative opinion, but recommended moderation. Feb. 4, parliament was opened by the Queen in person. On the 14th, Sir Robert Peel made his financial statement: he proposed to continue the Income tax, to repeal all duties on export, to abolish the duties on 430 articles which yielded only a trifling income, to take those on cotton-wool, glass, and leaves, and to substitute an annual licence for the auction duties: these were ultimately carried. March 6, Sir Robert Peel brought in a bill to enable Jews to hold municipal offices, which was passed on March 14th. May 5, a bazaar in aid of the Anti-Corn-Law Association was held in Covent Garden Theatre, by which 25,000£ was realised. On the 22nd a meeting was held in London for the establishment of baths and washhouses, under the presidency of the Duke of Cambridge. May 23, the Arctic expedition of discovery, under Sir John Franklin, sailed from Greenhithe, and, unfortunately, never returned. May 25, a terrible fire took place at Quebec, and on the 28th of June another. In the two fires 2947 houses were destroyed and 20,000 persons left destitute: parliament voted 20,000£ for their relief; subscriptions were raised, and collections were made in all the churches throughout the country. The Queen's letter. May 29, a new convention between England and France for the better suppression of the slave trade was signed. June 15, a French and English squadron attacked Madagascar, in consequence of the Queen of Madagascar having threatened the orders of those countries with expulsion; they destroyed some forts and part of a town, but nothing satisfactory was accomplished. June 30, Sir R. Peel's act for the endowment of Maynooth College received the royal assent; and on July 21, the acts for the establishment of museums in large towns, for the endowment of the new colleges in Ireland, and for the amendment of the Poor-Law in Scotland. August 9, the Queen prorogued the parliament, and on the same day, with Prince Albert, embarked at Woolwich on a visit to Germany. On their return they again visited Louis Philippe on Sept. 7 at the Château d'Eu. Oct. 31, Mr. Waghorn arrived with the East India mail, which he had brought for the first time by the Overland route. During this month the railway mania reached a crisis, and a panic ensued, by which many were ruined. November 19, the Irish Roman Catholic bishops condemn the new Irish colleges. Nov. 22, Lord John Russell issues his letter to the electors of London, declaring for a total repeal of the Corn Laws. Dec. 10, it having been previously understood that there had been many discussions in the cabinet on the subject of the Corn Laws, it was made known that ministers had resigned, and that Lord John Russell had been sent for to form a ministry. On the 20th, he having failed, Sir R. Peel was again sent for, and re-accepted office. Dec. 18, the Sikh army was beaten by the British at Moodkee; on the 21st the Sikhs were attacked at Ferozeshah and driven from their

Digitized by Google

entrenchments; and on the 27th the Sikh army retreated beyond the Sutlej.

1846. Jan. 3, the corporations of London and Dublin presented addresses to the Queen representing the sufferings caused in Ireland by the potato-rot of the previous year. Jan. 5, a meeting of agricultural labourers was held at Wootton-Bassett in Wiltshire, at which they petitioned for the abolition of the Corn Laws. Jan. 11, the New Zealand chiefs, who had previously committed several outrages on the British settlements, were attacked and defeated: on the 19th they made their submission. Jan. 22, the parliament was opened by the Queen, who referred to the failure of the potato crop, and recommended the consideration of the propriety of relaxing protective duties. On the 27th Sir R. Peel announced his intended repeal of the Corn Laws. Jan. 28, the Sikh army was again defeated at Aliwal, on the Sutlej, by the British forces under Sir H. Smith. Feb. 10, the British army, under Sir H. Gough, attacked the Sikhs at Sobraon on the Sutlej, defeating them with great slaughter after a most obstinate conflict. March 13, potatoes having risen to a famine price in Ireland, a treasury order was issued allowing the importation of Indian corn, rice, and buckwheat at a nominal duty of one shilling per quarter. April 4, the governor of the Cape of Good Hope commenced a war upon the Caffres, who had been committing depredations on the colonists. June 9, the town of St. John's, Newfoundland, was destroyed by fire; the damage done amounted to 1,000,000*l.* June 12, a treaty with the United States for the settlement of the Oregon boundary was agreed to by the senate at Washington. On the 26th the Corn Duties Repeal Act, and the Customs Duties Act, which gave great freedom to commerce, received the royal assent. On the same day, on the motion for the Second Reading of the Protection of Life (Ireland) Bill (a coercive measure for Ireland), the ministers were defeated, and immediately resigned. On July 6, Lord John Russell and other members of the new ministry were sworn into office. July 28, W. S. O'Brien and many others seceded from the Repeal Association, because O'Connell had denounced all attempts to obtain their object by physical force. August 26, an act for the establishment of Public Baths and Washhouses received the royal assent, and also the act for establishing County Courts. Sept. 4, twenty-four districts in Ireland were declared by proclamation to be in a state of distress, and the provisions of the Labour Rate Act were directed to be put in operation in them. Sept. 14, a formal protest was made by the British government against the marriage of the Duke de Montpensier, a son of the King of the French, with the sister of the Queen of Spain. Oct. 5, the distress in Ireland continued, and the government of the Labour Rate Act proving worse than useless, the lord lieutenant issued a circular authorising the undertaking of works of permanent utility. Dec. 18, the island of Labuan was taken formal possession of by the agents of the British government. Dec. 24, a meeting was held in Edinburgh to consider as to the best means of relieving the distress in the Highlands and Islands of Scotland, where 330,000 persons were without the means of subsistence.

1847. Jan. 2, the British Association established, by which large sums were raised by subscription for the relief of the distress in Ireland and Scotland, in both of which countries numbers were dying of starvation. Jan. 19, parliament was opened by the Queen, who directed the attention of the Houses to the great distress prevailing, and called on them to provide measures for its relief. Jan. 22, Daniel O'Connell died at Genoa, while on his way to Rome. June 8, the new Irish Poor Law received the royal assent; on the 21st, that for the improvement of towns; and on the 23rd parliament was prorogued. Oct. 17, thanksgivings were offered up in all the churches for an abundant harvest. Oct. 23, in consequence of a great monetary pressure, the temporary suspension of Sir R. Peel's Bank Restriction Act was ordered, and the order was withdrawn Nov. 23. Nov. 18, parliament re-assembled, and passed an act for the suppression of crime and outrage in Ireland.

1848. February 21, the revolution commenced in Paris by which Louis Philippe ceased to be king of the French. On the 24th the king abdicated. On the 26th the republic was proclaimed. Louis Philippe and his family fled, and arrived in England at the beginning of March. April 10, a proposed great Chartist demonstration on Kennington Common, near London. The government however had appointed special constables; an intended procession was prevented, and the affair passed off harmlessly. May 15, the affairs of Ireland commenced; the state of the country can not agree in a verdict as to Mr. O'Brien and Mr. Meagher. Mitchell was tried on May 22 for seditious writing in the 'United Irishman, found guilty, and sentenced to fourteen years' transportation. June 18, Lieut. Edwardes, with a small force, engaged and defeated the army of the Dewan Moolraj: a battle subsequent took place between the two Irish rebels and the government forces at Ballingarry: the rebels were easily defeated. On August 5, W. S. O'Brien was captured, and on the 12th Meagher, O'Donohue, and Lyne. Aug. 20, twenty Chartist leaders arrested in the Blackfriars Road. Aug. 29, Sir H. Smith defeated the rebels under Pretorius at Bloem Platte, in the Cape of Good Hope colony. Aug. 31, the Health of Towns Act received the royal assent. Sept. 30, the Chartist trials were concluded in London, and Dowling, Cuffey, and others were sentenced to transportation for life. October 9, the trial of the Irish rebels concluded, and O'Brien, Meagher, O'Donohue, and McManus were sentenced to death. October 17, the Punjaub was annexed to the British possessions in India.

1849. January 13, the Sikhs defeated at Chilianwallah by Lord Gough. February 21, they were again defeated and completely routed at Chenaub. May 11, on the appeal of Smith O'Brien and others to the House of Lords the judgment was confirmed, and on July 9, they were all transported. May 13, a large meeting held at Cape Town to protest against the attempt to make the Cape a penal colony. June 26, the act for repealing the Navigation Laws received the royal assent, and on the 28th the Irish Encumbered Estates Act. September 16, prayers offered up in the churches for the removal of cholera, which had been raging in England for some time. November 5, Russia and Austria demand the expulsion or imprisonment of the Hungarians lately engaged in the insurrection against Austria; Turkey asks the assistance of England, and a British fleet enters the Dardanelles. December 1, the Dowager Queen Adelaide died. December 16, a large assemblage of tenant farmers and cottiers took place at Mullinahone in Tipperary to petition for Tenant Right.

1850. January 10, the Enterprise and Investigator leave Woolwich in search of Sir John Franklin. January 25, a meeting held in the Mansion House, London, in furtherance of the Industrial Exhibition of all nations. February 27, Sir C. Napier, commander-in-chief in India, disbanded the 66th Bengal Native Infantry for mutiny. June 4, an attack made on the Queen by Lieutenant Pate, who struck her with a cane. July 2, Sir Robert Peel died, in consequence of a fall from his horse. July 26, Baron Rothschild, having been elected for the city of London, attended the House in order to take his seat, but was refused because he objected to take the oathe on the faith of a Christian. August 5, the act for regulating metropolitan interments, forbidding burials in church-yards, received the royal assent, as also an act for the better government of the Australian colonies, forming Victoria into a separate colony, and giving it a representative legislature. August 14, the act enabling town councils to establish public libraries and museums also received the royal assent. August 21, the Queen embarked at Osborne to visit the King of the Belgians. September 24, the pope issued a bull establishing a Roman Catholic hierarchy in England, which, on its promulgation, occasioned great agitation. October 8, Captain M'Clure, of the Investigator, discovered the North-West Passage by Prince of Wales's Strait. The ship was subsequently frozen up, and the crew were not rescued till April 1853, when they made their way over the ice to Melville Island. November 22, a meeting of the clergy of the Established Church was held at Exeter hall to protest against the bull, which was followed by public addresses for the same purpose to the Queen from various parts of the country. December 31, Sir Harry Smith, governor of the Cape of Good Hope, declared war against the Caffres. He had been attacked by them and narrowly escaped on the preceding day, and the Caffres defeated our troops in several places.

1851. January 27, Earl Grey in a despatch places the Clergy Reserves at the absolute disposal of the legislature of Canada. February 4, Parliament opened, and the Queen alluded to the Ecclesiastical Titles bill, as occasioned by the pope's recent bull. February 18, the trial of the London Dock Company for a fraud on the Customs ended this day by a verdict which was a virtual acquittal. February 22, the Russell ministry resigned, in consequence, as stated by Lord John, of the smallness of their majority against Mr. Disraeli's motion in favour of agricultural protection, and of Mr. Locke King having carried a motion against them in favour of the extension of the county franchise. On the recommendation of the Duke of Wellington the Russell ministry resumed their places on March 3. May 1, the Great Exhibition of the Industry of all Nations in Hyde Park was opened by the Queen. May 22, the governor of New South Wales issued a proclamation forbidding the search for gold in the newly discovered gold regions without a licence. By the beginning of June 20,000 persons were employing themselves at the diggings. August 1, the royal assent was given to the Ecclesiastical Titles Assumption and the New Metropolitan Cattle Market acts. September 27, the Submarine Cable Telegraph between Dover and Calais was brought into operation and was opened for public communication on November 13. October 23, Kossuth arrives at Southampton, on the 30th he went in procession to the Guildhall of London, where an address from the city was presented to him. November 6, the Caffres defeated a British force at Waterkloof. December 2, the Prince-President of France dissolved the legislative assembly, arrested Cavaignac, Changarnier, Thiers, and others, and on January 2, 1852, his continued authority was voted by 7,439,216 votes against 640,737.

1852. Jan. 1, the Roman Catholic synod of Thurles prohibited the Roman Catholic clergy from holding any office whatever in the Queen's colleges in Ireland. Feb. 3, the parliament met; on the 20th the ministry were beaten on the Local Militia Bill, and on the 23rd they resigned; they were succeeded by one under the presidency of the Earl of Derby, who, on announcing his acceptance of office on the 27th, deprecated the attempts which were being made to produce a panic-fear of invasion by the French. April 2, Martaban in Burmah was stormed and taken by the British, and on the 14th Rangoon was also taken. May 19, Bassein was taken. On June 1, Pegu, and on July 9, Prome, were taken by the British. April 13, Major-General Cathcart, who had superseded Sir H. Smith as governor of the Cape,

Digitized by Google

issued a proclamation recognising the independence of the Boers of the Vaal river. June 1, the electric telegraph between England and Ireland opened for communication. June 2, the independence of Greytown guaranteed by the English and American governments. June 30, the set granting a representative constitution to New Zealand received the royal assent. July 1, the parliament was dissolved. July 3, a great Tenant-Right meeting at Waringstown in Ireland, at which Mr. S. Crawford, M.P., attended, was dispersed by the magistrates. August 11, Queen Victoria arrived at Antwerp on her way to Brussels. Sept. 14, the Duke of Wellington died; on Nov. 18, received a public funeral in St. Paul's, ordered by parliament. Nov. 2, a great Free Trade banquet held at Manchester, which was attended by 3000 persons. Nov. 23, three ships arrived in the Thames with a large quantity of Australian gold. Dec. 4, the Burmese attempt to retake Pegu, but are repulsed with great loss; on the 30th Pegu is annexed to the British empire by a proclamation of the governor-general of India. Dec. 16, in the new parliament which had assembled on Nov. 4 the ministry were beaten on the budget by 305 against 286; they immediately resigned; and on the 27th the Earl of Aberdeen announced that he had accepted office, and formed a new ministry.

1853. Jan. 5, the Emperor of China legalised the importation of opium, in order to make it contribute to the revenue. March 9, a treaty with the Cafre chiefs completed by General Cathcart at the Williem's Town. April 1, a royal charter received at Manchester, constituting it a city. May 3, Prince Menzikoff presented the Russian ultimatum to the Turkish government, claiming for the czar the protectorate of the Greek Christians in the Turkish dominions, which was rejected. May 12, the Industrial Exhibition opened at Dublin. June 20, peace with Burmah proclaimed by the governor-general of India: the late king of Burmah had died, and his successor agreed to the terms proposed by the English. June 21, the Queen reviewed the troops encamped at Chobham. June 26, the Emperor of Russia issued a manifesto against Turkey, and announced the march of Russian armies upon its Danubian provinces. Sept. 27, Turkey declared war against Russia. Oct. 22, the French and English fleets entered the Bosphorus. Dec. 5, a protocol signed at Vienna by France, England, Austria, and Turkey, for the maintenance of the integrity of the Turkish empire.

1854. Feb. 13, Lord John Russell introduced to the House of Commons his new Reform Bill, which was abandoned on April 11, in consequence of the state of public business. Feb. 26, the Grenadier and Coldstream guards embarked at Southampton for Turkey, and other troops followed in rapid succession. March 11, the Queen reviewed a fleet at Spithead previous to its sailing for the Baltic. March 28, war declared by England against Russia. April 22, Odessa bombarded by the French and English fleets. May 1, the Queen visited Old Washington for facilitating the intercourse of the British North American colonies with the United States. June 8, the Crystal Palace at Sydenham opened by Queen Victoria. June 16, the act for doubling the income tax received the royal assent. August 7, the act for regulating Oxford University received the royal assent. August 16, Bomersund was surrendered to the allied fleet. Sept. 14, the allied army landed in the Crimea, after having suffered severely from cholera during this and the preceding month. On the 16th the Russians evacuated Moldavia, and the Danubian provinces were occupied by the Austrians. On the 20th the battle of the Alma took place, and the Russians were defeated. Oct. 17, the bombardment of Sebastopol commenced. Nov. 5, the battle of Inkermann, when the Russians were again beaten. On the 14th a violent storm destroyed many ships laden with stores, and caused great calamities on shore. This was followed by a season of great suffering: the roads were impassable; the weather was bitterly cold; meat and horses, ill supplied with food or shelter, perished in the camp; while medical attendance and hospital accommodation were wofully deficient. Great dissatisfaction was expressed at home, and private subscriptions to a large amount were raised to alleviate the distress. Miss Nightingale organised a staff of nurses, and proceeded with them to Constantinople to superintend the hospitals, and attend the sick and wounded.

1855. January 6, conferences between the plenipotentiaries of England, France, Austria, and Russia, were opened at Vienna. Lord John Russell was the English plenipotentiary, and his conduct in supporting the proportions of Austria for a peace with Russia, formed the subject of a parliamentary discussion on July 6, and led to his secession from office on July 13. January 10, Sardinia joined the allies, and undertook to send troops to the Crimea. January 29, Mr. Roebuck's motion for a committee to investigate the causes of the sufferings of the army in the Crimea carried against the ministry by 305 to 148. In consequence the Aberdeen ministry resigned, and on February 10 was succeeded by one of which Lord Palmerston was the Premier. March 2, Nicolas, emperor of Russia, died, and was succeeded by his son Alexander II. April 17, the Emperor and Empress of the French arrived at Windsor on a visit to the queen. May 24, Kertch occupied by the Allies, whose fleets swept the sea of Azoff, and destroyed several towns and a vast number of vessels. June 18, the French attacked the Malakhoff and the English the Redan, but were repulsed. July 1, a large assemblage of persons took place in Hyde Park to protest against Lord R. Grosvenor's Sunday Trading bill, and some rioting occurred. The bill was withdrawn on the next day, but the meetings and the riots were continued on the two following Sundays. July 11, Sveaborg, in the gulf of Finland, was bombarded by the allied fleets. August 14, the Metropolis Local Management Act, constituting a representative board for the management of the improvements of the whole metropolis, received the royal assent. August 18, the Queen and Prince Albert paid a visit to the Emperor of the French in Paris. September 8, the French captured the Malakhoff, and in the night the Russians evacuated the south side of Sebastopol, of which the allies took possession. September 29, the Russians assaulted Kara, and were repulsed by the Turks, assisted by Sir W. F. Williams, several other English officers, and General Kmety. October 17, Kinburn, at the mouth of the Dnieper, surrendered to the allies, and on the next day the Russians blew up the fortress of Oczakoff. November 26, Kara surrendered, and was restored to the Russians, after the defence of Sir W. F. Williams and the English officers were made prisoners, and treated with great kindness by the Russians. November 30, the King of Sardinia arrived at Windsor Castle on a visit to the Queen. December 19, the united kingdom of Sweden and Norway joined the alliance of the Western Powers.

1856. January 31, the Queen, on opening the session of parliament, announced the acceptance by Russia of the terms proposed for a general peace. February 1, Mr. Murray, the British minister to the Persian court, quitted Teheran in consequence of a dispute with the Persian government. February 7, the Queen, having created Sir J. Perke, one of the barons of the Exchequer Court, a peer for life only, a motion to refer the subject to a committee of privileges was carried against the ministers. The committee reported that such a peerage was no right to sit in parliament, which was confirmed by the House. Ultimately ministers gave way, and Baron Wensleydale was created a peer in the usual form. February 25, John Sadleir, M.P. for Sligo, having poisoned himself, an investigation led to the discovery of a series of enormous frauds, ultimately ruining the Tipperary Bank failed, and an immense amount of litigation and suffering among the shareholders followed. April 20, official proclamation made of the peace with Russia. May 3, an amnesty granted to the political exiles; Frost, Williams, Jones, Smith O'Brien, and others, subsequently returned to England. May 29, public celebration of the conclusion of peace; magnificent fireworks exhibited in London, Edinburgh, and Dublin, and a general illumination took place. July 12, the allies evacuated the Crimea. July 29, the act for establishing reformatory and industrial schools for criminal and vagrant children received the royal assent. August 20, the Queen of Oude arrived in England, to appeal against the annexation of her son's dominions to the British possessions in India. September 4, the Royal British Bank stopped payment; on the accounts being investigated gross frauds were disclosed: the failure caused a vast amount of distress and ultimately the attorney-general undertook to prosecute some of the directors; an act of parliament was also passed in 1857 to render trustees more easily punishable for misconduct and misapplication of funds. October 11, the seizure by the Chinese in the Canton river of the 'Lorcha' Arrow, gave rise to a series of attacks on Canton, from which place all the foreign commercial residents withdrew. November 10, in consequence of the Persians having taken Herat, in violation of a treaty, war was proclaimed at Bombay against that country. December 11, the collection of pictures belonging to Mr. John Sheepshanks was made over by him to the government as a gift to the nation. December 16, the Queen went to Spithead to receive from the government of the United States the Arctic discovery ship Resolute, which, having been abandoned in the ice by its crew, was found and recovered by an American ship, and now restored.

1857. January 27, the Indian army landed at Bushire in Persia, capturing the place with small opposition. February 2, the army advanced to Borajoon, where the Persians abandoned their camp and stores, and retreated; but endeavoured to intercept the British force on its return on February 7, when they were utterly defeated. On March 28, the town of Mohammerah was taken; but in the meantime a treaty of peace had been concluded at Paris on March 4, Persia agreeing to withdraw from Herat; and the war was ended. March 3, the ministry were defeated on a motion by Mr. Cobden, involving censure on them for the attack on Canton. Lord Palmerston then announced his intention of appealing to the country as soon as the indispensable business of the House could be got through. Parliament was dissolved on March 21, and a new one summoned, which met on April 30. In the new elections the most remarkable fact was that Mr. Bright, Mr. Cobden, and most of what were called the 'Peace Party,' failed in getting returned. March 14, the treaty with Denmark for the abolition of the Sound Dues was signed at Copenhagen. An indemnity was to be paid to Denmark, of which England's share was settled at 1,300,000*l.* and the dues ceased from April 1. May 5, the Art Treasures Exhibition was opened at Manchester by the Queen and Prince Albert. May 7, a mutiny broke out in the Indian army; six regiments revolted, took possession of Delhi, and massacred many of the English residents. The mutiny spread, and nearly all the Bengal army joined it. An emperor was proclaimed at Delhi, and a few Europeans and some faithful native troops assembled to besiege it. May 25 and 27, Commodore Keppel, with a British naval force, attacked a number of Chinese junks in Escape Creek, and on June 1, another attack was made on those assembled in Fatshan Creek, in

Digitized by Google

the Canton river. Both attacks were successful, numerous junks were destroyed, a quantity of cannon taken, and a large part of the enemy's force killed. June 17, the mutineers in India attacked Cawnpore, but were repulsed. They however renewed their attacks; the British commander, Sir Hugh Wheeler, was killed, and on June 20 the garrison was obliged to surrender to Nena Sahib, the Mahratta chief of Bhitoor, on an agreement of being allowed to depart for Allahabad. When they were embarked in boats on the Ganges for that purpose, cannon were fired on them, many boats were sunk, and those who landed were cut down. July 3, General Havelock marched against Cawnpore, and, after defeating the enemy in three battles, regained possession of the city 17. June 20, an order in Council directed that in future Prince Albert was to be prayed for in the churches and addressed as the Prince Consort. July 10, the Oaths Bill, by which Jews would have been admitted to parliament, was rejected in the house of Lords, after being carried in the Commons by a large majority. August 7, the laying down the Submarine Cable between Valentia in Ireland and St. John's, Newfoundland, was commenced. After laying down nearly 300 miles, the cable broke, and the undertaking failed for the present. [See SUPPLEMENT.]

VIDA, MARCO GIROLAMO, born at Cremona about the year 1490, studied at Padua and Bologna, and distinguished himself in the classical studies, and especially in Latin poetical composition. He afterwards entered the order of the regular canons of the Lateran. He went to Rome about the beginning of the pontificate of Leo X., who happening to see his little Latin poem on chess, 'Scacchia ludus,' and another entitled 'Bombyx,' or the Silkworm, took him into favour, and urged him to undertake the composition of a more important and regular poem on the life of our Saviour, and in order to enable him to apply himself undisturbed to his poetical studies, the pope bestowed upon him the priory of San Silvestro at Frascati. Vida accordingly began his poem entitled 'Christiados,' of which he presented two cantos to Leo X., who praised them greatly, but the poem was not finished for many years after. It was then published, in 1532, as a didactic poem 'De Arte Poetica,' which has been extolled by Scaliger, Batteux, and other critics, as being his best work. It has been translated into English, and has been praised by Dr. Johnson, and by Pope in his 'Essay on Criticism.'

Clement VII. appointed Vida apostolic protonotary, and in 1532 made him bishop of Alba in Piedmont. Ughelli, in his 'Italia Sacra,' speaks at length of the meritorious conduct of Vida during the thirty-four years that he administered the see of Alba. When the French besieged that place in 1542, the bishop assisted at his own expense the poor inhabitants, and supported the spirit of the garrison until the besiegers were obliged to raise the siege. Vida afterwards repaired to the Council of Trent, where he became intimate with the Cardinals Pole, Cervini, and Dal Monte, and with the learned Marcantonio Flaminio, and in the familiar conversation which he had with them he conceived the plan of his dialogues 'De Dignitate Reipublicæ,' which he afterwards published and dedicated to Cardinal Pole. In the year 1549, on the occasion of a dispute about precedence between the towns of Cremona and Pavia, the citizens of the former interested their townsman Vida with the defence of their claims, which were to be laid before the senate of Milan for its decision. Vida wrote three orations: 'Cremonensium Actiones Tres adversus Papienses in Controversia Primipatus.' In these compositions Vida gave way perhaps too much to municipal feelings, and indulged in invective against the people of Pavia, for which his orations were called Vida's 'Verrinæ.' Giulio Sal-ino, on behalf of Pavia, replied to Vida, in his 'Pro Ticinensibus adversus Cremonenses de Jure Possessionis,' which however were not printed, as the question was decided.

Vida died at Alba 27th September 1566, and was buried in the cathedral of that town. It seems that he died poor. Besides the works mentioned in the course of this article, he wrote sacred hymns in Latin, and other minor compositions both in Latin and Italian. Vida was one of the most learned scholars and most elegant Latin writers of the 16th century. His contemporary Sadoleto, a competent judge, affirms that his Latin verse approached near to the dignity of classical poetry. His poem on the Life of Christ, in six books, is a close imitation of Virgil, for which the author was styled 'the Christian Virgil.' Vida wrote also a small poem on the challenge and fight between thirteen Italians and the same number of Frenchmen in Apulia, in February 1503, in which the Italians remained victorious. Of this inedited poem a fragment was published at Milan in 1818: 'Marci Hieronymi Vidæ XIII. Pugilum Certamen.' There is an account of this same occurrence in Italian prose: 'Istoria del Combattimento de' tredici Italiani con altrettanti Francesi, fatto in Puglia trà Andria e Quarati,' by a contemporary and a spectator of the fight, which has furnished the subject of Ariosto's historical novel, 'Ettore Fieramosca o la Disfida di Barletta.'

(Corniani, *I Secoli della Letteratura Italiana;* Tiraboschi, *Storia della Letteratura Italiana;* Giraldi, *De Poetis Suorum Temporum;* and the biography of Vida, in the edition of his works published at Oxford, 1722.)

VIDOCQ, FRANÇOIS-JULES, the chief of the detective brigade (Brigade de sureté), at the prefecture of the Paris police, established in 1812, whatever must be thought of his early life as a thief and inmate of the convict yards, undoubtedly did real service to France, by his active pursuit of the marauders, who levy contributions on their neighbours' goods. He was born at Arras, the chief town in the department of the Pas de Calais on the 23rd of July 1775. His father was a baker, and was chosen to supply the local government, during the revolution, with bread, flour, &c. Young François was employed in the business before he was thirteen; but formed acquaintances who led him to purloin his father's money by means of several artful contrivances. These being detected, the boy began to pilfer the stock, spending the proceeds with his companions at a neighbouring wine shop. A watch was at length set over him; which did not prevent his stealing ten silver forks and spoons, and pledging them. For this offence his father gave him in charge to the police, and he was sent to the House of Correction for a few days. While in confinement he was incited by a young fellow-prisoner to rob his father again, by picking the lock of the till, and taking out the whole contents, amounting to 80*l.* Having divided this money with his accomplice, he left Arras, intending to sail for the United States; but the high price of the passage made him change his mind; and being at Ostend a few days after, he was plundered by a sharper of all his ill-gotten gains.

In this state of destitution, he hired himself to an itinerant showman, who kept a small menagerie. His allotted task consisted at first in sweeping out the cage and the reception room. His master, after promoting him to the rank of tumbler and acrobat, wanted him to play the part of a savage who eats raw flesh and drinks blood. The wretched boy refused to undertake this new character, and was discharged. His next took service with the master of a puppet show; from whom he passed into the hands of a peregrinating quack-doctor. At length weary of this hard probation of vagrant life, which had lasted two years, the seeming penitent returned home, and a kind old father's pardon prevailed on his father to forgive him and receive him. This was in 1791, in his 16th year.

But he was too idle and restless for regular work; so he enlisted (after one or two escapades), in the regiment of Bourbon, and set out for Belgium, then the seat of war, now war, between France and Austria. He was present in several actions, and he made a corporal; but, having quarrelled with his drum-major, and challenged him to fight, he deserted to avoid a court martial. He then enlisted in the 11th chasseurs, and fought at the battle of Jemmapes, November 6, 1792. Having distinguished himself in the capture of Longwy, under Kellermann, October 20, 1792, and being of unusual stature for his age, he was made a corporal of grenadiers. A day or two after he was recognised as a deserter, when he made his escape to the Austrian outposts. Unwilling however to fight against his own countrymen, he counterfeited illness, and began to teach fencing.

After a short stay with the Austrians, he got back to France, entered the 14th regiment, and then returned to the 11th, being present at several actions, and being wounded three times. One of his wounds obliged him to return to Arras, where in consequence of a quarrel he was denounced to the Revolutionary Tribunal as a 'Modéré,' and thrown into prison. However he was soon after released, owing to the good offices of Mademoiselle Chevalier, the daughter of the notorious Joseph Le Bon. He married her in 1793, but they separated almost immediately. The next year he went to Brussels, became a professed gambler, made love to a countess under a feigned name, and repenting of his treachery or fearing punishment for bigamy, just as he was about being married to her, confessed the imposture, was rewarded with a considerable sum of money, and set off to Rouen, and thence to Paris, which he entered for the first time in 1796, at the age of twenty-one.

He had not been in the capital many weeks, before the dangerous society of gamblers, swindlers, and loose women, left him once more penniless; which compelled him to return to the army of the north. Several fresh instances of folly, three imprisonments, and as many escapes, succeeded; after this he was confined in the prison of Douai, where he remained eight months. During his confinement, he was mixed up in a case of forgery, which in his autobiography he tries to explain as an act of inadvertence, rather than of guilt. For this however he was tried, convicted, and sentenced to eight years' penal servitude at the galleys. As they conducted him, bound to the chain, he excited a revolt among the convicts, but this attempt to escape having failed, he reached Brest, and remained six years at the bagne. In this place he completed his studies of the manners, the *mœurs*, the habits of every class of thief. Two years before the expiration of his penalty, he contrived to escape from the convict-yard, assumed the name of Duval, and returned to his own neighbourhood, where he became an usher to a school at Ambricourt, near Lille. He was soon re-captured, and sent to Toulon. From this convict-yard, he then made what he calls "his finest escape." After this he joined a band of freebooters in the south, who plundered the stage-coaches on the highroads. But these malefactors having detected the brand of the convict on his shoulder, dismissed him from their company, having first made him swear not to betray them. He resolved to be revenged; and this incident became the turning point in his fortune.

As he was making for the north, Vidocq, having no passport, was arrested and taken before a magistrate, to whom he offered to give such intelligence as would enable him to surprise his late comrades in the act of plunder. For this purpose, he applied for a temporary

Digitized by Google

release. But the magistrate demurred. "Suppose, on my way to prison," said Vidocq. "I get away from my keepers, come back to you, and resume my bondage, will you then grant me the provisional freedom I now solicit?"—"Yes," replied the judge. He escaped, and made good his offers to assist justice. This service was followed by others far more considerable. These events took place in 1804, but he continued for several years the slave of his antecedents. In 1806 he went to Paris again, where he maintained himself by following the handicrafts which he had learned during the course of his nomadic life. He became a toy manufacturer, a dealer in hardware, and a tailor; but other thieves, who had known him in prison, and who were well acquainted with his embarrassments, left him no repose; sometimes they wanted money, at others they proposed a good bargain; next it was some plunder to be hid. On one occasion they borrowed his cart, to convey the body of a murdered victim to a place of safety. His state in the end became intolerable.

In 1809, driven to extremity, Vidocq presented himself before M. Henri, the commissioner of the secret police of Paris, acknowledged his critical condition, and offered to give valuable information in case he might be allowed to come and go freely. This proposal was not accepted until his solicitations had been several times renewed, in the midst of which he was once more arrested. On this occasion he was sent to Bicêtre, when M. Henri, interested by his perseverance, and struck with the pointed nature of his proposals, which he continued to make by correspondence, at last consulted the Minister of Police, Pasquier, who returned a favourable answer, in which Vidocq was instructed to furnish information. His revelations then became so numerous and so important, that his liberty was granted him not long after.

The qualities he displayed in his new functions, soon attracted attention. Few detective officers ever possessed so much presence of mind, keen intelligence, bodily strength, courage, and diligence; besides that fluency of slang and banter, which is the eloquence of the vulgar. He made it a point, from the outset of his new vocation, to produce at once the culprit and the proofs of his crime. The receivers of stolen goods found in him a more relentless enemy than the thief. At first he held but a humble employment under the regular police officers; but, in 1813, he was withdrawn from their control and placed under that of M. Henri alone. His captures were extraordinary. The famous thief Delzève, and Folard, the robber who afterwards stole the medals of the Royal Library, were surprised at their work, and handed over by this secret agent to justice. La Courtelle, a sort of St. Giles's, infested with the worst vagabonds, was purged: the great burglar, Desorgues, and thirty-two of his associates, were taken. About the same time, the famous brigade of detective police (Brigade de Sûreté), directed by Vidocq, was formed, consisting at first only of four men; in 1817, the number rose to twelve; and in 1824, when its complement was full, it contained twenty-eight detectives. "It was with this limited force," says Vidocq, "that I had to watch and look after 1200 returned transports, and issue every year from four to five hundred writs." In the single year 1817, he effected 772 arrests, and 39 seizures of stolen goods. His useful brigade cost but 50000 a year, of which he enjoyed a salary of 6000 francs; the whole term of his official employment, he was the butt of continual charges, suspicions, and open accusations. He was said to take part in every crime, to incite robberies for the sake of arresting his dupes, and to have a share in all the plunder. This obloquy rose so high as to length to alarm the government, and in 1825 he was superseded in his functions by Lacour, whose antecedents resembled his own. In 1826 he established a paper manufactory at Saint-Mandé; and in 1827 he wrote his autobiography, which was published in Paris, by the bookseller Tenon, in 1829, in 4 vols. 12mo. It was considered by the detect some of the political agitators of the day, but his vocation was not either permanent or precise. Then, in 1834, he set up an office for information on behalf of Trade and Commerce, the object being to enable the fair trader, when applied to for credit, to ascertain the degree of trust to which the customer was entitled. In 1844, stimulated by the success of Eugène Sue's 'Mysteries' at Paris, and certain works of the same questionable character, which had appeared in London, he republished his *Mémoires*, under the title of 'Les Vrais Mystères de Paris.' The morbid taste for notoriety of crime, which then seemed to exist, induced Vidocq to visit London, and exhibit himself, with many curious articles used by French burglars, in the rooms of the Cosmorama in Regent Street. But this speculation did not answer his expectations. Soon after he fixed himself in Belgium, where he died in 1850.

VIEN, JOSEPH-MARIE, one of the most celebrated French painters of the 18th century, was born at Montpellier, June 18, 1716, and was the pupil of various painters, among them A. Rivals, of Toulouse, and finally C. Natoire, at Paris, whither he repaired in 1740. He was very sickly in his youth, and his parents thought that even the fatigue of the drawing-board was more than his strength could bear, and endeavoured to lead him to other pursuits; his own enthusiastic devotion to art however got the better of all obstacles, and in the year 1743, he competed successfully at Paris, for the grand prize of the French Academy, and obtained accordingly also the government pension for Rome. The subject of the picture was the Plague of the Israelites in the time of David. In 1744 he departed for Rome

and remained there until 1750, when he returned to Paris. Besides numerous studies he painted many excellent pictures during his six years' residence in Rome, including several church or altar pieces of great merit, as the Slaughter of the Innocents, St. John for the town of Montpellier, and the only two pictures by Vien now in the gallery of the Louvre, Saint Germain and Saint Vincent receiving the Crown of Glory from the hands of an Angel, and the Sleeping Hermit.

These were followed by a long series of works at Paris, many of them compositions of the highest pretensions, and indicating a decided revival in the French school of painting from the insipid puerile state to which it had been reduced by Vanloo and Boucher. The pictures of Vien approach the style and manner of the Bolognese scholars of the Carracci, though for some time his works were much maligned by the scholars of Boucher and Vanloo, and among them his own master Natoire. His St. Denis preaching to the Gauls, one of his best works, was pronounced by them inferior to the picture by P. Doyen of the Miracle des Ardens, illustrating the tradition of the miracle performed by St. Généviève when by her prayers she arrested the conflagration of Paris, which was caused by lightning in the year 1129. Vien's picture was placed in the church of St. Roch, where Doyen's is also now placed: they are nearly the same size, being about 24 feet high by 13 wide. In a few years however, and before the French revolution, Vien was justified by his contemporaries, who gave him the title of regenerator of painting in France: Count Caylus had always been an admirer of his genius. It was his object to restore the study of the antique, and of which he was pre-eminent in the works of the best Italian masters, and he succeeded to a considerable extent in both respects; but his admiration for the antique was carried to the utmost extreme by his pupils, Vincent and David and their scholars.

Vien was elected a member of the French Academy in 1754, when he gave as his presentation piece, a picture of Dædalus attaching his Wings. In 1775, after the painting of his picture of St. Denis, which was exhibited in the Louvre in the previous year, he was decorated with the Order of St. Michel, and was appointed Director of the French Academy at Rome, where he resided from that time until 1781, and was elected in the mean while member of the Academy of St. Luke. After his return to Paris he became one of the rectors and Director of the Academy there (he had previously been professor), and he was finally appointed principal painter to the king in 1789. This post he of course lost at the revolution, but he was from its foundation a member of the Institute of France; he was also created by Napoleon a member of the senate, a count of the empire, and a Commander of the Legion of Honour. He died at Paris, March 27, 1809, having nearly completed his ninety-third year, and he was buried in the Pantheon. He painted until within a year of his death. Vien's pictures are very numerous, amounting to little short of two hundred; this number would not be great, if many of them were not of very large proportion. Few of them have however been engraved. Of St. Denis, already mentioned, which is by some considered his masterpiece, has been engraved only in outline by C. Normand for the 'Annales du Musée,' published by Landon, and in the 'Musée de Peinture,' by Réveil and Pierre. Others have been from various subjects, but chiefly from the Sacred Scriptures, from ancient and modern history, and from Greek mythology. Among his more celebrated pictures are:—Julius Cæsar contemplating the Statue of Alexander at Cadiz, and regretting that he was still unknown at an Age when Alexander was already crowned with Glory; the Consecration of the Equestrian Statue of Louis XV.; Marcus Aurelius causing Provisions to be distributed among the People; St. Louis vesting the Regency of the Kingdom in his Queen, Blanche of Navarre; St. Peter Nolasco, Founder of the Embarkation of Christ bearing the Resurrection of Lazarus; the Virgin attended by Angels; St. Gregory; Briseis in the Tent of Achilles; the Parting of Hector and Andromache; Hector exhorting Paris to go out to battle; Venus wounded by Diomede; Æneas pursuing Helen during the burning of Troy; Andromache showing the Arms of Hector to her Son; Mars forcing himself from the Arms of Venus; Cupid and Psyche; Sappho playing on her Lyre; Proserpine adorning the Statue of Ceres; Cupid flying from Slavery; a Woman selling Cupids; and a young Greek Girl concealing her Bosom with a Scarf.

Vien has left also many drawings, some in series, as:—The Sports of Nymphs and Cupids, in 20 pieces; the Vicissitudes of War, also in 20 pieces; and the Union of Cupid and Hymen, Love and Marriage, in 36 pieces. There are also some etchings by Vien: he executed a set from a series of designs of the Adventures of Lot and his Daughters; and a Fête or Masquerade given by Vien and other students of the French Academy at Rome, to the Cardinal de Larochefoucauld in 1748: it is in 32 pieces, under the following title—'Caravane du Sultan à la Mecque, Mascarade Turque donnée à Rome par Messieurs les Pensionnaires de l'Académie de France et leurs Amis, au Carnaval de l'Année 1748; Jos. Vien inv. et sc.'

MADAME VIEN, born Marie Reboul, was a distinguished painter of birds, flowers, and still life; and was a member of the old French Academy of Painting. She died in 1805, aged seventy-seven.

JOSEPH-MARIE VIEN, the Younger, the son of M. and Madame Vien, though a distinguished portrait-painter, practised only as an amateur. He was born at Paris, in 1761. He exhibited several pictures in the

Digitized by Google

Louvre during the first quarter of the present century: among them a portrait of his father, as M. Vien, sénateur, in 1804.

(Gabet, *Dictionnaire des Artistes de l'École Française au dix-neuvième Siècle*; Fiorillo, *Geschichte der Mahlerei*; Landon, *Annales du Musée*; Réveil et Duchesne, *Musée de Peinture*, &c.; Brulliot, *Dictionnaire des Monogrammes*, &c.)

VIETA, FRANCIS. Much has been said of the writings of Vieta, but very little on his life, and that little has often been wrongly given. In the absence of all good sources of reference, we are under the necessity of giving somewhat more space to this biography than is usual.

François Viet, Vietæ, or de Vieta (his name is given in these ways, and in none of his own writings it is Latinised Fr. Vietus, but more usually Vieta), was born at Fontenai-le-Comte, a small town not far from La Rochelle, in the year 1540. His family, if we may judge from the position which he occupied during the greater part of his life, must have had both rank and interest. We may connect the epoch of his birth with other parts of the history of science, by stating that he was born about the time when algebra was introduced into the northern parts of Europe from Italy, in the thirty-ninth year of the age of Cardan, and three years before the death of Copernicus, while Napier, Harriot, and Galileo were respectively 10, 20, and 24 years his juniors. Of his education and early years we know nothing, and the scanty materials for the rest of his life are found principally in the work of his friend the president De Thou ('Hist.,' lib. cxxix.). Bayle charges this celebrated writer ('Dict.,' art. 'Rasario') with inaccuracy in his accounts of learned men; if we may disregard this attack made in the case of Vieta, with whom the biographer was personally and intimately acquainted, we cannot all the more help wishing that the facts preserved had been more in number, and of somewhat closer connection with the scientific pursuits of Vieta. The whole of De Thou's account does not amount to more than a few insulated anecdotes, which are often repeated; and the want of information from other quarters respecting one of the greatest mathematicians of the 16th century, may be accounted for if we remember the troubled times in which he lived, and the rule which he appears to have followed of printing all his works at his own expense, and distributing them as presents among his friends. This has been found almost uniformly to be a successful mode of preventing or diminishing posthumous fame.

The life of Vieta was passed in the public service: on the resignation of De Thou, he was made master of requests. We have seen it said that he held this office under Henry III., and elsewhere that it was in the household of Margaret, wife of Henry IV. Both statements are probably true; since De Thou assures us that his attendance to the mathematics was only the relaxation of a whole life spent in public business, for which, says the historian, he had both talent and industry. And Vieta himself, in his answer to Adrian Romanus, says that he cannot profess to be a mathematician, but only a person to whom mathematical studies are delightful when he has leisure. He lived and held office through the religious troubles of the reigns of Henri III. and Henri IV.; a letter of his friend Ghetaldi, hereinafter mentioned, proves that he was on the council of state in the latter reign, and we must suppose that his love of study induced him to confine himself to the simple duties of his calling. It seems however that he did not entirely escape the dangers of the time, or the attacks of the opposite party. In his dedication to Catherine de Parthenai, duchesse de Rohan, and mother of the Duc de Rohan, well known as the leader of the French Protestants in the time of Louis XIII., he addresses that lady as one who had saved him from imprisonment and certain death; which means, we suppose, that he had fallen into the hands of the Huguenots. He proceeds to aver, but whether this be fact or dedication we have no means of knowing, that it was her love for and great skill in mathematics which first incited him to that study. Her literary attainments are mentioned by her biographers, and the account given by Vieta may be perfectly true. There is only one story in De Thou of his political services:—The extent and scattered character of the Spanish dominions having rendered their communications insecure in time of war, a cipher was invented with more than 500 characters, and these not permanently retaining the same signification. The complexity of this method foiled the ordinary decipherers, and application was thereupon made to Vieta, who without any difficulty discovered the secret, which was used for more than two years, to the great loss and annoyance of the Spaniards. These, perceiving that their cipher was detected, and imagining that no human skill was equal to such an effort, attributed the discovery to magic, and took care to publish this report throughout Europe, but particularly at the court of Rome. But the imputation failed to excite any odium, and was received, says De Thou, *non sine risu et indignatione rectius sentientium*; heresy had taken the place of sorcery. It is therefore not true, though some writers have said it by way of mending the story, that Vieta was actually cited to appear at Rome and answer the charge of dealing with the foul fiend.

Indirectly connected with the politics of the day is the share which Vieta took in the controversy on the reformation of the calendar. This, as is well known, was completed under the auspices of Pope Gregory XIII., in 1582, though the subject had been in agitation more than a century, and the change had even been projected by Sextus IV., in 1474. The plan finally adopted was that of Lilius, an astronomer of Calabria, who died before its presentation to the pope, and the execution of it was intrusted to the Jesuit Clavius. It is to be remembered that the true time of keeping Easter was then thought of the utmost importance, and that heterodoxy in this particular had more than once been thought worthy of excommunication. The reformed calendar was attacked by Vieta, Joseph Scaliger, and others, the first of whom published in the year 1600 what he called the true Gregorian calendar, and prefixed to it the bull of Gregory XIII. On this work it will be sufficient to say that Montucla and Delambre unite in condemning the ideas of Vieta: he made 3400 Julian years contain exactly 42 053 lunations, the error of which is a trifle more than that of the astronomy of his time. His work was carried by himself to Cardinal Aldobrandini, who was then at Leyden on a mission from Clement VIII. He had however no success with the cardinal, "as I warned him when he set out," says De Thou, "feeling sure that an improvement adopted by the princes of Christendom after so much deliberation, would not easily be modified, even for the better, by those who think it a secret of government never to confess that they either have erred or can err." Clavius simply replied to Vieta by referring him to a work on the Gregorian calendar which he was then preparing, and which he stated would contain a full reply to all the objections. This answer seems to have enraged Vieta beyond his powers of forbearance. Perhaps he felt indignant at not being considered worthy of a separate reply, or perhaps the malady which afterwards destroyed him had begun to act upon his mind—which last supposition is charitably hoped. In 1602 he published his accusation against Clavius, a tract of three pages, which Montucla is surprised his editors should have permitted to descend to posterity. He charges his opponent with evasion, and asserts that he ought to have retracted his error for the sake of the mysteries of religion, the peace of Christendom, and the divine authority of the supreme pontiff. He accuses Clavius of having slandered him to the pope, of contempt of religion, of falsehood in mathematics and theology; and urges upon him the danger that the Protestants might, through his obstinacy, get hold of the real calendar (this error is therefore not to be found in the papal authority. He calls upon Clement to alter the bull of his predecessor, and brings forward, curiously enough, as a precedent, that Augustus Cæsar, a Pontifex Maximus, had changed the arrangement of the year ordained by Julius Cæsar, another Pontifex Maximus. Finally, in order that no temptation to evil feeling might be wanting, he calls upon the order of Jesuits to excommunicate all who should by design and fraud stand in the way of the good of Christendom; meaning, of course, Clavius and his followers. To this explosion of passion Clavius did not condescend to reply; but Scaliger's reply to Vieta, which appeared in 1603, the year of Vieta's death, he treated the latter with the respect due to his genius. De Thou gives a partial friend's account of this controversy; for he says that on the refusal of Clavius to adopt the emendations of Vieta, the latter sent him a furious expostulation, and that had Vieta lived, the matter would not have stopped there, since those who did not hesitate to pluck at the beard of a dead man, would have beaten the living one, had they dared. The anonymous author of the life of Vieta in the 'Biographie Universelle' has followed De Thou in the preceding description of the conflict

What more we have to say of Vieta must appear in connection with his friendships or his writings. He died at Paris in 1603, according to De Thou: Weidler says December 13, but without stating from whence. Of his attachment to study the former writer says it was so excessive, that he often continued for three days together, fixed in thought, without stirring from his chair, or taking more sustenance or sleep than nature absolutely required. His religion he appears to have been a zealous Roman Catholic, at least towards the end of his life, and in politics a confirmed believer in the divine right of kings. The assassination of Henry III. seems to have dwelt upon his mind for years, so much so as to recur to it in his writings, in places where political allusion is a curious kind of digression. Thus, at the end of his 'Responsa Mathematica,' published in 1593, he suddenly breaks off from the subject of the Calendar to refer to that event, which took place in 1589: 'Sed de iis tollandis ad ecclesiasticos ea feram commodiore loco, ac ipsis datagum percipiam quæ summo ipsorum applausu mirum solis et lunæ consensum prodat *sis lapsi ἐνιαυτοῦ*. Sed,

> "Ebræ! quis unctum chrismate mystico
> Necara regem, sacrilega manu,
> Ausus cucullatus sodalis
> In numerum colitur Deorum!
>
> "Pii haud vacillent, ECCE MALUS BOSIS.
> Tremunt presages, ECCE SONUS MALIS
> Non corpetur nomen sodali
> Omen at imposuit refendo,"

The allusion in the verses is to Jacques Clement, who after the assassination of the king was considered as a saint by his party.

This article is the proper place of reference to two minor mathematicians, who are hardly worth separate articles, but who owe some of their fame to their connection with Vieta:—Adrian van Roomen, and Marino Ghetaldi.

Adrian van Roomen, commonly called Adrianus Romanus, was born at Louvain, September 29, 1561, and died May 4, 1615 (1625?). He published various works, of which the names may be found in Vossius 'De Scientiis Mathematicis.' The story of his acquaintance with Vieta is told by De Thou, but more in detail by Tallemant des Réaux, whose 'Historiettes' (written before 1657) were published at Paris, in 6 vols. 8vo, 1834-35. In his 'Idea Mathematicæ,' &c. Antwerp, 1593, Romanus proposed a problem to all the celebrated mathematicians whom he knew by reputation, naming them, but without a Frenchman among them. Shortly after, the ambassador of the States being at Fontainebleau, in conversation with Henry IV., who was enumerating to him the celebrated men of the country, said, "But, Sire, you have not a mathematician, for Adrian van Roomen does not name one Frenchman in his list." "Indeed I have, though," answered the king: "and an excellent one—let me name one call M. Viète." Vieta came, was presented to the ambassador, who gave him Van Roomen's problem, placed himself at a window, and, before the king left the room, wrote two solutions with a pencil. In the evening he sent several others, offering more, as he said the problem was capable of any number. Van Roomen, immediately on hearing this, set off to Paris to see Vieta, followed him to Fontenay, and spent some weeks with him. We shall see more of his problem presently. Tallemant, who was evidently not a mathematician, tells us the sort of impression which Vieta's writings had created about the middle of the 17th century. He says that this M. Viète, who had learnt mathematics by himself, there being nobody to teach him in France, wrote treatises so difficult that no one of his age could understand him; that one Lansberg, if he mistakes not (but he does mistake), first deciphered some of them, and that since his time people had made out the rest. It is worth noting that this same Tallemant is a witness independent of De Thou; for he informs us that Vieta died young, of study, whereas, had we taken De Thou's account, he would have found in the very first words that Vieta died "anno climacterico." And yet Alexander Anderson, who must have known his friend's age, calls his death, "fetum immaturum."

Marino Ghetaldi, of Ragusa, was of a good family, but of his life we can find nothing; nor of his death, except that it took place before 1630. Tallemant, already cited, says that a Ragusan gentleman, called Gaitade (Ghetaldi), procured himself to be made minister of his native republic in France, that he might have the acquaintance of Vieta. Ghetaldi, in the letter already alluded to, says he was at Paris on his own affairs when he first met with Vieta. The works of Marino Ghetaldi are—1, 'Nonnullæ Propositiones de Parabola,' Rome, 1603; 2, 'Promotus Archimedes,' Rome, 1603, a work on specific gravities, which is somewhat based on matters of weights and measures; 3, 'Apollonius Redivivus,' Venice, 1607; 4, 'Supplementum Apollonii Galli,' Venice, 1607, in continuation of the tract of Vieta presently mentioned; 5, 'Apollonius Redivivus' (the second book), Venice, 1613; 6, 'Variorum Problematum Collectio,' Venice, 1607; 7, 'De Resolutione et Compositione Mathematica,' folio (all the others being quarto), Rome, 1630 (posthumous). There is not much of algebra in Ghetaldi's writings, but what there is comes from the school of Vieta: the author so far bears out Tallemant's story, that he speaks of his intimate friendship with Vieta at Paris. Alexander Anderson (born at Aberdeen in 1582), who taught mathematics publicly at Paris, was the editor of two of Vieta's works, which came into his hands, one from the author, the other from his executors, as will presently appear. [Anderson, Alexander.] Nathaniel Torporley may also be named in this connection, he having for several years acted as Vieta's amanuensis. [Torporley, Nathaniel.]

It may perhaps save some bibliographical student a hunt for an imaginary work of Vieta if we mention here the 'Supplementum Fr. Vietæ, ac Geometriæ totius Instauratio,' Paris, 1644, by A. S. L. This A. S. L. is Antonio Sanctini of Lucca, who had a few years before published 'Inclinationum Appendix,' &c., with his name. At the head of his dedication he calls himself *Constantius Silanius Nicanæ* which is an anagram for *Antonius Sanctinius Lucensis*. The work itself is an impudent attempt to connect Vieta's name with pretended solutions of the problem of two mean proportionals, the multisection of the angle, &c. Both Sanctini's works were answered by P. P. Caregnadi of Milan, in his 'In Geometria, &c. Animadversiones,' Milan, 1650. Sanctini's algebra is of the school of Vieta. It is a striking corroboration of what may be suspected for other reasons, namely, how little Vieta was appreciated in France for many years after his death, that of all the persons we have mentioned as connected with him, not one is a Frenchman; but nevertheless some part of his works was translated into French by one Vaulezard: we know that this translation exists, but we cannot find any mention of it.

The writings of Vieta are rendered difficult to read by the then almost universal affectation of forming new terms from the Greek, and of introducing phrases in that language. His pages may remind the reader of the English fashionable novels of twenty years ago, which required a continual insertion of French words and sentences. Thus, in the *isagoge*, we find *zetetica*, *poristica*, and *exegetica* processes, the first consisting of *antithesis*, *hypobasmus*, and *parisotæsis*: and also that by an additional axiom, '*ατιμα non δυσμέγεθων*,' many problems hitherto '*ἄλογα*,' may be solved '*ἐυτέχνως*.' He uses the signs + and —, and also that for division; but when he would designate the difference of two quantities, one of which the sense is unknown, he places between them our modern sign of equality, thus, A = B. The exponents are expressed by words, either full or contracted; and the numerical coefficients are written after their accompanying letters. The analogy between algebra and geometry, which gave the name of square and cube to the second and third powers is extended to all symbols. Thus the equation $3BA^2-DA-A^3=Z$, would be written

B 3 in A quad.—D plano in A—A cubo æquatur Z solido.

Here D is called *planum*, and is considered as the representative of a geometrical superficies, that the second term may be homogeneous with the first: for a similar reason Z is *Z solidum*. And in various places it is expressly laid down, that it is not allowable to compare quantities which are not thus rendered homogeneous. The great difference between the method of Vieta and that of his successors is one in which lies much, if not the greater part, of the power of algebra: he was the first who used letters to signify known or determinate quantities, and he was the first who systematically combined the same mode of signifying unknown quantities with rules of operation. By this method the comprehension of a process which expressed in words would be long and complicated, does not cost the practised eye a second glance. It is true that the operations of those who preceded Vieta would lead to a correct numerical result in any particular case; but the same rules only appeared, when the *modus operandi* was set out or wrapped in the dusky folds of a verbal rule. The notation of Vieta expresses at once the rule and the result, and is a step in the advance of science which, for the magnitude of its consequences, must always be ranked with the invention of fluxions. There is much truth in the remark of Vieta upon his predecessors: 'Vovebant Heenbombas, et sacra Musis parabant at Apollini, si quis unum vel alterum problema extulisset, ex talium ordine qualium decadas et eicadas ultrò exhibemus, ut est ars nostra mathematum omnium inventrix certissima.'

We now proceed to a short account of the writings of Vieta, referring for more detail to the second volume of Hutton's tracts. Vieta, as we have said, printed his works privately, and we are not wholly able to recover the dates of the several first publications.

[But—we put this paragraph in brackets, as we first wrote it, for a reason afterwards mentioned—it is not noticed that many of these works, which are now only known by the edition of Schooten, were published together, or at least preceding publications were joined together in one, by Vieta himself, before the year 1591, under the name of 'Restituta Mathematice Analysis, seu Algebra Nova.' Neither Montucla, nor any other modern writer that we have seen, appears to be aware of this fact: the French historian does not seem to know that the first seven books of the 'Responsa Mathematica,' of which (i. 578) he regrets the loss, were contained in the collection alluded to. The fact is nevertheless certain, as the following editions of different separate works—viz., 'In Artem Analyticam Isagoge,' Tours, 1591; 'De Numerosa Potestatum ad Exegesin Resolutionis,' Paris, 1600; and 'Supplementum Geometriæ,' Tours, 1593—contain in their titlepages the name of the source from whence they were taken, and the first of them also gives a list of the contents, from which list we have placed R. M. before the titles of the following descriptions, in every case in which the 'Restituta Mathematica' is said to have contained the work. Besides these, we must reckon among the contents the

Digitized by Google

seven first books of the 'Responsa,' which have not come down to us, though tradition has preserved the name; and 'Ad logisticen speciosam notæ posteriores,' of which even the very name has disappeared from the history of algebra. We cannot help hoping that some old library may yet be found to contain this collection. Other writers take the words of the title in a sense between that of quotation and description. Thus Alexander Anderson says, "*Restitutum Mathematicum Analyzin* F. Vietæ debetis, *optimelvi*." And Walter Warner (preface to Harriot), "*Artis Analyticæ Restitutionem* F. Vieta aggressus est."[1]

We believe it will be shorter and clearer to leave the preceding passage in brackets (for which we thought we had very fair evidence), and to make a suspected correction, as another writer would do, in preference to mixing up the opinion (if it be a mistake) and the correction. The first publication of the 'Isagoge,' &c. (1591), bears on its title-page that it is 'Seorsim excussus ab *Opere* Restitutæ Mathematicæ Analyseos, seu Algebræ Novæ:' and on the reverse of the title-page appears 'Opere Restitutæ Mathematicæ Analyseos, seu Algebræ Novæ, continentur . . . . : *Operi* autem Præposita est sequens epistola.' Ten works are given by title, which may, all but the *seven books* and the *notæ posteriores* already noticed, be collected from the indication (R. M.) in the following list; and the epistle is the dedication to Catharine of Parthenai before alluded to. Blancanus (1615) places 'Opus Restitutæ,' &c., in the list of Vieta's works; and Morhof says that Vieta wrote "Isagoge, &c., *seu Algebra Nova*." Can any evidence be more positive to the fact that a work was published, or at least written out for publication? The absence of date or printer's name tells nothing as to that period; for these were then low, and did not require the minute accuracy of description which is now necessary to distinguish one work from another: moreover, whether this be the reason or not, such accuracy of description was not usual. Why then do we not continue to believe that such a work was published? Only the first place it is entirely lost, and with it the *Responsa* and the *notæ posteriores*, which is not likely to have happened to a large collection of Vieta's works; in the second place, Anderson, in his publication (which he gives us to understand was the first that was made) of the treatise 'De Recognitione,' &c., tells us something about Vieta's habits, which seem to explain the whole. "He was," says Anderson, "in the habit of referring to as finished" (*insignire* solebat), and by their names, works which, though undertaken in his own mind, and digested in order, were not even as much as fairly written down, owing to the interruption which his studies received from his public duties. This then may be the whole secret: Vieta gave a list of the works which he intended to publish, under the name which he intended to give them collectively. The seven books of the 'Responsa' and the *notæ posteriores* never, on this supposition, were published at all. And it will afterwards appear that there was a reason why the eighth book of the 'Responsa' should have been published without the rest; though it is singular, if the list above named be only of works intended, that this eighth book, which must have been as finished as the rest, should not have been mentioned. It is almost incredible moreover that Alexander Anderson should have published a few of Vieta's theorems, with his own demonstrations, as new, if Vieta had published them, and more, twenty years before.

(R. M.) *In Artem Analyticam Isagoge*, first published by Vieta himself, at Tours, in 1591. Here are laid down the principles of homogeneity before alluded to, and the common axioms used in the solution of simple equations. Many new terms are introduced, of which only two have lasted, namely, the distinction of equations into *pure* and *adfected*. The law of homogeneity is a fanciful deduction from certain well-known analogies between arithmetic and geometry, and the manner in which it is applied renders this book of Vieta somewhat obscure. The following is specimen of Vieta's barbarous current nomenclature (probably corrupt, *comparare non licet*), quia anguius est medium quidcam inter lineam rectam et planam figuram. Repugnare itaque videtur homogeneorum lex."

(R. M.) *Ad logisticen speciosam notæ priores*. The *notæ posteriores*, as just mentioned, are lost. *Logistice Speciosa* is the literal algebra, as distinguished from *logistice numerosa*, or common arithmetic. Here are various questions in algebraical addition and multiplication: the powers of a binomial are raised up to the sixth inclusive, and the law of the exponents is given, but not that of the coefficients. Particular notice is taken of the addition of powers of A+B and A−B, and, in a few cases, of the composition of $A^n - B^n$. Various methods are given of forming right-angled triangles whose sides shall be whole numbers.

(R. M.) *Zeteticorum libri quinque*. The first book contains problems producing simple equations, of which the following are specimens:—Given $x \pm y$, $x \pm z$, and the ratio of y to z, to find x; given the sum or difference of two numbers, and of given proportions of those numbers, to find the numbers. Here, as elsewhere, Vieta uses the capital letters only, and represents the unknown quantities by vowels, and the known quantities by consonants. The second book is full of those problems of the second and third degree, which produce unadfected equations, solved as in our modern works. The third book contains the reduction into equations and solution of questions in proportion, and also of right-angled triangles. The fourth and fifth books give the solutions of various of those problems now called Diophantine, mostly collected from Diophantus himself. We find here the first use of the vinculum connecting terms whose result is considered as a whole. Blancanus says that Cataldi explained this work of Vieta in what he calls "continuatio algebræ proportionalis," which cannot be the "nova algebra proportionale," Bologna, 1619, published after Blancanus wrote.

(R. M. as to the first, not the second.) *De Æquationum Recognitione et Emendatione libri duo*. First put together by Alexander Anderson, who obtained the materials from Aleimus or Alcanus (who had charge of Vieta's papers), and published these books at Paris in 1615. The first six chapters of the treatise *De Recognitione* are employed in demonstrating that equations of the second and third degree spring from questions upon three or four continued proportionals, except in the irreducible case of the latter species, which is shown to depend on the trisection of an angle. Where a rubble solution has been given, and that negative, the equation is deduced which has the corresponding positive root. The two roots of an equation of which one is negative are not considered, but the equation is deduced which has a positive root corresponding to the negative root of the former, and this equation is called contradictory to the former. Various methods are found by which an equation of a higher degree may be deduced from a given one, a synthetical process, apparently introductory to the subsequent depression of equations. In the treatise *de Emendatione*, Vieta lays down rules for destroying the second term of an equation of the second or third degree. His then shows, in a cubic equation which has the highest term negative, how to avoid this by a transformation which is in effect finding the equation whose roots are reciprocals to the roots of the former equation. We then find rules for entering into the various transformations; we will only remark generally, that an equation is considered unfit for use in which the highest power of the unknown quantity is negative, or has a coefficient, and that the greater part of his reductions employed were necessary to the modern analyst. These books leave the reader in possession of the methods then known for the depression or solution of equations of the second, third, and fourth degrees. They are a luxuriant exercise of the power newly derived from Vieta's improvements in notation. He concludes by showing how to construct an equation which shall have given positive roots: which form the suggestive basis of the subsequent discoveries of Harriot. On this he observes, "Atque hæc elegans et perpulcra æquationis ejusdem syllogo, tractatui aliquin effuso, finem aliquem et Coronida tandem imposuit." Dr. Hutton misconstrues when ('Hist. Alg. Tracts,' vol. ii.) he concludes from these words that Vieta only announces the theorem, "and for this strange reason, that he might at length bring his work to a conclusion." Nevertheless, Hutton's account is generally a very good one.

(R. M.) *De Numerosa Potestatum purarum atque adfectarum ad exegesin resolutione tractatus*. This work, first published, with Vieta's consent, at Paris in 1600, has at the end a letter (herein before referred to) from Ghetaldi to Michael Coignet, a Belgian mathematician, who states that at his earnest entreaty Vieta had consented to allow the work to be published, on conditiou that he (Ghetaldi) would take the trouble of editing it. This letter mentions the seven books of the *Responsa*, the *Harmonicon Cæleste*, &c. The *numerosa exegesa*, as the method herein explained was frequently denominated, passed through the hands of Harriot, Oughtred, and Wallis, with some improvements, but was so prolix, and required so much calculation, that when Newton's method appeared it gradually sank out of use. The late Mr. Horner of Bath reproduced it, with a capital improvement to the mode of making the successive computations, which will establish it permanently. Recently, Mr. Thomas Weddle of Newcastle, author of 'A New &c. Method of solving Numerical Equations,' has produced the kindred method of finding the highest denomination of the root, and correcting it by successive *multiplications*, instead of additions; a method which has considerable advantages when the degree of the equation is high. To return to Vieta: when the root is irrational, and any given degree of approximation is required, instead of using fractions, the equation is found whose roots shall be ten, or a hundred, &c. times the root of the given equation, which roots are then extracted by the method within a unit. The introduction of our notation for decimal fractions had not taken place at the time we are speaking of, though we should not be justified in drawing this conclusion from the mere fact of not finding it used by Vieta. From his avocations perhaps, but more from the imperfect modes of communication (for there were then no scientific associations), he appears not to have been perfectly aware of what was going on in other parts of the mathematical world. So that it is impossible to say, at present, whether some of the things which we know to have been discovered before his time, may not have been, as far as he knew, the fruits of his own investigation. "He neglects to avail himself of the negative roots of Cardan" (but this however was done, on principle, and from a determined refusal of all symbolical extension); "the numerical exponents of Stifelius, instead of which he uses the names of the powers themselves; or the fractional exponents of Stevinus; or the commodious way of prefixing the coefficient before the quantity; and such like circumstances, the want of which gives his algebra the appearance of an age much earlier than his own." (Hutton, 'Tracts,' ii. 273.) He had however seen the exponents of Stevinus, and the prefixed coefficients, for Van Roomen's problem, as given by himself, contains both.

(R. M.) *Effectionum Geometricarum Canonica Recensio* and *Supplementum Geometriæ*. The second of these works was first published at Tours in 1593. The former of these treatises is a collection of problems in common geometry, intended to facilitate the solution of problems of the second degree. The second treatise assumes the construction of the conchoid of Nicomedes; the finding of two mean proportionals, the trisection of an angle, the inscription of a regular heptagon in a circle, and the solution of the irreducible case of cubic equations are made to follow. The last of these is contained in the following proposition:—"If there be two isosceles triangles, having the equal sides of one equal to those of the other, and the equal angles of the second triple of those of the first, the square of the base of the first diminished by three times the parallelopiped under the base of the first, and the square of the common side, is equal to the parallelopiped under the base of the second and the square of the common side."

Pseudo-mesolabum. The term *mesolabum* was applied to any process by which two mean proportionals could be found between two given straight lines. By *Pseudo*-mesolabum Vieta means a process which, though not limiting itself to Euclidean geometry, nevertheless is effective on its own suppositions. A chord of a circle cuts a diameter, and a perpendicular from one extremity of the chord cuts the diameter produced, so that the part produced is equal to the chord. This being the case, the segments of the chord are mean proportionals between those of the diameter. When Vieta has finished his pseudo-solution (merely unpronounced), he then is ambitious of showing how well he can reason falsely, and ends with a *pseudo*-theorema (meaning one which is avowedly untrue, and given to be afterwards exposed). Now, if a man will write a pseudo-method, which he himself defines to mean no more than swallowed by fallacy, and makes his treatise to end in nothing but a *pseudo*-theorema (intended to be false), not even the closest examination will prevent every one from supposing that his pseudo-theorema is the *finis atque corona* of his pseudo-method.

(R. M. in which it is called *Analytica Angularium Sectionum in tres partes distributa*). *Ad Angulares Sectiones Theoremata καθολικώτερα*. This is really Alexander Anderson's publication. Vieta sent him the theorems, he found out the demonstrations, and published them, in 1615, at Paris, with a dedication to Duchesse, Prince of Wales. Among many trigonometrical theorems are here given some of the cases of which we shall presently speak with respect to Van Roomen's problem. The chord of an arc being given, the chords of its multiples and of their supplements are found.

Ad Problema quod omnibus mathematicis totius orbis construendum proposuit Adrianus Romanus Responsum. The circumstances under which Vieta first saw this problem have been already stated from Tallemant. It amounts to this: given the chord of an arc, to express algebraically the chord of the 45th part of that arc; but it is given in the form of a proposed equation of the 45th degree. If Vieta sat down at a window and solved several cases while Henry IV. and the Belgian ambassador were talking in the room, it must have been because he was then in full possession of his theory of angular sections, and saw at once that Van Roomen's problem was a particular case of it. But it must not be forgotten that the latter must also have been in possession of the same or of cases of it. This answer of Vieta is a full one, and appears to have been drawn up deliberately: he gives the complete reduction of the problem, with a good deal of what he must have supposed to be fun, but of a very ponderous and sober character. He ends by proposing, in his turn, a problem, evidently directed at Van Roomen, and by way of hit at his fearful equation and enormous coefficients, he says, "Pene ad ἀμηχανίαν usque non cruciandum studiosorum ingenia, problema hujus modi construendum subjicio." The problem is one of Apollonius, of which the solution had been lost,—Given three circles, to find a fourth touching them all.

Apollonius Gallus, seu exsuscitata Apollonii Pergæi vera ἐπαφῶν Geometria, first published by Vieta at Paris, in 1600, and addressed to Van Roomen. It has, in the beginning, a Greek epistle, anonymously addressed (perhaps by Van Roomen himself) Φαγγάνιος Οὐάτη, which is a presumption that the true pronunciation is Vieta. Van Roomen, as appears by the introduction, solved the preceding problem by the help of the hyperbola, on which Vieta rallies him in his manner, and proceeds to a geometrical solution. He then gives geometrical solutions of some problems which Regiomontanus had solved algebraically, but professed himself unable to solve geometrically. He calls himself Apollonius Gallus, and Van Roomen, Apollonius Belga; and from that time it became a fashion for those who had done anything after the manner of a particular Greek, to adopt the name of that Greek, with an adjective of country annexed. Thus Snell, after his measure of the earth, called himself Eratosthenes Batavus.

Variorum de Rebus Mathematicis Responsorum liber octavus. This book, first published at Tours in 1593, is preceded by an epistle from Pet. Da., whoever he may be, which explains why it appeared. Its scarcity (at least it is so asserted) that there was at that time a great excitement at Tours, not only among the educated, but even down to the lowest of the people, about the quadrature of the circle, the problem of two mean proportionals, &c.; and Pet. Da., who had seen Vieta, and knew that he had a book on the subject lying by him, solicited and procured its publication. We have already spoken of the first seven books, which, if they were ever written, are lost. This book contains the history of, and remarks on, the method of finding two mean proportionals, various modes of applying mechanical curves to the quadrature of the circle, approximate solutions of the same problem, and a collection of formulæ for the solution of triangles, with a short chapter on the calendar.

Munimen adversus Nova Cyclometrica. This was a refutation of Joseph Scaliger's asserted quadrature of the circle, though the name of Scaliger is not mentioned in it. This eminent scholar was exceedingly angry, and attacked Vieta with much bitterness. But he afterwards, according to De Thou, admitted his error, and did justice to his opponent. Vieta himself had a high respect for Scaliger, as might be inferred from his suppression of the name. If Isaac Casaubon is to be trusted, he thought most highly even of the mathematical knowledge of Scaliger. In one of Casaubon's letters to De Thou (p. 507 of the collection), he says, that on one occasion he and a friend paid a visit to Vieta, and that, Scaliger's name coming up in conversation, Vieta said, "I have so great an admiration of that astounding genius, that I should think his alone perfectly understands all mathematical writers, particularly those of the Greeks." And he added, that he thought more highly of Scaliger when wrong than of many others when right.

Relatio Calendarii veri Gregoriani (Paris, 1600); *Kalendarium Gregorianum perpetuum*, and *Aduersus Christophorum Clavium Expostulatio* (Paris, 1602). We have said enough of these unfortunate works in the preceding part of this article. The expostulation is preceded by Greek verses addressed to Clavius.

All the preceding works are contained, in the order in which we have mentioned them, in the collected edition of Vieta's works, edited by Schooten, and printed by the Elzevirs at Leyden in 1646. It seems that Vieta's papers had either been almost entirely destroyed or else exhausted; for though the Elzevirs, in 1640, advertised their intention of printing such an edition (in the first number of the 'Catalogus Universalis,' an annual book-list, printed at Amsterdam), requesting those who had anything unpublished of Vieta's to communicate it, and giving the names (without dates, unfortunately) of all that had been published, yet they could not print, six years after this advertisement, one single treatise which did not appear in their own advertisement as already known. We have yet to speak of two other works, both remarkable in their way, which are not in Schooten's collection.

Harmonicon Cœleste.—This work he only been recovered in our own day. Schooten's reason for not giving it was, that he could only find an incomplete and inaccurate copy to print from; but he says that he had reason to suppose he should obtain a more complete copy, which he promised to publish with other writings of Vieta: no such publication was produced. Very near before the publication of Schooten appeared, Bouilland, in the prolegomena to his 'Astronomia Philolaica' (1645), says that Peter Dupuis (Petrus Puteanus) had lent the manuscript to Mersenne, and that some borrower, or more professor, had (but which is not said) had obtained it from Mersenne, and had never returned it. Some particular person is evidently pointed at; Bouilland says this borrower would neither restore it nor a copy of it, and suspects that he meant to publish it as his own. Bouilland was a good authority in this matter: he was known to De Thou, Schooten, &c., and Peter Dupuis was one of his colleagues in the formation of the catalogue of De Thou's library, and perhaps, if the story be true, got the manuscript out of that library to lend it to Mersenne. This story has been repeated in many English writers on astronomy, from Shorbreare Cuthbert to Hutton, and always in the same words. Some inquiries which the writer of this article made some years ago at Paris through a most competent investigator, ended in the assurance that it was in *Bouilland's handwriting* in the Royal Library at Paris, that he (Bouilland) had himself lent the manuscript to Cosmo de' Medici of Tuscany, which must have been after it was recovered from Mersenne's honest friend, and of course after the publication of the 'Astronomia Philolaica.' Lately M. Libri ('Hist. des Sci. Math. en Italie,' vol. iv. p. 22) announces that there is an imperfect manuscript in the Royal Library at Paris, and that the original manuscript of Vieta (and an old copy, which however is mislaid) is in the Magliabecchian Library at Florence (which confirms the last statement of Bouilland). He gives a short account of the contents of the Paris manuscript, which contains various modifications of Ptolemy's theory, and sufficient proof that Vieta well knew both the writings of Copernicus and Tycho Brahé. Of the former he says that the excellence of his system, if any, is destroyed by the badness of the geometry by which it is explained; and M. Libri states that he avows his opposition to the heliocentric system still more plainly in other places. There is one conjecture which is worthy of some attention: we have seen how imperfect is the evidence for attributing to Apollonius the opinion afterwards maintained by Copernicus; Vieta asserts that this opinion was called Apollonian, not because Apollonius promulgated it, but because the sun (Apollo) is in the centre of the system.

It was said that the 'Harmonicon Cœleste' was to be published, but it has not yet appeared.

Canon Mathematicus, seu ad Triangula, cum adpendiciibus, Lutetiæ, apud Johannem Metayer, &c., 1579; to which is annexed, with a new

Digitized by Google

title-page, 'Francisci Vietæi universalium Inspectionum ad Canonem Mathematicum liber singularis, Lutetiæ,' &c., as before.

This same book, from the same types, is also found with another title-page, as follows:—'Francisci Vietæi opera mathematica, in quibus tractatur canon mathematicus, seu ad triangula: item Canonion, &c. &c. &c., Londini, apud Franciscum Bouvier,' 1589 (but though bearing the imprint London, it is evidently printed on the Continent).

The same book, again from the same types, is in the British Museum with a third title-page, as follows:—'Fran. Vietæi Libellorum Supplicum in Regis magistri, insignis quæ Mathematici, varia opera mathematica, in quibus tractatur Canon Mathematicus, seu ad triangula; item Canonion, &c., Parisiis, apud Bartholomæum Macæum,' &c., 1609.

That the second and third are really the same book as the first, with a new title-page, we have ascertained by carefully comparing various words which are misspelt, and letters and lines which are broken, in all three; also by the fact that the second title-page, 'Francisci Vietæi,' &c., is the same, date and all, in the second. In the third the second title-page is taken out, and Mettayer's address is printed after the first. This book may, from its extreme scarceness, a bibliographical curiosity: we have seen five copies, three with the first title-page, one with the second, and one with the third: in two of the first three, some figures which are not found in the third have been stamped in after printing; and the same stamping is apparent both in the fourth and fifth. The canon mathematicus is in five tables in which sines and cosines, tangents and cotangents, secants and cosecants, are completely given; they are arranged in the modern form, in which each number entered has a double appellation. But the notation of decimal fractions not being invented, the mode of description is as follows:—to give the sine and cosine of 24° 2′, Vieta states that, the hypothenuse being 100,000, the perpendicular and base are 40,727 and 91,330 9; and in a similar way for the others: and here it is remarkable that in the cosines Vieta does use a species of decimal notation, leaving a blank space instead of using a decimal point; for, to an hypothenuse 100,000, the base to an angle of 24° 2′ is what we should now write 91,330·9. There is also a large collection of rational-sided right-angled triangles, which form a trigonometrical canon, but not according to equal angles. The work concludes with a copious collection of trigonometrical formulæ and various numerical calculations, for mention of which see Hutton's 'History of Trigonometrical Tables,' prefixed to his logarithms, and inserted in his tracts. A short preface by Mettayer, prefixed to the 'Universalium Inspectionum,' &c., states that Vieta found great difficulties in getting tables printed for him, and also that plagiarists had printed and sold something of the kind, but what is not stated. Vieta himself (Schooten, p. 323) calls this book *infelicter editus*, and hopes that a second edition will be of better authority.

Having now given, we believe, as complete an account of Vieta as existing materials can furnish, in consideration of the very meagre manner in which his biography is usually treated (the article in the 'Biographie Universelle' is very poor, considering that the work is French, and Vieta the greatest French mathematician of the 16th century), we may speak briefly upon the merit of his writings. Vieta is a name to which it matters little that we have not dwelt on several points which would have made a character for a less person, such as his complication of the cases of solution of right-angled spherical triangles, his expressions for the approximate quadrature of the circle, his arithmetical extensions of the same approximation, and so on. The two great pedestals on which his fame rests, are his improvements in the form of algebra, which he first made to be a purely symbolical science, and showed to be capable of wide and easy applications in *ordinary hands*; his application of his new algebra to the extension of trigonometry, in which he first discovered the important relations of multiple angles; and his extension of the ancient rules for division and extraction of the square and cube roots to the *angelic powers*, for the solution of all equations, which, with Mr. Horner's new mode of conducting the calculation, is becoming daily of more importance. He did not, as some of the French say, lay down the view of equations which was afterwards done by Harriot; but he made great suggestions towards it, stronger suggestions than the Italian algebraists had furnished him with for his own new algebra: it is Harriot's praise that he saw how to go on from where Vieta had stopped, as it is that of Vieta to have proceeded from the point at which Cardan had stopped. Neither did he, as some of the French again say (but not from national feeling in this instance), first apply algebra to geometry; for if by the application of algebra be meant the method of co-ordinates, that application is wholly due to Des Cartes, assisted, no doubt, by the power which Vieta conferred on algebra. But if nothing more be meant than the solution of geometrical problems by help of algebraical symbols and methods, many have claims before Vieta; for instance, Regiomontanus, Cardan, and Bombelli. Nay, Vieta himself points out that Regiomontanus had solved problems algebraically which he complained of not being afterwards able to do geometrically; and Vieta himself supplies the geometrical verification of Regiomontanus's algebraical solutions. Neither did he, as some of the French again say, show how to form the coefficients of the powers of a binomial: he saw, no doubt, the connection of them with the series, 1, 2, 3, &c., 1, 3, 6, &c., 1, 4, 10, &c., as Tartaglia had done before him; but he did not show how to form them by any algebraical law, as Newton afterwards did. If a Persian or an Hindoo, instructed in the modern European algebra, were to ask, "Who, of all the individual men, made the step which most distinctly marks the separation of the science which you now return to us from that which we delivered to you by the hands of Mohammed Ben Musa?" the answer must be—Vieta.

The earliest history of algebra is that contained in the mixed treatise of Wallis (in English, 1685; in Latin, 1693). Wallis had a partiality for Harriot, which not only blinded him to much of the merit of Vieta, but furnished him with spectacles by which he could see most of the discoveries of the latter only in the writings of the former. Montucla has fairly and properly exposed this tendency; but that he may be disqualified to throw a stone at Wallis, he, in his turn, gravely and seriously declares that he cannot see the merit of the invention of *ea, eam, &c.*, to represent the powers of *a*, instead of Vieta's mode. Montucla is not altogether fair to the Italian algebraists who preceded Vieta, as to which he has been severely criticised by Cossali, and also by M. Libri. But these Italian historians have a corresponding fault: they make a painful endeavour to show that the peculiar discoveries of Vieta are to be found in the writings of their own illustrious countrymen, and particularly of Cardan. Cossali will even have it that Cardan has even something equivalent to, or very nearly approaching to, Des Cartes's theorem on the roots of equations; and constantly endeavours to show that Cardan might, could, would, or should, or ought to have had something which he just stops short of saying Cardan actually *had*. He wants to make his countrymen a school of constructive discoverers; if Cardan had only taken the contents of page *x* and added to it what he did, and seen something at page *y* which he did not see, then he would have been able at page *z* to do something which he did not do, but which Vieta *did* do. M. Libri starts more fairly: "In France," he observes (vol. iv., p. 1), "Vieta made algebra approach nearer to perfection, and, perhaps, caused the labours of his predecessors to fall into too much neglect." This is perfectly true, and might have been more positively expressed; but a little further on we find (p. 7), "In truth his discoveries seem to be not comparable to those of Ferro or Ferrari." This is truly strange; for in the next sentence we find he "was an eminently philosophical mind, and is more to be admired for his methods than for the results which he obtained from them." Can it seriously be M. Libri's opinion that the inventor of an isolated result is to be placed above one who increases the power of the human race over every branch of science? As it is not, we have to state, for the greatness of a discovery, that it is a method, not a result, and that the power which it gives to others makes succeeding results obtained from it more remarkable than those of the inventor himself if ever it has been true that coming events have labours their shadow before, it has been in the progress of the mathematics: it never has happened, in the case of any great discovery, that it was made upon quite a clear field. No one can read the history of science without finding that there was always, in the time immediately preceding the promulgation of any new method, a constant tendency towards the invention of that method, a series of efforts the results of which have speedily merged in those of the man for whom the discovery was reserved. This leaves the relative merit of investigators unaltered; if it deprives Vieta, it also deprives Cardan, Tartaglia and Cardan. Cossali has traced all three; for it points out that they have severally succeeded where their predecessors have failed, and relieves them from the consequences of the supposition that it was merely their good fortune which led their thoughts to that which another might as easily have attained if his thoughts had been turned towards the subject. If sometimes too much Gallicism shows itself, by way of exception, in the admirable history of Montucla, it is not half so offensive as the constant and always recurring nationality of the Italian historians, which renders it necessary to watch them so closely, that at the end of it will be a general conviction that they are not to be safely read at all, without the original authorities at hand, on any matter in which claims of country can enter. M. Libri, in finding out, and with perfect correctness, that Cataldi used continued fractions before Bromnker, and infinite series (or at least an infinite series) before Wallis, and in making a very just remark on the interest with which the first dawnings of the doctrine of infinites should be regarded, forgets that Vieta had preceded Cataldi, to the extent of using a combination of the infinite product and series united. It would be difficult, we think, to produce an earlier germ of the doctrine just alluded to than is seen in the celebrated expression given by Vieta for the quadrature of a circle, which we should now express thus

$$\frac{2}{\pi} = \sqrt{a} \cdot \sqrt{(a+\sqrt{a})} \cdot \sqrt{\{a+\sqrt{(a+\sqrt{a})}\}} \text{ &c.}$$

where a means half a unit. ('Resp. Math.,' Schooten, p. 400.)

Both Vieta and Cossali endeavour to show that the Italian algebraists used letters for quantities, both known and unknown. So they did, no doubt, and so did Euclid, and so (secondarily, at least himself) did Aristotle. But who combined the use of letters with that of symbols of operation so as to produce algebraical formulæ, and to give to the operations of algebra that technical character which makes them resemble the operations of arithmetic? One look at any page of the Italian algebraists will show the difference between their algebra

Digitized by Google

and that of Vieta better than any description. Accordingly, both Cossali and Libri state the asserted resemblance without specific citation. When will the writer who asserts that Cardan was substantially in possession of Vieta's algebra, attempt to substantiate his assertion by putting so much as half a page of the former side by side with one of the latter?

VIGA GANITA, the name of the principal Hindoo work on Algebra which remains. In our notice of DIOPHANTUS, the Alexandrian mathematician, we referred to the head Viga Ganita the consideration of the question whether the method of analysis which bears his name, but of which it is impossible to suppose he was the inventor, was borrowed from certain Greek predecessors, or whether he derived the original suggestion from India. We have also referred to this article all matters which relate to the astronomical and arithmetical science of the Hindoos, because there is not enough to be said on the subject or the writers, to make it worth while to distribute what we have to say under heads in a work like the present. We cannot pretend to the knowledge of Oriental matters which is necessary to form the most positive judgment upon the controversy; but it is of more consequence to our readers to see the manner in which the question has been discussed, than to be put in possession of any new statements of opinion; and it is of some importance that those who may hereafter write on the subject, should see that a disposition to support system is soon pointed out, even in ordinary works of reference.

In 1687 La Loubère, returning from his embassy to Siam, brought home what are called the Siamese Tables. In 1750 Du Chemp, a missionary, sent home another set of tables, from Christnaboureum (the Christnabaram of the missionary maps) in the Carnatic. About the same time Petouillet, another missionary, sent home another set, nameless, but supposed to answer to the latitude of Neraspur, near Masulipatam. In 1769 the astronomer Le Gentil brought with him from India, where he had been to observe the transit of Venus, the tables of Tirvalore. These were all the documents of Indian astronomy which were known when Bailly published his history of that subject. The professed epochs of these tables are—Siamese, A.D. 638; Christnabouram, A.D. 1491; Naraspur, A.D. 1569; Tirvalore, B.C. 3102, the beginning of the Cali Yug, or fourth great age of the Hindoos.

These tables, with the exception of some remarks by D. Cassini and Le Gentil, excited no great notice till they impressed the active imagination of Bailly with the idea that the epoch of the Tirvalore Tables was that at which they were made, and that consequently they represent actual observation made nearly five thousand years ago. We have seen, in the article cited, the manner in which he rode this singular hobby, and how he even changed it at last for one still more strange, in inventing a people unknown to history to be the original propositors of all astronomical science. Bailly had learned from his Indian teachers not to be nice about a few thousand years; but, as it has been mercifully said that we are not to judge of the temptation to which a man has yielded, without taking into consideration the amount which he may possibly have resisted, we may remember that the Hindoo Calpa was upwards of four hundred millions of years, and that Bailly, when at his wildest, never asked for more than eight or nine thousand. His latest opponent, Bentley, who, as we shall see, had the same sort of fault as himself, petitioned for and obtained a sort of certificate in his own favour from Macaulay, who states that, to his knowledge, Lalande and Laplace considered Bailly as a superficial astronomer and an indifferent calculator. But Bailly was a better calculator than Laplace, and a better astronomer (in the sense in which Laplace was an astronomer) than Lalande.

The antiquity of Hindoo astronomy found favour in the eyes of Playfair, and was supported by him in the 'Edinburgh Transactions,' in a paper which is reprinted in his miscellaneous works. It was opposed by Leslie, who regarded everything Indian with abhorrence: he grew ignorance and rude assertions were exposed by Colebrooke ('Algebra,' &c. Introduction, p. 59). Playfair's only authority was Bailly; and his paper amounts to little more than a reiteration, in his own elegant manner, of the main points of Bailly's argument. Sir W. Jones evidently leans to the side of Colebrooke, in placing the foundation of the Indian system about B.C. 2000, seems to suppose that astronomical knowledge was nearly of as old a date; but he does not enter into the question as a mathematician. We next come to Delambre, a mind the opposite of Bailly's in every particular: he was seduced by the regular and demonstrated systems of the Greeks into the belief that the origin of all astronomy which deserves the name must have been Grecian. Relying upon nothing but contemporary written documents, his mode of meeting every conjecture, however probable, is simply that of meeting it as conjecture. It is evident that the spirit of system is as strong in him as in Bailly, the current only setting in a different direction; his mode of arguing equally keeps out truth and falsehood, when it comes on unwritten evidence. The admissions which he is obliged to make in favour of Indian arithmetic and algebra, are evidently wrung from a most unwilling soul; and not content with overthrowing most completely the premises of Bailly's argument, he endeavours to insinuate that all the astronomy of the Eastern world either did come or might have come from the Greeks: in his mind the latter is the same thing as the former. Much of the matter of Delambre's chapters on the subject is drawn from the writings of Davis and the earlier writings of Bentley. Colebrooke's 'Algebra,' &c. only appeared in time for him to consider it in the preface to the History of Astronomy in the Middle Ages. He did not see Colebrooke's work: the account of it in the 'Edinburgh Review' was, he says, better for his object (and he puts it in italics) than the work itself, on account of the accompanying remarks. It is the only instance that we can find in which an article in a review serves Delambre's purpose better than the historical documents on which it was written.

Since the time of Bailly, three Anglo-Indians have written on the subject of Hindoo science, more or less controversially: Samuel Davis, Henry Thomas Colebrooke, and John Bentley. The first two are the only writers in our list who seem to have no personal wish that the astronomy of which they treat should have any particular date. Mr. Colebrooke states that Mr. Davis was the first who opened to the public a correct view of the astronomical computations of the Hindoos. Mr. Colebrooke was one of the most eminent of Sanskrit scholars, an indefatigable Indian antiquary, and more than well informed in mathematics and astronomy. His account of the Hindoo systems of philosophy, as published in his 'Miscellaneous Essays,' is by far the best which exists; and all that he has written on their science is done in the most careful and conscientious spirit. We may even say that it was his bias to allow the least possible weight to his own arguments, and the greatest to all that could make for his opponents. For instance, when he has brought the time of Aryabhatta (presently mentioned) to "some ages before the 6th century," he places him in the 5th century A.C., and requires no other conclusion to be granted. But when he comes to speak of Diophantus (of whom, the earlier he wrote, the more likely is it that he did not borrow his algebra from India), he is willing that it should be "confidently affirmed" that he cannot be later than the 4th century, because (such are his grounds) Suidas states that Hypatia wrote a commentary on some Diophantus, most likely the writer now known by that name, and an author of uncertain date in the 'Anthologia' wrote an epigram upon him. Throughout his writings there is this apparent carelessness of making the most of his own argument, and the least of that of his opponents, to an extent which, while it makes us feel we are certainly on the safe side in following him, causes us to regret that no cautious an investigator should not have given us his limits in both directions. We consider him by far the safest guide, both in point of learning and judgment, taking the former from the general report of Oriental scholars; and accordingly we shall represent him as to dates and facts, even where we do not follow him.

Mr. Bentley, the last named of the three, is the Bailly of those who oppose the antiquity of Hindoo astronomy. In his earlier writings, which are to be found (as well as those of Davis and some of those of Colebrooke) in the 'Asiatic Researches,' he does not deserve any such epithet; his opinions, though strong, are accompanied by their supports moderately stated. His paper 'On the Antiquity of the Surya Siddhanta' was published in 1799: it was not till 1823 that he published in Calcutta his 'Historical View of the Hindoo Astronomy,' which was reprinted in England in 1825. It is in this work that he has surpassed Bailly in his own line. The Hindoo works are forgeries by the doz-n: Bentley knows who forged them, and why. The upholders of Indian antiquity are dupes, or worse; they are to take the part given by his preface of supporting all the horrid shocks and impositions of the Hindoo superstition, "the burning of widows, the destroying of infants, and even" (even!) "the immolation of men." They conspire to overturn the Mosaic account; and they calumniate the just endeavours of those who wish to stop the career of imposition. It is worth while to state an instance or two of Mr. Bentley's mode of proceeding, as some of our readers may have no other authority on the subject.

Bhascara, the author of the Lilliwati and Viga Ganita, lived, according to Mr. Colebrooke, who gives his reasons, in the 12th century. A version of the former, by one Faizi, was made, at the command of the emperor Akber, in 1587. It does not please Mr. Bentley that it should be so, and he accordingly informs us that Bhascara's work was presented to Akber, by the author being "alive;" but that, in order to give a false antiquity to the work, it was represented as that of another Bhascara, who lived some centuries before. Not a single hint at any authority is given; it is a simple statement, as of the author's own knowledge; and is only one out of hundreds of the same kind, all of which Mr. Bentley calls in different places "absolute facts," "demonstrated facts," &c.

Again, Mr. Colebrooke mentions a treatise which he found in his library, the Siddhanta-Sphuta. This is one of Mr. Bentley's mass of forgeries: nevertheless; but in this instance he declares he has the forger. A native, he says, offered his services to him, informed him that his profession was 'book-making,' in rather an odd sense, for he said he could forge any book whatever. This native was, after being contemptuously dismissed by Mr. Bentley, in the employment of Mr. Colebrooke, at least so the former affirms; and on this native he fixes the forgery, as he asserts it to be, of the Siddhanta-Sphuta, giving us to understand that the keen and critical eye of Mr. Colebrooke could be deceived by so shallow an artifice as a recent forgery laid among his papers by his own servant. And he makes this adroit native interpolate other books of Mr. Colebrooke's, so that the latter, in fact, had

Digitized by Google

a manufactory of falsified history on his own premises, from which his opponent could destroy the genuineness of any passage he pleased. Mr. Bentley does not tell us in what language he talked with this native, but we strongly suspect that they misunderstood each other.

On the grounds of the complete absence of all reference to authority, the certainty of all the conclusions (for there is rarely an admission of any degree of probability less than certainty), and the temper of the writer, who sees nothing but folly or fraud in every one who differs from him, we should feel justified in assuming that Bentley is no authority whatsoever in the matter. But Colebrooke answered Mr. Bentley's work, in the 'Asiatic Journal' for March 1826; and though the answer does not occupy more than seven pages of the periodical above cited, it sets in array such a number of inconsistencies, as well as of simple unsupported assertions, as to satisfy us that our opinion of Bentley as derived from his writings was a correct one. With respect to the asserted forgery of the 'Brahma Sphuta Siddhanta,' Colebrooke says it is "an idle guess, untrue in all its particulars." But he turns the tables on his opponent, as follows:—"Bentley has reasoned on a treatise in his possession, which he calls the Arya Siddhanta, and asserts to have been written by Aryabhatta." Colebrooke says that none but Bentley had seen this work, that the manuscript was not forthcoming, that Bentley himself did not understand Sanskrit, that the natives about him well knew its notions, and that he was as likely as his friend Colonel Wilford (who from his ignorance of Sanskrit had had some very curious impostures palmed upon him) to have been imposed upon. With regard to his own manuscript Colebrooke adverts to the fact of its being (with the rest of his Oriental library) deposited at the India House, in a position accessible to Sanskrit scholars. And with respect to Bentley's celebrated test, namely, that tables must have been constructed at the time when they best represent the state of the heavens, Colebrooke adverts to an instance in which Bentley himself was obliged to abandon it, because it would have proved that a certain set of tables, which now exist, were written fourteen hundred years *hence*. But as we have nothing here to do with Bentley, except to give sufficient reason for not taking as an authority a writer whose name is very well known (perhaps better than that of any recent Sanskrit commentator with the subject), we refer the reader to the 'Asiatic Journal' (March, 1826, vol. xxi.) for further information.

The writers who are most cited by Hindoo astronomers bear the names of Varaha-mihira and Brahmegupta. The astronomers at Ujein place BRAHMEGUPTA at A.D. 628, and Mr. Colebrooke, from his own description of the position of certain stars with respect to the equinox, thinks he lived towards the end of the 6th century. His work, called the Brahma Sphuta Siddhanta, generally referred to under the name of Brahma Siddhanta, which appears to be a correction of a treatise of the latter name, was found in an imperfect state by Mr. Colebrooke. He informs us that it consists in the computation of mean motions and true places of the planets; solution of problems concerning time, the points of the horizon, and the position of places; calculation of lunar and solar eclipses; rising and setting of the planets; position of the moon's cusps; observation of altitudes by the gnomon; conjunctions of planets with each other and with stars; the astronomical sphere and its circles; the construction of sines; the rectification of the apparent place of the moon; mean motions; the syzygies; lunar and solar eclipses; and the construction of the armillary sphere. It also contains algebra and mensuration.

From his astronomical data Colebrooke infers that VARAHAMIHIRA wrote at the end of the 5th century, which is also the date assigned to him by the astronomers at Ujein. He is the author of a system of astrology (including astronomy), which he declares he has compiled from earlier writers. These is another Vahara-mihira, whom the same astronomers place in A.D. 900. But popular tradition places Varaha-mihira in the time of Vikramaditya (B.C. 56), and names, as hereafter noticed, several of his contemporaries. No historical evidence tending to impeach this tradition has yet been put forward, not prominently at least.

ARYABHATTA, known to the Arabs under the name of Arjabahar, is placed by Colebrooke, after much discussion, at not later than the 5th century, possibly not far from the first. He wrote both on astronomy and algebra, but none of his writings have been found, except in citations.

Authors prior to or contemporary with the last named are mentioned by name, and even cited; such are Paliśa, Parasara, and others; but none of their writings are preserved.

BHASCARA ACHARYA, the author of the Lilliwati, Viga Ganita, Siddhanta-siromani (of which the two former are parts), and other works, is very confidently placed by Colebrooke A.D. 1150.

The celebrated work on astronomy, the Surya-siddhanta, is of uncertain date. The term siddhanta means a system of astronomy, and surya is the sun. The oldest writings mention a work of this name, and the Arabs state that among the systems of astronomy of the Hindoos there is one called Arca (or solar). The tables mentioned at the beginning of this article are generally admitted to have been substantially taken from the Surya-siddhanta, as it now exists, or from a common source; but whether the work which now exists is that which was mentioned by the ancient writers may be strongly doubted. Bentley (in one of his early papers, before he became his reader's sole authority) has discussed the question; and assuming that the age of a table is most probably that at which, one result with another, it best represents the heavens, has deduced the year A.D. 1000, or thereabouts, for the age of the Surya-siddhanta. The principle is a fair one; and Colebrooke at one time acknowledged great force in Bentley's argument. But it is notorious that the Hindoo writers were in the habit of correcting their works from time to time, without altering their names; so that it is very possible that there may always have been a Surya-siddhanta, from the earliest times of Hindoo astronomy. The name of the author, according to Bentley, is Varaha-mihira; but Colebrooke does not mention any author, as far as we can find, and certainly disputes Bentley's assertion, which also overturns itself, thus:—Bentley's method (which was also that of Bailly and Playfair, though their conclusions differed), as applied by himself, throws the tables of Brahmegupta into the 6th century: now Brahmegupta mentions Varaha, who is nevertheless, by Bentley's own conclusion from another source, the author of the Surya-siddhanta in the 11th century. Perhaps it was this dilemma which drove its author to assert forgery upon forgery, until he had set all right.

It thus appears that there is ordinarily good evidence for a succession of writers from the commencement of the Christian era up to the 12th century, with no very great allowance of antiquity to those who are cited by the earliest writers now remaining. There would be nothing extraordinary in the supposition that the chain of authors went back to the time of Alexander at least, since it is certain that the Brahminical system existed before the time of that conqueror. The only question which is worth discussing is, whether anything was received from the Greeks, and if so, whether it was without interchange, and enough to give us a right to say that the Greeks were the primary instructors of the Hindoos. If not, then it is to be settled whether the Hindoos were the original instructors of the Greeks. It is only with reference to this question that the antiquity of Hindoo astronomy is of much independent interest, as a matter of discussion at least: if the astronomy travelled westward, then we must place a flourishing period of it before the time of Thales, and the only thing to be said is, that we must push back to wait for the actual ascertainment of the most active age of Hindoo science, till we know that of other things. But if it travelled eastward, it must be pretty clear, from the dates given above, that it was the science of Hipparchus and his successors of the period preceding Ptolemy, and not that of Ptolemy, nor of his Saracen followers, which was communicated to the Hindoos.

There is some evidence of communication between the Greeks and Hindoos, such as it is; but neither Deiambre nor Bentley could produce it. All that can be obtained from the actual theories and methods amounts to very little indeed, in establishing any connexion, while there are hints and processes by the dozen to which there is no resemblance whatever in the Greek writings. Varaha-mihira, according to Colebrooke, says that the Yavanas (Ionians or Greeks) are barbarians, and that the Hindoo science (astronomy) was established among them, and they (the learned in it, we suppose) are revered like holy sages. The name of Yavana-charya, which occurs frequently in Hindoo compilations, is thought by the same writer to have reference to some European; and he thinks he sees in a work entitled Romaca Siddhanta a title which has some allusion to the name romaca. Colebrooke says, nevertheless in another place Colebrooke cites one *Yavaneswara* as a known Sanskrit writer. Besides this, there are several words of Greek origin, and used in their Greek meaning. First *hora*, for astrological prediction, in the sense of determining the *hour*.—"Varaha mihira, ... derives the word from *ahoratra*, day and night.... But this formation of a word, by dropping *both* the first and last syllables, is not conformable to the analogies of Sanskrit etymology." Next *drecchcana*, used in the same astrological sense with the Greek *δεκανος* and Latin *decanus*. Thirdly, for the minute of a degree, the Hindoos have adopted, besides their own *cala*, one taken from the Greek λεπτα, hardly altered in the Sanskrit *lipta*. This word in Sanskrit means smeared, infected with poison, eaten; and the dictionaries give no interpretation that has any affinity with its special application as a technical term in the writings of Brahmegupta. *Cendra*, for centre, resembling the Greek *κεντρον*, is not easily traced to any Sanskrit root. If to all that precedes we add that the Hindoo astronomy employs epicycles about as much as Hipparchus appears to have done, but stops decidedly short of the use of them made by Ptolemy, it seems very likely, especially when we consider the age in which their earliest cited writers must be placed, that they had some communication with the Greeks, or their writings, before or immediately after the Christian era. And this surmise, founded on the points of resemblance between their astronomy and that of the Greeks, receives an additional probability from the state of their political affairs. In the first century before our era was the celebrated prince Vikramaditya of Ujein, from whose reign the years of the Samvat era are counted (B.C. 56). Vahara-mihira, whom Colebrooke leaves somewhere in the 5th century, is the name, according to Professor Wilson, of one of nine who were called the gems of the court of this prince. The prince just mentioned was a noted promoter of knowledge, and the period was a remarkable one. It is not unreasonable to suppose that at this period, which is intermediate between the times of Hipparchus and Ptolemy an effort was made to obtain information from Greek

Digitized by Google

writings: nor would it be unlikely that at the same time those notions of algebra from which Diophantus wrote his work were given in exchange. It is exceedingly difficult to make any other conjecture which will explain the existence of this solitary work on algebra among the Greeks; but that the Hindoos received at this time *all* their astronomy is very unlikely. In several points it differs materially from the system of the Greeks, and in some it is more correct: for instance, in the precession of the equinoxes, the length of the tropical year, and the synodic period of the moon.

It is worth noting that the disposition which existed among Greek writers to send their old sages to India to learn the principles of astronomy and other sciences does not commence till after the Christian era.

We may now leave the question of the antiquity of Hindoo science, and proceed to give some account of its materials. The works in which it is contained are usually written in verse, and in short and obscure precepts, intended to be committed to memory: the commentators take every verse, and almost every word, in succession. The most peculiar feature of these books is the general absence of demonstration: results only are frequently announced. It cannot be denied that there is, particularly in the algebraical part, a frequent succession of steps, of which the connection is pointed out in a manner which makes the last of those steps a necessary consequence of the first. But though a Hindoo writer may fall into the road of demonstration in any part of his journey, and remain there for a time, it is evident that this is with him entirely a matter of convenience, and that he does not feel himself at all bound to give proof.

It seems to us by no means to be taken for granted that there ever was any such thing among those writers, or their predecessors, as a connected system of demonstration; there are few propositions either of their geometry or algebra which might not have been found by trial, and verified numerically or graphically; or else procured from empirical propositions by the mode of occasional demonstration just alluded to. But it must be allowed that here and there we have a proposition for which it is difficult to suppose an origin without preanning, not only power of demonstration, but methods of considerable generality. Though the Greeks, after the time of Euclid, never published anything of a mathematical nature without demonstration, it does not follow that even they had demonstration from the beginning; and the hints given by Proclus on the progress of geometry would almost support the contrary notion. The idea of an undemonstrated mathematical system may appear a strange one, but it must be remembered that the nations of modern Europe, in this matter, were the pupils of the Greeks, and never, till of late years, even so much as heard of any science which was independent of their own masters, except what has been added among themselves; and it is no wonder that any different mode of proceeding may seem strange, when the mere possibility of such a mode has never been made a matter of discussion among us.

The following is Colebrooke's comparison of the daily motions of the several planets, according to the Hindoos, Ptolemy, and Lalande (it is not worth while to substitute any astronomer more modern than the latter). Degrees, minutes, and seconds are common to all:—

	Brahmegupta.			Surya Siddhanta.		Ptolemy.		Lalande.	
	°	′	″	″′	ⅳ	″′	ⅳ	″′	ⅳ
Sun	0	59	8	10	22	10	17	19	48
Moon	13	10	34	52	47	52	3	58	20
Moon (synodic)	12	11	26	42	25	41	53	41	52
Mercury	4	5	32	18	28	20	42	24	12
Venus	1	36	7	44	35	43	39	43	6
Mars	0	31	26	28	7	28	11	29	53
Jupiter	0	4	59	9	9	8	48	14	26
Saturn	0	2	0	22	52	22	53	33	31

It appears then, that Ptolemy's daily motions are generally too small, but that the Hindoos err still more in the same direction; except only in the synodic motion of the moon, in which they are much more correct than Ptolemy: the Surya Siddhanta in particular, probably the later work of the two, and therefore the one which is to be misled by Ptolemy's numbers if they were known, agrees entirely with Lalande. This is what might have been expected: the Hindoos were not, as far as appears, noted for good observations, nor very apt to record them; but they sedulously studied to reconcile, the prediction of which was the most important duty of the astronomer, and hence the goodness of their determination of the moon's *synodic* motion.

The length of the sidereal year is given 365ᵈ 6ʰ 12ᵐ 30ˢ, more than three minutes too much; the Hindoo astronomical year is sidereal, and begins when the sun enters the sign of the Ram. But their tropical year is 365ᵈ 6ʰ 50ᵐ, much nearer the truth than that of Ptolemy and Hipparchus, which was 365ᵈ 6ʰ 55ᵐ. The meridian from which they reckon is that of Lanka, which some take to be Ceylon, others the name of a lake near the sources of the Ganges; it passes through Ujein. Their precession of the equinoxes is 54″ in each year, which is much more correct than that of Hipparchus or of Ptolemy. Most of the Hindoo writers do not suppose a permanent precession, but imagine the oscillatory motion or trepidation, as it was called when it was afterwards introduced into Europe by the Arabs, who seem to have borrowed this idea from India. Those who hold the oscillatory motion fix it at from 24″ to 27″ on each side of a mean position. The revolutions of the apsides and nodes of the moon are given within a fraction of a day of what they are now known to be; the obliquity of the ecliptic is 24°, too large even for their time. The inclination of the moon's orbit is made 4° 30′; those of Mercury, Venus, and Saturn, 2° each; of Mars, 1° 30′; of Jupiter, 1°. The circumferences of the orbits (obtained, it is said, upon the purely speculative idea that they all move with the same actual velocity) are given in 31 *yojanas*, a measure which appears to be used in different senses, and which cannot be very well settled. This *yojana* contains four *crosas*, and the modern crosa is 1·9 statute miles. According to Colebrooke, Aryabhatta gave 3300 yojanas for the circumference of the earth, which, if the crosa were the modern one, would be 25,080 statute miles, or 69·7 miles to a degree: this degree of accuracy must be accidental. With regard to the motions of the nodes and apsides of the planets, which the Hindoo writers profess to give, Colebrooke thinks they are inventions constructed from analogy with those of the moon. As to the more theoretical parts of astronomy, the Hindoos knew the inequality of the planetary motions which is called the equations of the centre, though their values of these equations are not very correct. They had about as much of that which was afterwards called the Ptolemaic system as is reported to have been invented by Hipparchus; the principal variation being that their epicycles are made (by several of their astronomers) oval, instead of circular. This is enough of the actual details of the astronomy for our present purpose; those who would know more of it must undertake the tedious and disjointed perusal of the volumes we have cited. No one of them would trouble himself to collect into one page the actual numerical elements of the astronomy on which they were all writing; and it is consequently so difficult to understand their several accounts (since, in case of apparent contradiction, we cannot know whether they speak of the same or of different values of the elements), that we have not felt ourselves able to supply the deficiency. It is not however of much consequence, for the elements of the Hindoo astronomy are only interesting as connected with its history and the discussions upon it. We have not at all entered upon the refutations which it is still customary to give to Bailly on points connected with the theory of gravitation. That writer imagined that by correcting the various elements of the planets, as they now are, so as to reduce them to what, according to the Newtonian theory, they ought to have been at the beginning of the Kali Yuga, remarkable agreement was found between the results and the recorded elements of Hindoo astronomy. There *is* such agreement in one or two cases, but the result of the whole is, that there is no reason to suppose the few accordances to be due to anything but accident.

The mixture of the mythological, which some of the Hindoo astronomers [the author of the Surya Siddhanta and also Bhascara; the latter, with apparent reluctance, not in the text, and only briefly in the notes] allow to appear in their works, and which seems to have belonged to the vulgar creed, presents a very strange appearance. Both in Hindoo and Burman systems eclipses are caused by a distinct planet, Rahu, of a dark essence, which at times takes both the sun and moon under its influence. The irregularities of the planetary motions, their stations, congruations, and departures from the ecliptic, are caused by deities provided for the purpose, who reside at the nodes and points of conjunction. Aryabhatta, according to Colebrooke, not only gave the true solution of the phenomena of eclipses, but asserted the diurnal motion of the earth, which he affirmed to be carried round an asta by a strong wind. Brahmegupta attributes this opinion to him with reproach, and asks why, in such case, lofty bodies do not fall (that is, off the earth). A commentator of Brahmegupta, who lived before the 12th century (since he is mentioned by Bhascara), and whose name (Pradoom Swami) deserve to be mentioned, in spite of our wish to keep as clear of these unretainable appellatives as we can, says—"The objection that lofty things would fall is contradicted; for every way the under part of the earth is also the upper, since wherever the spectator stands on the earth's surface, even that point is the uppermost point." But the same commentator exhibits a very scholastic reason for the earth's motion causing the diurnal changes. He says a planet cannot have two motions; meaning that the orbital motion is the only one it can have, and that the diurnal motion is therefore to be attributed to the earth.

The great point of contest seems to have been whether the earth is stable in space or perpetually falling; if the former, whether it stands by itself or upon a support. We do not find that any astronomers acted from authorities support the notion which our books attribute to the Hindoos, namely, that the earth stands upon an elephant, which itself stands upon a tortoise, which tortoise swims in a sea of milk; but there is an allusion to this succession of supports in a passage of Bhascara cited by Colebrooke, which is on other accounts worth the quoting. The Jains, a species of Buddhist sect, affirmed the falling motion of the earth; on which Bhascara remarks—"The earth stands firm, by its own power, without other support, in space. If there be a material support to the earth, and another upholder of that, and again another of this, and so on, there is no limit. If finally self-support must be assumed, why not assume it in the first instance?

Digitized by Google

Why not recognise it in this multiform earth? As heat is in the sun and fire, coldness in the moon, fluidity in water, hardness in iron; so mobility is in air, and immobility in the earth, by nature. How wonderful are the implanted faculties! The earth possessing an attractive force" (like the attraction of the loadstone for iron, adds a commentator), "draws towards itself any heavy substance situated in the surrounding atmosphere, and that substance appears as if it fell. But whither can the earth fall in ethereal space, which is equal and alike on every side? Observing the revolution of the stars, the Bandbhas (Jains) acknowledge that the earth has no support, but as nothing heavy is seen to remain in the atmosphere, they thence conclude that it falls in ethereal space. Whence dost thou deduce, O Bandbha, this idle notion?" &c. He adds in his notes, "For if the earth were falling, an arrow shot into the air would not return to it, since both would descend. Nor can it be said that it moves slower and is overtaken by the arrow, for heaviest bodies fall quickest, and the earth is heaviest."

As to the observations and instruments, it is sufficiently evident from the difference between the Hindoo system and that of the Greeks, that they must have had both. Their system is more accurate than that of Hipparchus or Ptolemy, precisely in the three fundamental results of widely separated observations—the tropical year, the synodic month, and the precession of the equinoxes. But no observations have been preserved, except indirectly in results; Bhaskara describes nine instruments, including the quadrant, semicircle, circle, armillary sphere, horary rug, gnomon, and clepsydra.

The periods of the Hindoos, which were of interest as long as it was a question whether the beginning of the Cali Yug was or was not to be considered as an epoch of actual observation, may now be transferred into the hands of the mythologists, warranted as long as ever. A Yug, or age, is 432,000 years; a Maha-Yug, ten Yugs, or 4,320,000 years; a Calpa, or day of Brahma, is 1000 Maha-Yugs, or 4,320 millions of years; and Brahma's life is 100 years of such days and nights, of which about one-half is past. Various attempts have been made to expound these periods by combinations of astronomical cycles; and considering that the number of years in a Calpa has 382 distinct divisors, it is not wonderful that various modes of putting astronomical periods together should be equally effective in this respect. It is just as well to leave these speculations, and to remark what a power of expressing large numbers was given by the Indian numeration, now universally diffused. Archimedes wrote a book (the 'Arenarius') merely to prove that it was possible to express such numbers as the Brahmins played with in their astronomical computations, and spoke of to the people in the common mythological stories.

The astronomy of the Hindoos would have had little interest, but for their arithmetic and algebra. In leaving the former to turn to the two latter, we shall soon cease to be surprise at the respect with which the astronomy has been treated, coupled as it is with an arithmetic which is greatly superior to any which the Greeks had, and an algebra which no other nation ever had, except those who derived it from the Hindoos. For even supposing Diophantus to have been an original inventor, which we greatly doubt, his work is hardly algebraical, in any sense in which that term can be applied to the science of India.

We shall begin by describing the *Lilavati* and *Viga Ganita*, the proper subject of this article, premising the reader to be aware that the Indian arithmetic is that which we now use, and that both this arithmetic and algebra were introduced among the Arabs from India (as the Mohammedan writers themselves inform us), through whom they were transmitted to Europe. [VIETA.] Bhascara Acharya (A.D. 1150, as already mentioned) was the author of the Lilivati (called after his daughter), and the Viga Ganita (or casual calculus: *viga*, cause; *ganita*, computation). These two works form the preliminary chapters of the *Siddantasiromani*, an astronomical work of the same writer.

The Lilivati opens with a salutation to Ganesa, the god of wisdom, and then proceeds to describe the system of weights and measures. Then follows decimal numeration, briefly described; and the *eight* operations of arithmetic, addition, subtraction, multiplication, division, square, cube, square-root, cube-root. Reduction of fractions to a common denominator, fractions, mixed numbers, and compound rules applied to fractions. Cipher; $* \; a \pm 0 = a$; $0^2 = 0$, $\; / \; 0 = 0$, &c., $a \div 0$, the submultiple of 0, called infinite by the commentator; $a \times 0 = 0$. Inversion of processes, the solution of such an equation as $\frac{1}{2}(x \div a) + b\} \; c - d = e$, which is made a rule of arithmetic. Rule of false position. Rule of concurrence, to solve $x + y = a$, $x - y = b$, and $x \pm y = a$, $x^2 - y^2 = b$. A problem concerning squares, finding pairs of fractions the sum and difference of whose squares, diminished by 1, are both squares. Solution of $x^2 \pm ax = b$. Rule of three. Compound rule of three, various cases. Interest, discount, partnership. Time of filling a cistern by several fountains (a practical matter to those who used the clepsydra). Barter. Presents of gems. Alligation. Arithmetical progression; sums of squares and cubes. Geometrical progression. Right-angled triangles; given two sides to find the third; also to find sides in rational numbers, to a given side or hypothenuse: segments of the base of a given triangle; perpendicular and area, the sides being given. Four-sided figures, areas, &c., sides and a diagonal or perpendicular being given. Many problems relative to four-sided figures. Circumference of a circle is diameter $\times 3927 \div 1250$, very nearly; but π 22 ÷ 7 is adapted to practice (the first answers to 3·1416): area is $\frac{1}{4}$ diameter × circumference: the surface of the sphere is four times that of the great circle: the solidity of the sphere is surface × diameter ÷ 6. Versed sine found from chord of twice the arc and diameter, and the two converse. "By 103923, 84853, 70534, 60000, 52055, 45922, 41031, multiply the diameter, and divide the products by 120000, the quotients are severally the sides of polygons, from the triangle to the enneagon, within the circle." To determine roughly the chord of an arc, a rule is used which amounts to the following:—

$$\text{sine of } \frac{2 \text{ right angles}}{n} = \frac{16\,(n-1)}{5n^2 - 4n + 4}$$

$$\text{or co-secant of } \frac{2 \text{ right angles}}{n} = \frac{1}{16}\left(5n + 1 + \frac{5}{n-1}\right)$$

For 1° this last gives 56·3 instead of 57·3, and the relative error diminishes up to 90°. A corresponding rule is given for the arc of a chord. The solid contents of a cone, pyramid, cylinder, prism, and truncated cone or cylinder, are then given, and rules for estimating the contents of mounds of different kinds of grain, derived from experiment, the height being greater or less according as the grain is coarser or finer. Various rules on shadows are then given, derived from the geometrical properties of a right-angled triangle, and this is followed by some rules on the pin and vertiser, presently noticed. The work ends with a chapter on combinations, containing questions of this kind: any number of digits being given, as 5, 5, 7, 8, 6, required the number of different arrangements, as 55786, 57865, 78565, &c., and a rule for the sum of all the numbers thus formed.

The Viga Ganita commences with a curiosity of the Sanskrit language—a sentence in which each of the leading words is threefold in meaning; so that it will bear, and is intended to bear, three different translations, which are as follows:—

1. I revere the unapparent computation, which sages conversant with theology declare to be productive of the intelligent principle, being directed to that production by the sentient being: for it is the sole element of all which is apparent.

2. I adore the ruling power, which sages conversant with the nature of soul pronounce to be the cause of knowledge, being so explained by a holy person: for it is the one element of all which is apparent.

3. I venerate that unapparent computation, which calculators affirm to be the means of comprehension, being expounded by a fit person: for it is the single element of all which is apparent.

Bhascara then proceeds thus: 'Science the arithmetic of apparent (known) quantity, which has been already propounded in a former treatise, is founded on that of unapparent (unknown) quantity, and since questions to be solved can hardly be understood by any, and not at all by such as have dull apprehensions, without the application of unapparent quantity: therefore I now propound the operations of analysis (Vija-crya, elemental solution.)'

According to Colebrooke, whose words we abridge, the algebraic notation of the Hindoos is as follows:—Abbreviations and initials for symbols; negative quantities with a dot; no mark for positive, except the absence of negative. No symbol for addition, multiplication, equality, greater or less. A product denoted by the first syllable of a word subjoined to the factors, between which a dot is sometimes placed. In fractions, divisors under dividend without line of separation. The two sides of an equation are one under the other, confusion being prevented by the recital of the steps in words which always accompanies the operation. Symbols of unknown quantity are various, usually initials of names of colours, except the first, which is the initial of *yavat-tavat*, 'as much as:' Bombelli used cossa in the same sense. Colour means unknown quantity, but its Sanskrit also signifies a letter, and letters are also used, either from the alphabet, or from initial syllables of subjects of the problem. Symbols are also used for variable and arbitrary quantities, and sometimes for both given and sought quantities. Initials of square and solid denote those powers, and combined, the higher powers, reckoned * not by sums of powers, but by their products. An initial syllable also marks a surd root. Polynomials are arranged in powers, the absolute quantity being always last, distinguished by an initial syllable denoting known quantity. Numeral co-efficients are employed, integer and fractional, unity being always noted: fractional co-efficients preferred to division of unknown quantities, and the negative dot always over the numeral, not after the literal character. The numeral co-efficient always after the unknown quantity. Positive or negative terms indiscriminately allowed to come first: and every power repeated on both sides of an equation, with nought for the co-efficient, when wanted.

The Arabian algebraists have no symbols, arbitrary or abbreviated, either for quantities known or unknown, positive or negative, or for the steps and operations of an algebraic process; but they express

* The reader will easily understand that, to save room, we put down a sort of table of contents, brief, but we hope intelligible. When we state a result algebraically, we mean the statement for European abbreviation, not for a translation from the work. We have not put down some things of minor importance, nor have we taken anything from the commentators without mention.

* In the old times of European algebra, some would call, for instance, the sixth power the 'cube-cube,' as being $a^3 \times a^3$; others would call the sixth power by the same name, as being the cube of the cube.

Digitized by Google

everything by words at length. The description of the Hindoo notation always led us to suspect that there was some communication with Hindoo algebra over and above that which was made through the Arabs; and the preceding account, with that which follows, will lead every one who knows the history of algebra to wish that there had been more of it.

The Viga Ganita contains as follows, it being presumed that the preceding account of Hindoo notation will prevent the reader from imagining that the algebraical symbols which we here employ are contained in the work:—The rules for addition, subtraction, multiplication, and division of positive and negative quantities: the rules for the square and square roots of the same, it being distinctly specified that the square root of a negative quantity is imaginary. Rules for the cipher, as in the Lilliwati; but here it is more distinctly stated that "the fraction of which the denominator is cipher is termed an infinite quantity." The commentator Chrishna is well worth quoting on this point:—"As much as the divisor is diminished, so much is the quotient increased. If the divisor be reduced to the utmost, the quotient is to the utmost increased. But if it can be specified that the amount of the quotient is so much, it has not been raised to the utmost, for a quantity greater than that can be assigned. The quotient therefore is indefinitely great, and is rightly termed infinite." Then follow arithmetical operations on unknown quantities, and combinations of them. Surds, the usual operations on them, the rationalization of surd denominators, and the extraction of square roots. The rule for the extraction of such a surd as the square root of $a + \sqrt{b} + \sqrt{c} + \sqrt{d}$ is worth citing as a proof of the decided character of their knowledge of this part of algebra. Let $\sqrt{(a^2 - b - c) = e}$, $\frac{1}{2}(a + e) = f$, $\frac{1}{2}(a - e) = g$, $\sqrt{(f^2 - d)} = h$; then the square root required is

$$\frac{\sqrt{f+h}}{2} + \sqrt{\frac{f-h}{2}} + \sqrt{g}.$$

The *Cuttaca*, or pulveriser, is the rule for the solution, in integers, of $ax \pm by = c$; a, b, and c being integers. There is no need to describe it, as it is the rule which is now found in every European book on the theory of numbers, and which proceeds by resolving $a \div b$ into a continued fraction. The Hindoos give no use of continued fractions except in this rule, though it is obvious, from the skill with which they manage the reduction of fractions to nearly equal fractions of more simple terms, that they must have applied continued fractions, directly or indirectly, probably by means of this very rule. We do not mean to say that they had continued fractions, but only the process involved in the use of them, and power of stashing their results.

The *Varga-pracriti*, or principle of the square is a rule which is remarkable, as the whole of it was not used in Europe till after the middle of the last century. It consists in a rule for finding an indefinite number of solutions of $y^2 = ax^2 + 1$ (a being an integer which is not a square) by means of one solution given or found, and of feeling for one solution by making a solution of $y^2 = ax^2 + b$ give a solution of $y^2 = ax^2 + b^2$. It amounts to the following theorem:—*If p and q be one set of values of x and y in $y^2 = ax^2 + b$, and p' and q' the same or another set, then $qp' + pq'$ and $qq' + pp'$ are values of x and y in $y^2 = ax^2 + b^2$.* From this it is obvious that one solution of $y = ax^2 + 1$ may be made to give any number, and that if, taking b at pleasure, $y^2 = ax^2 + b^2$ can be solved so that x and y are divisible by b, then one preliminary solution of $y^2 = ax^2 + 1$ can be found. Another mode of trying for solutions is the combination of the process with the *Cuttaca*, as follows:—Let $y = q$, $x = p$, satisfy $y^2 = ax^2 + b$: then solve $px + q = bu$, and

$$au^2 + \frac{2^2 - a}{b} \text{will} = \left(\frac{qx + ap}{b}\right)^2$$

and will be a square. It is then said that $y^1 = ax^2 - 1$ is impossible unless a be the sum of two squares; and some miscellaneous provisions are then given.

The *chalver* on simple equations requires no particular description; many of the examples are geometrical, as—Given the sides of a triangle to find the perpendicular. In the chapter on quadratic equations the well-known rules are given, and some cubic and biquadratic equations (special cases of course) are solved by completion of the cubes and squares. The two roots are mentioned, when positive, and it is said, "people do not approve an absolute negative number," on which the commentators speak as if the negative roots were seen, but not admitted. The property of the right-angled triangle is proved in a twofold way: first, by the similarity of the right-angled triangles formed by the perpendicular on the hypothenuse to the whole and to one another: next, by the method called Indian. Various of the propositions in Euclid's second book are proved. In the chapter on equations of more than one unknown quantity questions both of the determinate and indeterminate kind are considered.

In the next chapter are considered the equations $ax + bx^2 \quad y^2$; $(x+y)^2 + (x+y)^2 = 2x^2 + 2y^2$; $ax^4 - bx^2 = y^2$; $x - y = v^2$, $x^2 + y^2 = w^2$: "in what period is the sum of a progression continued to a certain period tripled, its first term being three, and the common difference two;" $ax^2 + by^2 = v^2$ and $ax^2 - by^2 + 1 = w^2$; $x^2 + y^2 = v^2$ and $x + y = w^2$; $x^2 + y^2 + xy = v^2$, and $xv + yv + 1 = w^2$;

$$x^2\left(\frac{xy+x}{2}\right) + \sqrt{(x^2+y^2)} + \sqrt{(x+y+2)} + \sqrt{(x+y-2)}$$
$$+ \sqrt{(y^2 - x^2 + 8)} = v^2;$$

$y + x^2 + 3 = v^2$, $y - x + 3 = w^2$, $y^2 + x^2 - 4 = t^2$, $y^2 - x^2 + 12 = u^2$, $\frac{1}{2}xy - x = y^2$, and $v + w + t + u + p + 2 = s^2$; $x^2 + y^2 + 1 = t^2$, $x^2 - y^2 + 1 = u^2$, $x^2 + y^2 - 1 = v^2$ and $x^2 - y^2 - 1 = w^2$; $3x + 1 = v^2$ and $5x + 1 = w^2$; $3x + 1 = v^2$ and $3x^2 + 1 = w^2$; $2x^2 - 2y^2 + 3 = v^2$ and $3x^2 + 3y^2 + 3 = w^2$; $x^2 - a = by$; $x^2 - 6 = 5y$; $5x^2 + 3 = 5y$; $4x + 3y + 2 = xy$; $xw + y = 20$ $(v + w + x + y)$; $x + y + x^2 + y^2 + xy = (23 - x - y)^2$; $4x + 3y + 2 = xy$; $2xy = 5b - 10x - 14y$.

Mr. Colebrooke has also given the algebra of Brahmegupta, being a chapter of the Brahme-sphuta-siddhanta. It contains the operations of algebra, barter, interest, progression, plane geometrical questions (the ratio of the circumference to the diameter is called 3 for practice, and $\sqrt{10}$ for more accuracy), and many of the more practical applications of arithmetic, as in the Lilliwati. Also the *Cuttaca*, simple and quadratic equations, the indeterminate equation $y^2 = ax^2 + b$, and miscellaneous problems. The whole of this algebra is contained in Colebrooke's 'Algebra, with Arithmetic and Mensuration, from the Sanscrit of Brahmegupta and Bhascara,' London, 1817. Dr. John Taylor, in 1816, published at Bombay a translation of the Lilliwati from the Persian, with an appendix on the mode in which arithmetic is now taught in Hindoo schools; and (London, 1813) Mr. Edward Strachey published a great part of the Viga Ganita, also from the Persian, with Mr. Davis's notes. It remains to mention that, by the extracts which were made from the Surya Siddhants, it appears that the Hindoo arithmetic of sines was more perfect than could be gathered from what is said of the mode of finding chords in the Lilliwati. They had a table of sines, calculated by the method of second differences for every $3\frac{3}{4}°$ from 0° to 90°; and among their astronomical uses of this table is one which is equivalent to the equation of the centre, as *circa da.* (Delambre, 'Astron. Anc.' ii. 456.) The minimum of trigonometrical formulæ which Delambre allows them (and he never grants them more than the Surya Siddhants) amounts to

$$\sin^2 z + \cos^2 z = 1, \sin 30° = \tfrac{1}{2}, \sin 60° = \tfrac{1}{2}\sqrt{3}$$
$$\sin^2 \tfrac{1}{2}A = \tfrac{1}{2}(1 - \cos A);$$

out how they were to find out a theorem equivalent to $\triangle^2 \sin x = -4 \sin^2 \frac{1}{2} \triangle x \sin x$, with only this amount of formulæ, he does not say.

The Mohammedans brought but a small part of this splendid body of algebra into Europe. The work of Mohammed ben-Musa, which is sufficiently shown by Dr. Rosen in his translation to have had an Indian origin (and indeed no one now questions that origin), contains merely simple and quadratic equations of the determinate kind, applied to various questions concerning money transactions. The algebra of Diophantus is more Indian in its character, as it treats entirely of those problems which are therefore called *Diophantine*, namely, integer solutions of indeterminate equations. It is, to all appearance, a part of the Indian algebra, similar in its contents to some of the classes of problems which fill the two last chapters of the Viga Ganita, translated into that strict and consecutive mode of demonstration which the Greek mathematicians (fortunately for us) never dispensed with. But, while granting to the first European algebraist full credit for the superior completeness of his modes of exposition, every comparison confirms us more and more in the impression that the Hindoo was his teacher: whether we consider the probable era of the older Indian algebraists, or the contents of the book itself, it is difficult to come to any other conclusion. The extravagant mania of Bailly, and the reaction caused by the writings of Delambre, have left no medium opinion upon Hindoo antiquity; and conclusions founded on the most sober views of history, and the most usual modes of chronological reasoning, have been entirely kept out of sight. In both our suspicions with respect to ancient intercourse between the two nations, namely, that the Indians received some astronomy between the time of Hipparchus and Ptolemy, and commmunicated some algebra, which was finally systemetised by Diophantus, we think we derive some support from the period at which the Grecian kingdom of Bactria was in existence. That principality was governed and partly colonised by Greeks at a time when the discoveries of Hipparchus must have been in the hands of Greek astronomers, if of those of any country; and to put a difficulty in the way of Bactrian Greeks knowing of Hipparchus, is to put a much greater one in the way of Hindoos having the same information. Again, though it is possible that Hindoos might have taught algebra to Greeks in Bactria, it is impossible that the latter could have communicated it to the former, since Bactria ceased to be a Grecian kingdom about B.C. 140; and Diophantus, though his time is not known, has never been supposed to have lived till two or three centuries after the Christian era. Granting, which is likely enough, that Greeks remained in Bactria after their government was overthrown by the Scythians, and that they retained the knowledge of Grecian arts; granting also that the descendants of these same Greeks became in time incorporated with the Hindoo race after Vieramaditya had checked the advance of the Scythians, and established a government which was likely enough to attract the remaining Greeks of Bactria, and more particularly the learned among them—this, though a reasonable account of the transmission from Greece to India of the astronomy of Hipparchus, gives no clue whatever to that of the algebra. Colebrooke's researches give a chain of algebraical writers who are cited, each by his successor, and who begin (even upon his

Digitized by Google

cautious mode of estimation) at the very time when Diophantus probably wrote: and to suppose anything like an immediate and direct transmission of a Greek writing to India, and an immediate cultivation and extension of its results, is to start an hypothesis which not only bears on the face of it the purpose which it is to serve, but pays far too high a compliment to the natives of India, whether as recipients of the knowledge of others, or as extenders of their own. There is one difficulty in the way of our own opinion as to the algebra, and that not a small one: Why did not the Greeks, or the Greek, obtain the Indian principle of local value in numeration at the same time as he learnt their algebra?

VIGILIUS, a deacon of the church of Rome, happened to be at Constantinople when Theodora, wife of the emperor Justinian, determined to depose Pope Sylverius, who had incurred her displeasure for reasons not very clearly ascertained. Anastasius Bibliothecarius says that Sylverius had refused to reinstate in the see of Constantinople the patriarch Anthimus, who had been deposed through the influence of Pope Agapetus I., the predecessor of Sylverius, on the charge of heresy. A charge was brought against Sylverius of having held correspondence with the Goths, who were besieging Rome in A.D. 537; upon which Belisarius, who commanded in that city, arrested Sylverius, stripped him of his pontifical garments, and banished him to Patara in Asia Minor. Belisarius then, according to the instructions which he had received from Theodora, ordered the clergy of Rome to proceed to a new election, suggesting at the same time the deacon Vigilius, who had been employed at the court of Constantinople, as the fittest candidate. Vigilius was accordingly elected in November 537, and he soon after repaired to Rome, where he was installed in his see through the influence of Belisarius. His election however was generally looked upon as having been forced and unlawful, and the historians of the Church consider him as an intruder as long as Sylverius lived. Vigilius is said by some to have agreed with Theodora to reject the Council of Chalcedon, and to receive into his communion Anthimus, Theodosius, bishop of Alexandria, and others who entertained the Eutychian doctrines. Liberatus Diaconus and Pagi quote letters of Vigilius in proof of his connivance at these doctrines. It is also said that he paid a large sum of money to Theodora to obtain his election. In the year 538 Sylverius, who had been sent back to Italy by the emperor Justinian, to be tried concerning his alleged treason, died; Procopius says that he was put to death by order of Antonina, the wife of Belisarius; others say that he was starved to death in the island of Ponza by order of Vigilius, who after his death remained undisputed possessor of the see of Rome. Vigilius has been since generally acknowledged as legitimate successor of the long line of predecessors death. From that time also Vigilius showed himself less docile to the caprices of the court of Constantinople; he maintained the authority of the Council of Chalcedon, and he even incurred the displeasure of Justinian, because he would not subscribe to the theological opinions of that emperor.

In the year 545 Vigilius left Rome for Sicily, from whence he sent supplies to Rome during the subsequent siege of that city by the Goths under Totilas. In 547 Vigilius repaired to Constantinople, at the request of Justinian, who was warmly engaged in a theological controversy, which is known in Church history by the name of the 'three chapters.' Vigilius, after remaining at Constantinople for some years, was obliged to escape from the wrath of the emperor to Chalcedon, where, in 552, he took refuge in a sanctuary. In the following year Justinian convoked a general council at Constantinople, which was to decide upon the question of the 'three chapters,' or, in other words, to condemn certain controversial writings of three bishops of the preceding century—Theodore of Mopsuestia, Ibas of Edessa, and Theodoretus. Vigilius, who considered those writings to be orthodox, refused to condemn them, and for this he was banished, with other bishops of his own opinion, to the island of Proconnesus, from which he was recalled, in 554, at the urgent entreaty of the clergy of Rome, supported by the intercession of Justinian's successful general Narses. Meantime the Council of Constantinople had condemned the 'three chapters,' and its decision was now sanctioned by Vigilius, after which Justinian permitted him to return to Italy. On his way to Rome by sea, Vigilius landed at Syracuse, where he died of the stone, of which he had been suffering for some time, in the seventeenth year of his troubled pontificate, on the 15th of January 555.

(Muratori, *Annali d'Italia*, and the authorities therein quoted.)

VIGNO'LA, GIA'COMO BAROZZI, a very eminent Italian architect, and one of the greatest modern authorities in his art, was born in 1507, at Vignola, in the territory of Modena, whence he derives the name by which he is more generally mentioned than by his family appellation. Giacomo was the only child of his parents, and by the death of his father he was left at an early age entirely dependent upon his mother. Having manifested some taste for drawing, he was sent by her at a suitable age to Bologna to study painting, but he made so very little progress that he determined to abandon it and apply himself to architecture, a study he had been led to by that of perspective, in which he had discovered principles and practical rules that in the then state of the science were eminently useful. He now set out for Rome in order to make himself acquainted with ancient architecture by examining the various remains in that city; and afterwards he made a series of drawings of them for an academy or architectural society which was at the time just established under the auspices of several persons of rank. In the meantime, or previously to being so employed, he had supported himself by painting. What was the length of his first residence at Rome is not known, but it could hardly have been one of many years, because, about 1537, he accompanied Primaticcio to France, where he remained two years, during which he made several models and designs for Francis I., none of which however was executed, owing to the unfavourable state of public affairs. The Château Chambord indeed has been erroneously attributed to him, but it was erected somewhat earlier, and is of a very different character from any of his works.

On returning to Italy he fixed himself for awhile at Bologna, where, in competition with many others, he made designs for the façade of San Petronio, in which he endeavoured to combine the antique, or rather the style founded upon its orders, with the Gothic of the original fabric; but, as not unfrequently happens under such circumstances, neither his nor any of the other designs were adopted, for the whole scheme fell to nothing. He was however employed upon various works in that city, and among them are the Casa Bocchi (so very favourable specimen of his taste, as he was obliged to comply with that of the proprietor), alterations of the Bank or 'Change, the 'Navigilio,' or canal leading to Ferrara, and the Palazzo Isolani at Minerbio, at a short distance from Bologna. So poorly were his services for the work of the Navigilio recompensed, that on its being completed he took his leave of Bologna and went to Piacenza, where he designed the ducal palace, leaving however the building of it to his own Giacomo. It was perhaps about this period that he erected the church at Mazzano, the Madonna degli Angeli at Assisi, the chapel of San Francesco at Perugia, and other structures in various parts of Italy, the precise dates of which are unknown. The church of Santissimo at Loreto (1550-56) he was introduced by his friend Giorgio Vasari to that pope, who had known him while legate at Bologna, and who appointed him his architect. Besides the direction of the Trevi aqueduct, his new patron employed him almost immediately on the villa for himself, called 'Villa Papa Giulio,' or 'Villa Giulia,' but has always been regarded as a superior piece of architecture, and it forms the subject of a splendid atlas volume, published by the architect Stern in 1788; nevertheless it is difficult to account for its celebrity, there being little in the casino the order to appear insignificant and the recumbent nomeaning. In such cases however the established reputation of a work generally silences criticism, and deters from nice examination into merits which may safely be taken upon trust; accordingly Stern speaks of this building in very encomiastic terms, as does likewise Quatremère de Quincy. After the death of Julius, Vignola found a liberal patron in his nephew the Cardinal Alexander Farnese, for whom he erected his chef-d'œuvre, the celebrated palace at Caprarola, a magnificent edifice of very peculiar character, it being a mixture of military and civil architecture, both external in plan, and presenting a lofty mass reared upon an equally lofty substructure of terraces of the same form. Yet although sufficiently stately, there is also something both lumpish and monotonous in its general outline. Within is a circular cortile with open galleries or arcades, with which all the principal apartments immediately communicate, and but for which they would be merely thoroughfares to each other. The magnificence of the interior consisted chiefly in the frescoes and other paintings with which the walls and ceilings of the apartments were decorated, and of which a very circumstantial account has been given by Vasari in his Life of Taddeo Zucchero, the principal artist employed upon them. Philip II., on the part of whom he had been consulted relative to the designs for the Escurial, would willingly have engaged Barozzi in his immediate service, but the architect excused himself on the score of advanced age and infirmity, and his having also undertaken the superintendence of the works at St. Peter's, on the death of Michel Angelo (1564). He therefore remained at Rome, where he died July 7th, 1573.

What has mainly tended to confer on Vignola the celebrity he enjoys throughout Europe is his 'Traitée on the Five Orders,' which has been received as an authority in regard to them; but though it has been of service to the profession, it has done injury to the art, it being impossible to say what variety might have been produced in regard to 'orders,' had architects been left to treat them as freely as other parts of design, instead of tying themselves down to fixed rules, which after all are of little use, inasmuch as they do not secure any further merit. Of Vignola's own designs, &c., the best collection is that entitled 'Œuvres complètes de J. B. de Vignola, publiées par H. Labas et F. Debret,' in large folio, and in outline, Paris, 1823, &c.

(Milizia, *Vite*; Quatremère de Quincy, *Célèbres Architectes*; Vasari.)

VIGNOLES, ALPHONSE DES, was descended from a Protestant family of great antiquity in Languedoc, where he was born, at the

château of Aubais, October 29th, 1649. He had been designed by his father for the military profession; but preferring the Church, he went through the usual studies, first at Geneva, and then at Saumur, after which he spent some time in England. Returning home in 1675, he became minister at Aubais, and, after some time, at Calais, where he remained till the revocation of the Edict of Nantes in 1685. He then retired to Geneva, whence after a time he removed to a church in Berlin, and then to that of Brandenburg; but when the Royal Society of Berlin was founded in 1701, being chosen one of the first members, and invited on the suggestion of Leibnitz to take up his residence in that city, he returned thither, and being appointed minister of the neighbouring church of Copenick, he remained there till his death, at the age of ninety-four, on the 24th of July 1744.

Des Vignoles is the author of many works in the 'Memoirs of the Royal Society of Berlin,' and in the periodical journal called the 'Bibliothèque Germanique,' of which he became one of the editors in 1711; but his principal work is his 'Chronologie de l'Histoire Sainte et des Histoires Etrangères depuis la sortie d'Egypte jusqu'à la Captivité de Babylone,' which appeared in 2 vols. 4to, at Berlin, in 1738. Chronology was the study to which he had chiefly devoted his attention.

VIGNY, ALFRED, COMTE DE, one of the most estimable of the modern French poets, was born at Loches, in the department of Indre-et-Loire, on the 27th of March 1799. His father was one of the few of the old French nobility, who did not emigrate. Alfred was educated with great care at one of the colleges in Paris. After the Restoration of Louis XVIII. he was admitted as one of the gentle Musketeers of the king's household, in which the privates ranked as officers, and wore the spanelette. This regiment was dissolved during the Hundred Days; whereupon De Vigny was transferred to the Royal Guard. In 1823, he passed into a regiment of the line, in hope of taking part in the expedition into Spain; but his regiment continued in cantonments in the Pyrenees during the whole campaign. Already a number of fugitive pieces, both in poetry and prose, besides one or two dramas, had drawn attention to the young nobleman, when, in 1825, he formed the acquaintance of a rich English lady, whom he married in the following year. At the same time, he withdrew from the army, to devote himself exclusively to literature. His earliest attempts had been published in various Parisian periodical works in 1820, since which his 'Dolorida,' his 'Eloa,' his 'Maise,' and others had appeared in that evanescent form; but in 1826, they were collected and published in a volume, under the title of 'Poemes Antiques et Modernes,' five editions of which were sold during the first two years. In 1826, likewise, his clever historical romance, 'Cinq-Mars, ou une Conjuration sous Louis XIII.,' in 2 vols., was printed. He had meditated the plot of this tale, during his sojourn in the Pyrenees. It ran through several editions, the sixth being published in 1840. The style of Cinq-Mars is pure, natural, and graceful; the character of Cardinal Richelieu is drawn with great strength, the figure of the king, Louis le Juste, is finely conceived; his history, being perhaps equally true to life. This romance was soon translated into most European languages, and from it may have been taken some hints for the fine conception of the drama of 'Richelieu' by Sir E. Bulwer Lytton. The later editions of this production have been preceded by a thoughtful and instructive preface, abounding in deeper views, and exhibiting greater research and more subtle criticism, than is usually found among romancists. His 'Stello ou les Diables bleus,' a narrative delivered by a physician to one of his patients, was given to the public, in 1832; it comprises three separate stories, exemplifying the struggles, aspirations, disappointments, and untimely death of three poets, Gilbert, André Chénier, and Chatterton. In these tales, the natural interest belonging to them is impaired by a vague philosophy, which the author appears to have taken up as a caprice. In several passages we miss the graceful pen of De Vigny, and are reminded of that of Victor Hugo.

Among his dramatic productions we may name his version of 'Othello,' and 'Le Marchand de Venice,' which appeared in 1830; his 'Maréchale d'Ancre,' produced in June 1831, and his 'Chatterton,' which was produced in 1835. The success of this last was prodigious, partly owing to the exciting nature of the subject in French hands, and partly owing to the excellent acting of Madame Dorval, then the rising star of the Parisian stage, whom all Paris hastened to see. Alfred de Vigny is the author of many articles in the 'Revue des Deux Mondes.' A complete edition of his works in 8 vols. was published in 1838. [*See* SUPPLEMENT.]

VIGORS, NICHOLAS AYLWARD, was born in 1787, at Old Leighlin, in the county of Carlow, where his family had long lived. He received his early education at home, and afterwards became a student at Trinity College in the University of Oxford, where he gave considerable proof of his classical and literary acquirements, by the publication, in 1810, of 'An Enquiry into the Nature and Extent of Poetic Licence.' In the year 1809 he had an ensigncy purchased for him in the Grenadier Guards, and was present at the action of Barossa, in the early part of 1811, where he got severely wounded. On his return to England he quitted the army, and devoted himself to the study of zoology, especially of birds and insects. In both these subjects he acquired great knowledge, and formed extensive collections, which he at a subsequent period presented to the museum of the Zoological Society. On the death of his father he succeeded to the family estate, and, in 1832, became the representative in parliament of the borough of Carlow, for which and for the county of Carlow he continued to sit until the termination of his life, on the 26th of October 1840.

Although Mr. Vigors has written no work devoted to the subject of zoology, he has contributed a large number of valuable papers to the 'Transactions' of the Linnean Society and of the Zoological Society, and the pages of the 'Zoological Journal.' He was an advocate of the circular or quinary system of arrangement as propounded by Mr. W. S. Mackay, in his 'Horæ Entomologicæ;' and the two papers for which he is best known, the one 'On the Natural Affinities that connect the Orders and Families of Birds,' and the other, 'On the Arrangement of the Genera of Birds, are devoted to the applications of this system to ornithology. He was one of the founders of the Zoological Club of the Linnean Society, from which sprung the Zoological Society, of which society he was the first secretary, and through the whole of his life he devoted much of his time and talents to its interests. In his papers he did not confine himself to one department of zoology, but there are many in the 'Zoological Journal' and 'Proceedings of the Zoological Society' that attest his acquirements in the whole range of zoology. He died suddenly in the midst of useful career, and has left among those who knew him a lively sense of his worth as a friend and of his talents as a man of science.

VIJA, GANITA. [VIGA GANITA.]

VILLANI, GIOVANNI, born at Florence in the latter part of the 13th century, was a merchant by profession, and travelled in various countries in the pursuit of business. He also filled several offices in the service of the republic of Florence, was repeatedly one of the priors or executive council, and was employed in negociating the peace with Lucca and Pisa in 1317. He afterwards served in the Florentine army in the war against Castruccio Castracani, after whose death, in 1328, he negociated the peace with Lucca. He was involved in the bankruptcy of the mercantile company of the Bardi in 1345, by which he was a great loser, and he was even imprisoned in consequence of it as an insolvent. He died of the plague in 1348. Villani wrote the history of his country, in twelve books, from the building of Florence to the time of the author's death. He does not however confine himself to the history of Florence, but he relates also the occurrences of other countries, both of Italy and out of Italy, so as to obtain the character of a general history. The earlier period of his narrative he exhibits considerable credulity, and a want of critical skill, but as he draws near to his own times, he can be more depended upon for correctness of facts and impartiality. Villani, though belonging to the Guelph party, appears to have been, on a whole, comparatively free from party spirit. His style is remarkably clear; his language is the pure Florentine of his age, some of the expressions of which however are now become antiquated. Villani is liable to the charge of plagiarism, for he has copied in great part the older chronicle of Ricordano Malespini, which once existed in MS. him, which chronicle, including the continuation by Giacotti Malespini, comes down as far as the year 1236. From this epoch, however, to that of Villani's death, 1348, Villani's history is original. The work appears to have lain forgotten for nearly two centuries, until it was first printed at Venice in 1537. Machiavelli quotes Villani once at the beginning of the second book of his 'Storie Fiorentine,' but he does not seem to have followed or consulted him in his narrative, and the other historians anterior to Machiavelli do not mention Villani's work. It is worthy of remark, that the chronicle of Dino Compagni, also a writer of the 14th century, whose interesting narrative embraces part of the period of that of Villani, remained unedited till the 18th century, when Muratori published it in his great collection.

The first ten books of Villani's history were published at Venice in 1537, and the eleventh and twelfth books were afterwards published at Florence in 1554, under the title, 'La Seconda Parte della Cronica Universale de' suoi Tempi, di Giovanni Villani, Cittadino Fiorentino.' In 1587 Bacelo Valori published a new and more correct edition of the whole at Florence, and dedicated it to Francesco di Medici. 'Historia di Giovanni Villani, Cittadino Fiorentino, nuovamente corretta, e alla sua vera lezione ridotta.' This is the edition which is quoted by the academy of La Crusca as a 'Testo di Lingua,' or a book of authority in matters of language.

MATTEO VILLANI, brother of Giovanni, wrote, after his brother's death, a continuation of his history, and brought it down to the year 1363, in which he died. His veracity has been praised by Muratori, but his style is inferior to that of his brother.

FILIPPO VILLANI, Matteo's son, also added a continuation to his father's narrative, including the years 1363-4. The whole body of history by the three Villani was published together by Muratori, and has been reprinted several times since.

Filippo Villani was also a Latin writer; he wrote, 'De Origine Civitatis Florentiæ et ejusdem famosis Civibus.' The first part of the work, which treats of the origin of Florence, is full of fables, and it has never been printed. Of the second part which contains short biographies of distinguished men of Florence, detached biographies in the original text have been published in the Life of Ambrosius Camaldulensis, by Mehus, who discovered the manuscript, and some others by Sarti; Moreni published those of Dante, Petrarch, and Boccaccio,

Digitized by Google

under the title, 'Philippi Villani Vitæ Dantis, Petrarchæ, et Boccacii,' Florence, 1826. Mazzuchelli published an old Italian version of the Lives of Filippo Villani by an anonymous translator, before the discovery of the Latin text: 'Le Vite d'Uomini illustri Fiorentini, scritte da Filippo Villani, collo Annotazioni del Conte Mazzuchelli,' 1747.

Filippo Villani wrote also a work 'De Origine Regum Francorum,' which we believe is still inedited. He died about 1404.

Giovanni Villani, the Florentine historian, must not be confounded with another Giovanni Villani, who wrote chronicles of the town of Naples, and also of the kingdom of Sicily, which are of no great value.

(Tiraboschi, *Storia della Letteratura Italiana;* Cornianì, *I Secoli della Letteratura Italiana;* Gamba, *Serie dei Testi di Lingua.*)

VILLANUEVA, JOAQUIN LORENZO DE, a learned and liberal Spanish author, was born at Jativa, in the kingdom of Valencia, on the 10th of August 1757, and studied at the University of Valencia, where Muñoz, well known for his 'History of the New World,' was one of his tutors. After taking holy orders he fixed his residence in the capital, where he became one of the literary ornaments of the reign of Charles III., which is regarded as that of the revival of sound literature in Spain. His most studied work at this epoch is his 'Año Cristiano de España,' or Spanish Christian Year; an account of the festivals of the Spanish Church, the lives of its saints and martyrs, &c., which, although it extends to nineteen octavo volumes, has passed through several editions. Another work by him, 'De la lección de la sagrada Escritura en lenguas vulgares' ('On the Reading of the Holy Scriptures in the common languages), folio, Valencia, 1791, in which he advocated that practice, was not looked upon with favour by his ecclesiastical brethren; nor did he regain favour by promulgating the doctrine that the jurisdiction of the tribunal of the Inquisition was incompatible with the fundamental laws of Spain. He held nevertheless the office of court preacher and confessor of the royal chapel at the time of the general convulsion of Spanish affairs on the invasion of 1808, when he became a distinguished member of the patriotic and constitutional party. In 1810 he was chosen a member of the Cortes, and in 1812 he supported the principles of constitutionalism by arguments from the philosophy of St. Thomas Aquinas in a dissertation entitled 'Angelicus Fuentes ó el Tomista en las Cortes.' On the return of King Ferdinand he was shut up for six years in a sort of imprisonment in the monastery of Scala Dei, but allowed to soften the confinement by making use of the treasures of a good library. The resumption of constitutional government in 1820 led to his liberation, and he was sent by the Cortes on a mission to the court of Rome, whose pretensions he had always been conspicuous for opposing, while defending what he considered the rights of the Church of Spain, in a spirit analogous to that which once animated the Gallican clergy. His negociations met with no success; and on the overthrow of the constitutional government he thought it advisable to emigrate to England, from which he afterwards transferred his residence to Ireland. While in London he published what he called his "literary life" ('Vida Literaria de J. L. de Villanueva,' 2 vols. 8vo, 1825), but the work is too much occupied with dissertations on the rights of the Spanish Church and on the Council of Trent to be very attractive to an English reader. He translated Paley's 'Natural Theology' and some other works into Spanish; but his chief literary labour here was a dissertation in Latin on Irish antiquities and the colonisation of Ireland by the Phœnicians, 'Ibernia Phœnicea seu Phœnicum in Ibernia incolatus,' Dublin, 1831. He died at Dublin, on the 26th of March 1837. He was a poet as well as a prose writer, and a volume of his select poems, 'Poesias Escogidas,' appeared at London in 1833.

His younger brother, JAIME VILLANUEVA, born at San Felipe in 1765, and first a Dominican, then a secularised priest, shared his opinions, his literary fame, and his exile. He was the author of a 'Literary Tour to the Churches of Spain' (Viage Literaria á las Iglesias de España), commenced at Madrid in 1803, and left imperfect in thirteen or fourteen volumes; a work full of valuable information on the ecclesiastical archives of that country. His brother Joaquin Lorenzo contributed many portions to the earlier volumes. Jaime Villanueva died at London, on the 14th of November 1824.

VILLARET, CLAUDE, was born at Paris about the year 1715, or soon after, and was educated for the bar; but a love of light literature and more lucrative diminishing him for that or any other laborious profession, he took to writing books, and produced, in 1745, a romance entitled 'Histoire du Cœur Humain, ou Mémoires du Marquis de —;' besides a one act play, entitled 'Quartier d'Hiver,' in which he was assisted by two other writers; and some other things of the same kind, said to be all of little value. It is not certain however that he was really the author of all the pieces that have been attributed to him. In 1748 his embarrassments forced him to leave Paris, upon which he joined a company of provincial players, being smitten, it is said, by the charms of one of the females. He now took the name of Dorval, and made his first appearance at Rouen in the character of a lover; but he soon rose to a higher range of parts, and at length became manager of a company, which performed at Liège. He left the stage however in 1756. In 1758 he published anonymously at Geneva an answer to Rousseau's 'Lettre sur les Spectacles,' under the title of 'Considérations sur l'Art du Théâtre,' which is said to have been the best that appeared next to that by d'Alembert. This was followed in 1759 by a volume, also anonymous, of selections from Voltaire, which he called 'Esprit de Voltaire,' and which was well received. In 1760 he returned to Paris with some literary reputation, and his friends got him the office of first clerk to the Chamber of Accounts (Premier commis à la Chambre des Comptes), an appointment which led him to the study of the national historians of the middle ages; so that when the booksellers Desaint and Saillant were looking out for a writer to continue the 'Histoire de France,' commenced by the Abbé Velly, recently dead, they were induced to select Villaret. He conducted or compiled and wrote the work, from the 226th page of the 8th volume to the 348th page of the 17th, being the portion extending from 1329, the second year of Philip de Valois, to 1469, the 9th year of Louis XI. Villaret's first volumes are said to have so greatly extended the sale of the work, that the publishers raised the salary of their new editor to triple what they had paid to his predecessor; but as this would have made his remuneration not less than 4500 livres per volume, the statement is regarded by the writer of his life in the 'Biographie Universelle' as more than doubtful. This writer considers Villaret's to be the best written portion of the work, and intimates that it has been generally so esteemed by the public. The Abbé de Castres, on the contrary (in his 'Trois Siècles de la Littérature Française,' iv. 436), describes Villaret as being to his predecessor what Seneca is to Cicero; and asserts that he wanted the art of skilfully weaving his researches into the substance of his narrative—"il n'a pas eu, comme son modèle, l'art de fondre avec adresse ses recherches dans la narration." Villaret also held the office de for him, of secretary to the dukes and peers (Secretaire des Ducs et Pairs); and he is said, in the latter part of his life, to have been concerned in one or two other literary undertakings of the day. He died in February 1766. His successor in the compilation of the 'Histoire de France' was the Abbé Garnier.

VILLARS, DOMINIQUE, French botanist, was born on the 14th of November 1745, in a hamlet of the village of Noyer in Dauphiné. His father taught him reading and writing, and he learned Latin and geometry of the parish priest. These he was only fourteen years old his father died, and being the eldest in the family, at that early age he was obliged to superintend the duties of the farm on which his family lived. He was also appointed to his father's post of parish registrar, and in order to fit himself for his duties, he received instruction from a notary, in whose library he was left with books on natural history, which so engaged his attention that he determined to pursue the study of botany and medicine at his leisure. This led his mother to fear that he would neglect his agricultural pursuits; and accordingly, at the age of seventeen, she persuaded him to marry, in the hope that this would be a check to his pursuit of science. But in this she was disappointed; for in 1765 Villars made an excursion through Lyonnais, Bourgogne, La Franche-Comté, and Bresse, and collected many plants, and otherwise added to his knowledge of natural history. He afterwards became known to the Abbé Chalix, a good botanist, with whom he made many excursions in the mountains of Gapencois. He thus became acquainted with M. de Marchéval of Grenoble, and in 1771 proceeded to the military hospital of Grecohle for the purpose of studying medicine. Here his botanical knowledge soon brought him into notice, and in 1773 he gave a course of lectures on botany to the pupils of the hospital. From this period to 1776 he made several excursions in Bas-Dauphiné, Provence, Languedoc, and La Grande Chartreuse, for the purpose of studying the natural history, more particularly the botany, of those districts. In 1777 he visited Paris, where his reputation as a botanist secured him a very flattering reception. In 1778 he took his degree as Doctor of Medicine, and would have returned to Noyer to practise medicine, but his friend M. Marchéval secured him an increase of stipend for his lectures at Grenoble, and in 1782 he was appointed physician to the hospital; he continued in this position till the suppression of the hospital by the French government in 1803. As this was unexpected, he remained for some time in considerable difficulties, but in 1805 he was appointed professor of botany and medicine in the school of medicine at Strasbourg, where he remained till his death, which took place on the 27th of June 1814.

Villars wrote several works on botany and medicine, but that which secured him the greatest reputation is his 'Natural History of the Plants of Dauphiné' (Histoire Naturelle des Plantes du Dauphiné). This work was published in 4 vols. 4to, in 1786 and successive years; it contains 65 plates of the plants described. Each of the volumes contains a preface, in which an account is given of the various excursions which he made. All the plants are arranged according to a classification of his own, in which he reduces the number of the Linnæan classes to twelve, by considering only the number of the stamens as a character of the classes. Under these classes he arranges 27 natural orders, named after the 'Fragments' of Linnæus. It also includes a dictionary of terms, and lists of plants found in particular districts. This work was submitted to the French Institute, and a critical report given of its merits by Jussieu, Geoffroy, and Tessier. Although in some respects unfavourable to the work, the author was modest enough to print each report of the members of the Institute at the commencement of the volumes as they appeared. In 1801 he published a catalogue of the plants growing in the botanic garden at

Digitized by Google

Strasburg, in which he arranged the plants accordiog to the system of Jussieu. He published several other books and memoirs on various departments of natural history and topography. His principal work on medicine was entitled 'Principes de Médicine et de Chirurgie,' and was published at Lyon in 1797. He also gave an account of an epidemic fever which prevailed in Dauphiné during the years 1779 and 1780. At his death he left behind him an extensive library and a large collection of plants. In a prospectus of his large work on plants, he named a species *Berardia*, after Berard, an apothecary, who lived at Strasbourg, and was a contemporary of the Bauhins, and who left behind him a manuscript work on plants, still in the public library at Strasbourg. A genus of plants has been named in honour of Villars, *Villarsia*.

VILLARS, LOUIS HECTOR, a maréchal of France, and one of its most illustrious soldiers, was born at Moulins in 1653. He studied at the college of Juilly, and was, on quitting that seminary, enrolled among the "pages de la grande écurie." During an excursion of the court to Flanders, Villars obtained leave to visit Holland, and he afterwards accompanied his relation St. Géran, envoy to the Elector of Brandenburg, to Berlin. On his return to France he served in Holland as a volunteer in the corps commanded by Louis XIV. in person. The spirit of enterprise and observation beyond his years which had spurred him to visit foreign countries, he carried into the camp. The king, who had formerly distinguished him among the other pages on account of his fine figure, remarked one day, "A single shot can't be fired without this boy starting from the ground to witness it." Villars's courage and activity, and perhaps his fine figure, obtained for him, although his family was out of favour at court, a troop of horse at the age of nineteen.

The next two years he served in Germany under Turenne, who entertained a high opinion of his talents as a partisan. The Prince of Condé also distinguished him from the crowd of young officers. The mingled good sense and gallantry which he showed at the battle of Sénef procured for him a regiment of cavalry in 1674, before he had completed his twenty-first year. In 1674 till the end of the Dutch war in 1678, Villars served in Flanders under the Maréchal de Luxembourg, and in Alsatia under the Maréchal de Crequi. The minister Louvois, who had quarrelled with the Maréchal de Belle-fonds, Villars's uncle, extended his irreconcilable enmity to the whole family. The young soldier felt that he had nothing but himself to rely upon; and he appeared to multiply himself in his search of opportunities of distinction.

The next ten years of the life of Villars were spent principally in diplomatic employments. On his return to court after the peace of 1678, he gave the rein to his amorous propensities, to an extent which attracted general attention, and occasioned much disturbance. He was ordered to rejoin his regiment, but any fear of having lost the king's favour was soon dispelled by being sent to Vienna to condole with Leopold I. on the death of the empress-mother. At Vienna he gained such an influence over the mind of the Elector of Bavaria, that he detached him from the Austrian interest, and rendered him subservient to the views of France. With the approbation of Louis, Villars accompanied the elector on his return to Munich, and followed him into Hungary, when he assumed the command of the Bavarian contingent in the imperial army levied against the Turks. Here, as usual, Villars distinguished himself by his impetuous but not uncalculating valour. On his return to Munich he found a new and powerful emissary opposed to him—the beautiful and voluptuous Countess of Kaunitz. The first use made by this lady of the complete ascendancy which she soon gained over the elector, was to insist that Villars should be removed from the court. Notwithstanding this partial failure, Louis was satisfied with his ambassador's conduct. Villars was admitted to private interviews; Madame Maintenon received him at St. Cyr. At last, Louvois relented, and in 1688, on the eve of the war occasioned by the league of Augsburg, conferred upon him the appointment of commissary-general of the cavalry.

Villars was sent to Munich to attempt to regain his influence over the elector, and detach him from the alliance of Austria. In this he failed, and his life was even in danger from the Austrian party in Bavaria. He was next appointed to command the cavalry of the Maréchal d'Humières, whose army was cantoned in Flanders with orders to act on the defensive. Villars, tired of this inactivity, resumed his old occupation of partisan, and levied contributions as far as Brussels. In 1689 he was created maréchal-de-camp. During the two following years he commanded a body of 15,000 men, which formed a reserve to the army of the Maréchal de Luxembourg. He was subsequently sent to the Rhine to assist with his counsels the Maréchal de Joyeuse, who was hard pressed by the Prince of Baden. In this service he continued till repose was for a short time restored to Europe by the peace of Ryswick in 1697.

The intrigues which preceded the Spanish War of Succession were now in full vigour. In 1699 Villars was entrusted with the delicate mission of ambassador-extraordinary to Vienna. He spent three years at that court, at the time when it and the court of Versailles were incessantly busied by every means short of actual war to thwart each other's views upon the throne of Spain. Villars, with a sleepless patience, strangely contrasting with his impetuosity in war, watched and unravelled all the tortuous intrigues of the Austrian court. He kept Louis and his ministers informed of every movement of Austria, and by blunt and opportune applications more than once deterred the emperor from steps which would have promoted his views. The personal animosity felt by the Austrian court to Villars was extreme; he was personally insulted, attempts were made to implicate him in the rebellious movements of Hungary, and his life was threatened. The courtiers afflicted to shun him; Prince Eugene alone continued on a footing of unreserved friendly intercourse. Villars persevered, and though more of the honour of insuring the accession of Louis' grandson to the Spanish throne was attributed to others than he felt to be consistent with a due sense of his services, even Louis XIV. was satisfied with his conduct.

On the commencement of hostilities in 1701 Villars was sent to the army commanded by Villeroi in Italy. Dissatisfied with his general he obtained his recall. On his return to Paris he married Mademoiselle de Varangeville, to whom he was passionately attached. On the appointment of Catinat to the army of Germany, Villars joined him, but it is alleged that he found the genius of his commander enfeebled by age. In 1702 Villars was sent, at the head of thirty battalions, forty squadrons, and thirty pieces of artillery, to disengage the elector of Bavaria, who was surrounded on all sides by the Austrian troops. Villars had now attained his forty-ninth year, and this was the first time he had commanded in chief.

The events of Villars's campaign in Germany in 1703 are faithfully and instructively portrayed in his correspondence with the elector, Louis XIV., and his minister-at-war, and the letters of his general officers under his command, published at Amsterdam in 1762. The French general was everywhere successful, but the imbecility of the Elector of Bavaria neutralised all his victories. Disgusted with his position, Villars petitioned to be recalled, and by his importunity wrung from the king a reluctant permission. On his return to France, it was proposed to send him to Italy, but the Duke de Vendôme was his senior maréchal, and in his connection with the Elector of Bavaria Villars had had enough of military partnership with a prince of the blood. He was, however, consulted upon his understanding the Italian campaign, for there was a more important charge to intrust to him.

This charge was to terminate the war of the Cevennes. With the sanction of the king, he repaired to the scene of action, resolved to put an end to the troubles less by rigour than by gentle methods. In Lamoignon, the intendant of the province, he found a coadjutor participating in his sentiments, master of the necessary local information, and prompt in action. Together these associates pursued the Camisards into their most secluded retreats. A few examples of severity to those who resisted were followed by the extension of lenity, and even concessions to their religious scruples, to all who laid down their arms. Cavalier, the ablest leader of the Camisards, was gained by the humanity and soldierly frankness of Villars. Peace was in the eve of being restored to the province, when a descent of England and Savoy rekindled the dissensions. The imsincerity of the court co-operated with foreign intrigue, but the watchfulness of Villars cut off all assistance from beyond the frontier, and the insurgents of the Cevennes ceased to be dangerous. Villars saved his king, at the imminent peril of his own life, from the embarrassment of a civil war. He was received with the highest honours on his return to Versailles.

From the spring of 1705, till the conclusion of the peace of Rastadt in 1714, the life of Villars was a series of campaigns. Sent by the king in the former year to inspect and strengthen the defences of the eastern frontier, he took post on the heights near Fronsberg, where he covered Thionville, was in a position to succour Luxembourg if necessary, and, by means of the fortified posts at Bousonville and Bourgaicha, kept open the communication with Sarre-Louis. Confident in the strength of his position, he did not entrench it, lest he should render his soldiers apprehensive. Marlborough appeared before this camp, at the head of 110,000 men; he examined it at all points for four days, and then retired. This encampment, more generally known by the name of Sirek than Fronsberg, astonished everybody. The prompt decisim and fearlessness of Villars were well known, but the skill shown in selecting a strategic position, and the self-control evinced in keeping on the defensive, were unexpected. The moment the enemy withdrew, he gave vent to his natural impetuosity by resuming the offensive; he burst into Alsatia, forced the lines of Weissenburg, presented himself before Lauterburg, and, to conceal the weakness which prevented him laying siege to that place, crossed the line between Fort Louis and Strasbourg, and laying the whole country between his river and Schwarzwald under contributions, closed the campaign of 1705. In 1706 he took Lauterburg and Hagenau, in the latter of which the enemy kept his reserves of artillery and stores. This success was neutralised by Villars's loss of the great battle of Ramillies in Flanders, where he was forced to succumb to the superior genius of Marlborough, and by the minister Chamillard's withdrawing some of his best troops. In 1707 Villars crossed the Rhine; forced the lines of Stollhofen on the 23rd of May; established his head-quarters at Rastadt on the evening of the same day, and the next occupied Stuttgard. He invited Charles XII. of Sweden, who had invaded Saxony, to make a junction with his army under the walls of Nürn-

Digitized by Google

berg, and concentrate their forces against Austria; but the invitation was declined. Troops were again withdrawn from him, and he was obliged to re-cross the Rhine. In 1705 he was sent to command on the frontier of Savoy, but the tardiness of those to whom the arrangements were intrusted caused the campaign to terminate without effect. In 1709 he was sent to re-organise the dispirited and demoralised army of Flanders. At the battle of Malplaquet he was wounded early in the day: he endeavoured to continue to direct the troops from a litter, but fainted, and was borne from the field. His wound was dangerous, and kept him inactive the rest of the year. The campaign of 1710 was desultory: repeated attempts were made to open negotiations. In the autumn of that year Villars' wound broke open, and he was obliged to resign for a time the command of the army. In 1711 the exhausted state of French finances hampered the military operations and kept Villars on the defensive within the frontier. In 1712 the battle of Denain (24th July), the capture of Marchiennes, Douai, and a number of forts by Villars, restored courage to the French. Prince Eugene was obliged to give ground, and retire beneath the walls of Brussels. The peace of Utrecht was concluded (separately) by Holland and England in 1713. Austria refused to sign the treaty; Villars was sent into Germany at the head of an army, and on the 7th of March 1714, the peace of Rastadt was concluded.

The military labours of Villars were now to experience a long intermission, and only to be renewed when he approached the termination of his career. From 1714 to 1732 he was exclusively engaged in the turmoil of state intrigue. He had set off to visit his government of Provence, when he was recalled to witness the last moments of Louis XIV. Villars stood on delicate ground with the regent. In concluding the treaty of Rastadt he had made two secret stipulations: that the right of succession to the French throne, to the exclusion of the Duke of Orleans, should be reserved to Philip V. and his descendants. The regent was pacified however by Villars's producing the autograph commands of Louis XIV. to insist upon those conditions. Villars was appointed by the duke a member of his council, in which he steadily opposed every deviation from the policy of his old master. In particular he laboured to prevent the adoption of the coarse proposed by Dubois, under the name of the quadruple alliance. He opposed energetically the adoption of the financial schemes of Law. Dubois advised the regent to have Villars arrested, and attempted to implicate him in the conspiracy of Alberoni, but the maréchal, by serving the regent with the same entire devotion as he had served Louis XIV., gained his confidence, and the affection manifested to him by the young king was an additional protection. After the death of Dubois the regent reserved to himself the office of prime minister, and regulated his conduct in a great measure by the advice of Villars in military and foreign affairs. "The Duke of Bourbon, who succeeded the regent, showed no less confidence in him. His only rival was the Abbé Fleury. The marriage of Louis XV. with the daughter of the king of Poland appeared for a time to strengthen the influence of Villars, but the Abbé Fleury having determined the queen's power with the king, the maréchal was obliged to give way to the favorite. This continued till 1732, when the rupture with Austria on account of the Spanish possessions in Italy rendered the military services of Villars indispensable. In his eighty-first year he was sent to command in Italy with the rank of maréchal-général de la France, which had never been conferred on any one before him, except Turenne. In the campaigns of 1733 and 1734 he evinced all the ardour, activity, and contempt of danger which characterised his youth. The ingratitude of the king of Sardinia however decided Villars to solicit his recall early in the course of the second. His wish was granted. He was taken ill at Turin on his way to France, and died on the 17th of June 1734.

The predominant features of Villars's character were humanity, sincerity, quickness of apprehension, and promptitude without precipitancy in action. He was not free from the lax gallantry of his day, and is said, with or without cause, to have been extremely jealous of his wife. In advanced life he evinced a degree of avarice, contracted probably from the habits of economy forced upon him by the circumstances of his youth. He is among the most brilliant military characters of France, yet without that restless desire of show which detracts from the merits of so many of them. He was capable of deep, disinterested, and lasting attachment. His conduct in the war of the Cevennes will ever endear his memory to the lover of humanity and of religious liberty.

VILLEHARDOUIN, GEOFFROY DE, was born near Arcis-sur-Aube about 1167, and was descended from one of the most ancient and distinguished families of the Comté de Champagne. He was Maréchal of Champagne when, in 1199 his sovereign lord Thibault, Count of Champagne and of Brie, determined on joining the cause of the crusades, and Villehardouin was among the first chosen to accompany him. Previous to the departure of his lord he was sent as ambassador to Venice, to solicit the aid and co-operation of that Republic in their enterprise. He arrived at that city with five other deputies in the beginning of Lent, 1201, and met with an honourable reception from Henry Dandolo, the Doge. Admitted before the council of state, Villehardouin eloquently explained the motives of his mission, and the reasons which had induced the Count of Champagne to apply to the Venetians for assistance, in preference to other powers. "We have chosen you before all other nations in Europe," he said, "as being the most powerful, the most generous, and the most capable of seconding so glorious an enterprise. We have come to demand your assistance and the junction of your forces to ours, without which we can never expect to re-conquer Jerusalem; and, as we are resolved to undertake this conquest, we have been commanded not to leave this city till we have received a favourable answer to our request, leaving it to you to impose the conditions on which it is to be granted." To this energetic appeal were joined the tears and entreaties of the other deputies, who, in the holiness of their mission, forgot the shame of kneeling as supplicants before the haughty representatives of commercial power. Moved by their appeal, and the peculiarity of the case, which were likely to result from the transaction, an unanimous acclamation arose from the assembly of "Nous l'octroyons! Nous l'octroyons!" A treaty was concluded between the French deputies and the Republic, by which it was agreed, that the Venetians should furnish the vessels necessary for the transport of 4500 horsemen and 9000 squires and attendants, and also 20,000 foot soldiers, with nine months' provisions; that the vessels should be equipped and ready to sail in the month of June in the following year, and that their service should only count from the time that they left Venice. For these services the crusaders were to pay the Venetians the sum of 80,000 marks of silver, or, according to some accounts, 85,000. The payment of so exorbitant a sum, for that period, proves equally the generous zeal of the crusaders and the attentive regard of the Venetians to their interests. After the conclusion of this treaty, Villehardouin returned to France, where he found the Count Thibault dangerously ill. The death of Thibault, which occurred soon after, left the crusaders without a chief. The command of the expedition having been offered to the Duke of Burgundy, and afterwards to the Count of Bar, who both declined it, it was finally accepted by the Marquis of Montserrat, who appointed Venice as the place of general meeting.

The first exploit of the crusaders, after leaving Venice, was, at the solicitation of Alexis Comnenus, to re-establish on the throne of Constantinople the Emperor Isaac his father. The French having afterwards to complain of the conduct of Alexis, who had not ratified the stipulated conditions for the succour they had lent him, sent Villehardouin as their deputy to make the necessary remonstrances.

Villehardouin was present at the siege of Constantinople in 1204, when that city was taken by the Venetians and French, and to him history is indebted for a minute and graphic description of this remarkable siege. The services of Villehardouin were rewarded by the Emperor Baldwin, who bestowed on him the land placed on the throne, by his appointment to the important office of "Maréchal" of the province of Romania. His military skill and bravery also insured him the esteem of the Emperor Henry, the successor of Baldwin, to whom the Marquis of Montserrat had given his daughter in marriage; from him he received, as a fief, the city of Messinopolis, together with its dependencies. This valuable donation induced him to reside in Thessaly, where he died about the year 1213. While however enjoying the honours which his merit had acquired, he appears not to have been unmindful of the country of his birth; in 1207, he richly endowed the abbeys of Froisey and Troyes, to which his sisters and his two daughters belonged. The lustre of his name gave power and influence to his descendants, who for nearly two centuries ruled over the most important principalities of Greece.

It is chiefly as an historian that the name of Geoffroy De Villehardouin has become celebrated. To him we are principally indebted for the history of one of the most important periods in the wars of the crusades, from 1199 to 1207. His work is entitled 'L'Histoire de la Prise de Constantinople par les Français et les Vénitiens.' The author relates the events in which he was an active participator with modest simplicity and tolerable candour. His narration is remarkable for brevity and clearness, and generally bears the impress of truth. His talents as a negociator caused him frequently to be employed on missions of importance, and to be nominated the counsels of the army; he has thus been enabled to give a minute detail of several events, of which we might otherwise have remained ignorant. His history is rendered the more valuable from the fact, that it is probably the oldest historical record in the prose which the French language possesses. The first edition of it was published at Venice in 1573, the second in Paris in 1585: the most valuable is that by the learned Du Cange, "whose notes," says Mills, "are as valuable as his notes on the Alexiad." [BYZANTINE HISTORIANS.] The title of this edition of Du Cange, which is now not easily to be met with, is as follows:—'Histoire de l'Empire de Constantinople, devisées en deux parties, &c., écrite par Geoffroy De Ville-Hardouin, avec la suite de cette Histoire jusqu'en 1240, tirée du Manuscrit de Philippe Mouskez, &c., le tout avec Observations faites par Charles Dufresne, Sieur du Cange; Paris, de l'Imprimerie Royale, 1657, in fol.' In this edition the old text is accompanied with a modern French version. The history of Villehardouin is also to be found in vol. xxviii. of the 'Recueil des Historiens des Gaules et de la France' in fol., Paris, 1822: the text in this edition has been revised on three manuscripts, and to it is appended a glossary.

VILLEMAIN, ABEL-FRANÇOIS, peer of France and one of the most distinguished of French men of letters, was born in Paris on the 11th of June 1790, and educated at the Imperial Lyceum there, where his

Digitized by Google

reputation for talent was such that at the early age of nineteen (1810) he was appointed Professor of Rhetoric in the College Charlemagne. Here, besides gaining fame as an eloquent lecturer, he distinguished himself by two published essays, both of which were crowned by the Institute—an 'Eloge de Montaigne,' published in 1812, and a 'Discours sur les avantages et les inconvenients de la critique,' published in 1814. The approbation bestowed on these Essays was such, that the young professor was removed in 1816 to the University of Paris, first as assistant professor of Modern History, and afterwards, in the same year, as Professor of Eloquence. In that year, too, he published his 'Eloge de Montesquieu,' which was again crowned by the Institute. A work of far greater importance was his 'Histoire de Cromwell, d'après les mémoires du temps et les recueils parlementaires,' published in 1819, in two volumes. His ardent sympathy with the Greek struggle for independence. In 1829 M. Villemain published 'Funérailles de M. Ficard : Discours ;' and in 1830, the first portion of his well-known work entitled 'Cours de Littérature Française,' the remainder of which appeared in 1833. Just before the revolution of 1830, he had been chosen deputy for l'Eure; with Guizot and others he figured as a man of influence at the crisis; and was consequently an important personage in the new government of Louis-Philippe. He was made a peer of France in 1833, was one of the most eloquent of political orators of the period, and, after having acted as Vice-President of the Council of Education, became Minister of Public Instruction under Guizot. In 1833 he published 'Funérailles de M. le Baron Cuvier : Discours ;' in 1837 a collection of his miscellaneous writings under the title of 'Mélanges Historiques et Littéraires;' and in 1841 a Report entitled 'Tableau de l'état actuel de l'instruction primaire en France.' In 1845 he resigned the Ministry of Instruction, and during the rest of the reign of Louis Philippe the state of his health precluded much public activity. In 1847 he gave to the world a new edition of the 'Provincial Letters of Pascal,' with an introductory essay. Since the revolution of 1848, M. Villemain, like his friends Guizot and Cousin, has lived in retirement, waiting for a change of system rather than hoping for it, and attending to no other duties of a public kind than those of the perpetual secretaryship of the Academy which he held since 1834. In 1850 he published 'Souvenirs Contemporains d'Histoire et de Littérature.' He has since published 'Tableau de l'Eloquence Chrétienne au IVe. siècle,' 1856, and 'Choix d'études sur la littérature contemporaine,' 8vo, 1857; and he is engaged in translating Pindar into French. Among M. Villemain's works, besides those which we have enumerated, are several translations from the English, including one of Sheridan's comedy of 'The School for Scandal,' published in 1822. [See Supplement.]

VILLENEUVE. From the birth of Romée de Villeneuve, grand-seneschal of Provence in 1170, to the death of Vice-Admiral Villeneuve in 1806, there has almost always been some one of this name to lend it distinction in France.

Romée de Villeneuve (born 1170, died soon after 1250) deserves to be remembered in the history of France as one of the earliest statesmen who appears to have comprehended the importance of uniting all the Gallic provinces into one nation. The history of his early life is obscure and distorted by fables. Created constable of Provence by Berenger before 1238, he besieged and took Nice, which had revolted against the count. Villeneuve frequently chose that city his place of abode during his subsequent career, and conciliated its citizens by his wise and humane government. He fought bravely against the Pisans and Genoese, patronised the Troubadours in general, and punished some in particular who sinned against morality in their writings. On the 12th of July, 1238, Berenger nominated him in his will regent of Provence, and guardian of Beatrice, his fourth and unmarried daughter. On the death of Berenger, in 1245, Villeneuve assembled the nobility of Provence, and persuaded them to swear fealty to Beatrice. He next married his ward to Charles of Anjou, brother of St. Louis, who had, many years before, in a great measure through the instrumentality of Villeneuve, been married to Marguerite, her eldest sister. The regent procured the insertion of a clause in the marriage contract of Charles of Anjou, in virtue of which the territories of Provence, if Beatrice died without male issue, were to descend to the offspring of her sister Marguerite by St. Louis. The object of this arrangement was realised two centuries later by Palamède de Forbin. After this marriage Villeneuve appears to have withdrawn himself from public life. His name only appears again in the page of history in the mention of his will, by which he disposed of an enormous fortune for that age.

Elion, or Hélion, De Villeneuve (born in 1270, died in 1346), of the same family as the preceding, entered in early life the order of St. John of Jerusalem, and, in 1319, on the abdication of Foulques de Villaret, grand-master of Rhodes, was elected his successor. Before repairing to his seat of government, the new grand-master visited several courts to collect contributions for his Order, which was at that time deeply involved in debt. The division of the order into langues has been attributed to him, and is said to have been proposed at a chapter which he held at Montpellier soon after his election. His visits to the courts above noticed, and a severe attack of illness, prevented his reaching Rhodes before 1336; the remaining ten years of his life were exclusively devoted to the discharge of his official duties. In 1344 he in person besieged and took Smyrna.

Rosaline de Villeneuve (born 1263, died 1329), sister of the grand-master of Rhodes, was famous for her piety, her charity, and her ascetic exercises of devotion. In 1310 she was elected head of the order of Chartreux. She was canonised after her death; and some legendary writers have attributed in a great measure to her intercession the suppression of the heresy of the Albigeois.

Louis de Villeneuve, premier marquis de France, distinguished by the title 'Riche d'Honneur,' belonged to the same family. He was born about 1451. Charles VIII., whose chamberlain he was, intrusted Villeneuve with the command of the army destined for the conquest of Naples. When Louis XII. mounted the throne, he sent Villeneuve as his ambassador to the papal court. At Rome the Provençal ambassador received extraordinary honours; the Romans were charmed with his courtly and persuasive eloquence; and his popularity was the occasion of his being again employed on a mission to that court at the perilous crisis of 1500. Villeneuve was the intimate and esteemed friend of Bayard and Gaston de Foix. In 1505 Louis XII. erected the barony of Trans, hereditary in the family of Villeneuve, into a marquisate, the first instance of that title being conferred in France. The only son of Louis de Villeneuve fell at the king's side in the battle of Marignan, and the father, already enfeebled by wounds and years, died not long after of grief, in the month of July, 1516.

Charles-René de Villeneuve, Baron de Cargue, was born 30th of June, 1541, was a member of this illustrious family. He was in his youth page to François de Lorraine, duc de Guise. He entered the service of Claude of Savoy, and earned a high reputation for bravery in that prince's campaigns against the Huguenots. On the death of the duke of Savoy, Villeneuve remained attached to the Comte de Carces, his lieutenant and successor in the government of Provence. De Carces intrusted to Villeneuve the delicate mission of moving the king to countermand the orders for the massacre of St. Bartholomew. The representations were however successful in partially shaking the resolution of the king, who sent for him in the course of the night, and charged him with a message to De Carces, countermanding his previous orders for the massacre in Provence so far as concerned. Villeneuve started immediately, passed the messenger of death on his way, and reached Aix in time to save Provence from the massacre. The subsequent career of Villeneuve was as honourable as this its commencement. He served with distinction Henri III., Henri IV., and Louis XIII. He died on the 26th of July, 1615.

There have been several authors of the name of Villeneuve. Hugon de Villeneuve, an ancient French poet of some reputation, was a contemporary of Philippe Auguste. He was one of the earliest writers of the legends of the Twelve Peers. His principal work is 'Le Quatre Fils d'Aymon,' next to which perhaps ranks his 'Doolin de Mayence,' of which a prose translation into more modern French was published at Paris in 1501, with the title 'Fleur des Batailles.' Guillaume de Villeneuve, a French soldier, who served Charles VIII. in his Neapolitan campaigns, published in 1497 'Mémoires sur la Conquête de Naples.' It is the only narrative by an eye witness of the adventures of the French army and partisans from the departure of Charles till their final expulsion. Gabrielle Suzanne Barbot, Dame de Villeneuve (born about 1695; died in 1755), wife of Jacques Crebillon, and published many tales and romances. Only one has retained hold of the popular mind, and that in the form of an abridgment: it is the famous 'Beauty and the Beast.'

The reputation of the name of Villeneuve was well sustained during the wars of the French revolution by Pierre Charles Jean Baptiste Silvestre de Villeneuve, vice-admiral. He was born at Valensoles in Provence, on the 31st of December 1763. He entered the navy in his fifteenth year, and obtained the command of a vessel in 1793. In 1796 he was promoted to be commodore (capitaine de division), and a few months later to be rear-admiral (contre-amiral). He was appointed to command a division of the fleet destined for the invasion of Ireland; but contrary winds detained him in the Mediterranean, and rendered the expedition abortive. At Aboukir Villeneuve commanded the Guillaume Tell, and carried off his own vessel, with two other ships and two frigates, in safety after the defeat. In

Digitized by Google

1805 he was placed in command of a squadron, the main object of which was to withdraw the British fleet from the shores of Europe. With this view he sailed for the Antilles, where he did some mischief among the English traders, and attacked the Diamond. As soon as Villeneuve heard of the arrival of the English fleet at Barbadoes, his mission being accomplished, he reimbarked his troops, and set sail for Europe. On the 22nd of July 1805, he encountered, off Cape Finisterre, the English fleet under Sir Robert Calder. An engagement took place, which continued till nightfall. Next morning, neither the French nor the English admiral sought to renew the action, and for failing to do so both were reprimanded by their respective governments. This reprimand so chafed the spirit of Villeneuve, that, when he again put to sea, an instruction to his captains, issued on the 20th October 1805, contained the remarkable expression—"Every captain who is not in action (dans le feu) is not at his post: and a signal of recall will be a brand of dishonour to him." In the battle of Trafalgar, Villeneuve was taken prisoner after displaying throughout the fight the most perfect self-possession and high courage. He was carried to England, and detained there till the month of April 1806. On his arrival at Rennes, he wrote to the minister of marine that he was in France, and waiting the orders of the emperor in that town. This was on the 17th of April. Four days elapsed, and he had received no answer. Mindful of the rebuke he had received on a former occasion, this delay appears to have unsettled the mind of Villeneuve. On the 22nd of April he was found dead in his apartment by wounds inflicted by his own hand.

VILLERS, CHARLES FRANÇOIS DOMINIQUE DE, had, next to Madame de Staël-Holstein, the chief share in making German literature known to the French at a period when the French, clinging to old prejudices and intoxicated by recent victories, treated Germany with neglect and contempt. He was born on the 4th of November, either of 1767 or 1765 at Delohen, a small town in that part of Lorraine which is inhabited by Germans. His father was chief receiver of the taxes, and a royal counsellor; by his mother's side, a baroness de Launaguet, he is said to have been allied to the family Du Lys, which is descended from the brother of Jeanne d'Arc, the maid of Orleans. He received a military education at Metz, and as early as 1782 was appointed lieutenant in the artillery. His first literary essay was on magnetism, which was then the favourite science of the day. He lived alternately at Strasburg and Metz, and he filled up his leisure hours with studying history, ancient and modern literature, as well as Greek and Hebrew, which he had hitherto neglected. Excited, though not misled, by the Revolution, he wrote a witty political satire in verse, entitled 'Les Députés aux Etats Généraux;' and in 1791 he published his celebrated work 'De la Réformation de l'Europe,' which went to three editions in the course of one year, he laid down political principles which were very dangerous not only for those who published them, but even for those who received them. At a period when the bloody tyranny of the people began to be established in France, he had the courage to place on the title of a work on liberty the motto "Aliud est, aliud dicitur;" and in the face of the most fanatical democrats he said "that it was dangerous to preach liberty to the people, because they always confounded liberty with the desire of indulging their will in everything;" and "that the people in insurrection were the worst tyrants of all." No sooner had the Jacobins established their power, than they pursued Villers, who, after many perilous adventures, escaped to Germany, and settled at Holzminden on the Weser. Though acquainted with the German language, and the most unfavourable opinion of German literature, because he had never read any good book in the language, and he had all the prejudices against the Germans which were then prevalent in France. At Holzminden however he made the acquaintance of Dr. Brandis, known by his excellent works on medicine and philosophy, who became afterwards first physician to the king of Denmark. His intercourse with this learned medical man, and his friendship with Küstner, Spittler, Heeren, and Schlözer at Göttingen, where he stayed from 1794 to 1796, led Villers not only to abandon his prejudices against the Germans, but to become the most active and generous defender of the nation against his own countrymen, the French. His friendship with the learned daughter of Schlözer, Mrs. Dorothea von Rodde, upon whom the University of Gottingen had conferred the title of Doctor in Philosophy, exercised still greater influence over him. In 1797 he followed Mrs. Dr. von Rodde and her husband, to Lübeck. From this time he lived alternately at Lübeck and Eutin, then the residence of Voss, Count Stolberg, Jacobi, and other distinguished scholars, poets, and philosophers. His chief object was to produce between the French and Germans, by eradicating their national prejudices, and by translating several of the best German works into French, among which was Heeren's 'Essay on the Influence of the Crusades.' Reimarus persuaded him to write for the 'Spectateur du Nord,' one of the best newspapers of the time, which was published at Hamburg, and which in the course of one year received sixty leading articles from Villers. Hanover having been occupied by the French in 1803, he addressed a letter to the French officers, urging them to spare and respect the people. In 1804 he published his 'Essai sur l'Esprit et l'Influence de la Réformation de Luther,' a masterpiece, which was crowned by the Institut de France, and which was translated into English (by R. Lambert, London, 1805, and again, with a preface and notes by James Mill), German (thrice), Dutch, and Swedish. In 1806 Lübeck was taken by storm by the French, and Villers had to expose the brutality and immorality of the French troops in his 'Lettre à Madame la Comtesse Amay de Beauharnais sur Lübeck.' This pamphlet caused him much persecution, especially from Davout, in 1811. Although he attacked the policy of Napoleon I. on several occasions, and especially by his articles against the Continental System, Jérome Bonaparte, king of Westphalia, appointed him, in 1811, professor of philosophy (for the branches of literature and history) in the University of Göttingen. Jérome having ordered the abolition of this university, Villers, at the request of Heyne, Heeren, and John von Müller, represented to the king the consequences of this measure, and the king countermanded his order. Villers was esteemed and cherished both by Frenchmen and Germans, and the Germans looked on him as their trusty friend and protector. He had nevertheless many enemies, especially among those who could or would not lay aside their prejudices; and the frequent attacks which were made upon his character gradually ruined his health. After the House of Brunswick had been restored to the possession of Hanover in 1813, Villers was dismissed from his post: he received a pension of 3000 francs, but he was ordered to return to France. As he had committed no crime, he protested against this order, and it was discovered that he had been calumniated to the Prince Regent, afterwards George IV., who, at the request of Count Münster, augmented the pension of Villars to 4000 francs, and allowed him to live in Hanover; but he was not permitted to continue his lectures. He had just been invited to the University of Heidelberg, when he died of pneumonia, on the 26th of February 1815, with the reputation of having been one of the most enlightened men of his time, who had in a measure sacrificed himself for the good of others. Villers also wrote—'Philosophie de Kant, ou Principes Fondamentaux de la Philosophie Transcendentale;' 'Lettre à George Cuvier sur une Nouvelle Théorie du Cerveau par Gall;' 'Rapport sur l'Etat de la Littérature Ancienne et de l'Histoire en Allemagne;' 'Précis Historique de la Vie de Martin Luther, traduit du Latin de Melanchthon, avec des Notes,' &c. He had begun the Life of Luther, but death prevented him from finishing it. The authorities cited below contain a list of his works.

(*Biographie Universelle; Zeitgenossen*, vol. ii. (1818), pp. 55-78.)

VILLERS, G. [BUCKINGHAM, DUKES OF.]

VILLOISON, JEAN BAPTISTE GAZIOT D'ANSSE DE, one of the most eminent Greek scholars of modern times, was born at Corbeil-sur-Seine on the 5th of March 1750. Among the scholars to whose instruction he was principally indebted we may mention Le Beau and Capperonnier, but Villoison soon surpassed all his fellow-students, and his teachers also, in the extent of his studies of the works of ancient Greece with such perseverance, that at the age of fifteen he had read nearly all the Greek authors. He soon also gave evidence that his extensive reading was not superficial, for he was scarcely twenty-two years old when he published from a manuscript at St. Germain the first edition of Apollonius's Lexicon on the 'Iliad' and 'Odyssey,' together with the fragments of Philemon (Paris, 2 vols. fol. 1773, reprinted at Leipzig in the same year in 2 vols. 4to), with very valuable and learned Prolegomena and notes. Before the edition was printed, he submitted it to the Academy of Inscriptions, which elected him a member, although he had not yet attained the age at which this honour could be conferred upon him according to their rules. He was now looked upon not only in France, but in Europe also, as a profound scholar and learning, and he formed a literary correspondence with scholars of various parts of Europe. But he did not allow himself to be dazzled by the fame thus early acquired, nor to sink into inactivity; he pursued his studies with the same ardour as before; and in 1775 he published a new edition of the pastoral poem of Longus with the most learned commentary. His ambition however was rather to publish such ancient works as had not yet appeared, than to prepare editions of those authors which were already in print. The government being informed of this desire of Villoison, he was sent in 1778, at the expense of the state, to Venice, to search the library of St. Mark. Here he formed an intimate friendship with the Abbé Morelli, with whose assistance he discovered numerous rhetorical and grammatical works and fragments of works of that kind which had not yet been printed. These, together with some other similar works which he had before discovered at Paris, were published under the title 'Anecdota Græca e Regiis Parisiensi et e Veneta S. Marci Bibliothecæ deprompta,' Venice, 2 vols. 4to, 1781. Valuable as these anecdota are, their publication was too hurried, and it was afterwards discovered that Villoison had published some things as new, which had appeared in print long before his time. Another more important discovery which he made in the library of St. Mark, was a manuscript of Homer's Iliad, which probably belonged to the 10th century, and contained very ancient scholia (now known under the name of Scholia Veneta), and marginal notes which pointed out such verses as were supposititious, corrupt, or transposed. This valuable treasure, together with very learned prolegomena by Villoison, appeared at Venice, folio, 1788. It was perhaps appreciated by no one so well as by F. A. Wolf, whose theory of the Homeric poems is based in a great measure upon the information derived from this discovery. Several years before the printing of this work was completed he was invited by Amalia, Duchess of Saxe-Weimar, and her son Carl August, to pay them a

Digitized by Google

visit in Germany. Villeison accordingly left Venice and went to Weimar, where he spent about a year in searching the library of that capital. The results of his learned inquiries were published in his 'Epistolæ Vinarienses, in quibus multa Græcorum Scriptorum loca emendantur ope librorum Ducalis Bibliothecæ,' Zürich, 4to, 1783. The year after he edited at Strasburg a Greek translation of the Old Testament, which he had discovered at Venice, and had been made by a Jew in the 9th century of our era. In 1785 he accompanied the French ambassador at the court of Constantinople, Count Choiseul Gouffier, to Constantinople, and travelled about for three years in the islands of the Archipelago and the continent of Greece. His hopes of finding manuscripts of ancient authors not yet published were disappointed, but he made himself perfect master of the modern Greek language, and collected a vast quantity of materials which he intended to make a new and improved edition of Tournefort's travels, and partly to write a complete description of ancient and modern Greece. But the unhappy condition in which he found his country on his return prevented the realisation of these plans. Villeison withdrew to Orleans, and began to read through all the ancient authors in order to collect materials for his great work on Greece. After the storms of the Revolution had passed away, he returned with his literary treasures to Paris, and having lost the greater part of his property, he began a course of lectures on the Greek language, in which however he did not meet with much success. He was made a member of the National Institute of France, and Napoleon I. afterwards appointed him professor of ancient and modern Greek in the Collège de France, but he had scarcely entered upon this office when he was seized by an illness which terminated in his death on the 26th of April 1805. The 'Memoirs' of the Academy of Inscriptions contain several valuable papers by Villeison. The materials for his great work on Greece, in fifteen large quarto volumes, as well as his remarks on Tournefort and on Montfaucon's 'Palæographia Græca,' of which he likewise intended to publish a new edition, are in manuscript in the royal library of Paris.

Villeison was a man of prodigious learning: he possessed an extraordinary memory, and a quick and penetrating mind; but his thirst for knowledge was so great, that he scarcely allowed himself time to digest that which he had acquired, and all the defects of his works arise mere or less from this haste and want of reflection.

VINCE, SAMUEL, a distinguished mathematician, and Plumian Professor of Astronomy and Experimental Philosophy in the University of Cambridge. He took orders, and he was promoted to the archdeconry of Bedford. He died in December 1821.

Professor Vince was elected a Fellow of the Royal Society in 1786, having previously written a paper on friction, which was published in the 'Philosophical Transactions' for 1785. This paper, it is said, possesses considerable originality and merit, contains a description of many experiments made on that subject. In the 'Philosophical Transactions' for 1795 there is a paper by Vince, entitled 'Observations on the Theory of the Motion and Resistance of Fluids,' in which are described several experiments relating to the discharges of water through pipes inserted, in vertical positions, in the bottom of vessels. From these it is shewn that, when the pipes are less than one inch in length, the ratio between the quantities discharged from a simple orifice and from a pipe are not exactly to one another when the duplicate ratio of the depths, that is, of the distance from the upper surface of the water in the vessel to the orifice and to the lower extremity of the pipe; the results of the experiments are however found to agree better with the theory in proportion as the pipes are longer. Another paper by Vince, which is entitled 'Experiments on the Resistance of Bodies moving in Fluids,' was published in the volume of the 'Transactions' for 1798. These experiments were made with bodies at considerable distances below the surface; and it was found that when the body is a plane surface, and also when it is a hemisphere moving with the flat side foremost, the experimental resistances differed from the results of the general theory in the ratio of 3 to 2 nearly. The ratio between the resistance experienced by a plane surface at rest, when struck by a fluid in motion, and that which took place when the same plane was made to move in the fluid, the latter being at rest, was found to be nearly as 6 to 5; and this result agrees with that which was obtained by Du Buat.

In conjunction with the Rev. James Wood, Professor Vince published at Cambridge a 'Course of Mathematics and Natural Philosophy, for the Use of Students in the University;' and of this valuable work there have since been several editions with considerable improvements: the parts written by Vince are entitled 'Elements of Conic Sections, intended as Preparatives for the reading of Newton's Principia' 'Principles of Fluxions;' 'Principles of Hydrostatics;' and 'Elements of Astronomy.' In 1790 came out his 'Treatise of Practical Astronomy,' in 4to, containing descriptions of the constructions and the uses of astronomical instruments; but his principal work is a 'Complete System of Astronomy,' which was published at Cambridge in 3 vols. 4to. (1797 to 1808). The first volume contains accounts of the phenomena and motions of the moon and planets, deduced from observations: part of the second is occupied with the subject of physical astronomy, or investigations from the theory of general attraction, concerning the precession of the equinoxes, the movements of the moon and planets, of the apsides and nodes of the orbits, and the variations to which the inclinations of the orbits are subject: the remainder consists of several tables, of great utility in the solution of problems relating to practical astronomy. The third volume contains a complete series of astronomical tables with precepts for their use; they consist of Delambre's tables of the sun, moon, and planets, and of the satellites of Jupiter, and Burg's tables of the moon; the epochs being changed to the first day of January at Greenwich mean noon.

Professor Vince published a pamphlet entitled 'The Credibility of Christianity Vindicated,' in answer to Hume's objections in his 'Essay on Miracles;' and, in 1806, one entitled 'Observations on the Hypotheses which have been assumed to account for the Cause of Gravitation on Mechanical Principles.' The latter was read before the Royal Society, and was intended to be the Bakerian Lecture in that parish. The narrow means of his family promised him a life of laborious toil, and till the age of twelve he assisted his parents in the care of their farm. He had however from early youth manifested so great an acuteness of intellect and sensibility of disposition, that they were induced to endeavour to give him a suitable education. He was placed as a student in a convent of the Cordeliers at Acqs, the residence of the bishop of his diocese. At the age of sixteen, he was considered qualified to become tuter to the children of M. de Commet, an advocate of Acqs, and the seigniorus of his native village. This situation enabled him at the same time to relieve his parents from the expenses attendant on his education, and to prepare himself for the ministry of the church, to which he had now determined upon devoting himself. He assumed the tonsure on the 20th of December 1596, and in the next year he went to Toulouse, in order to obtain the degree of theology of that university. But he was compelled, on account of the bleeder pittance which was allowed him, to combine the duties of a teacher with those of a student. In the year 1600, after having received the four previous orders, he was made a priest by the Bishop of Perigueux; in the same year the offer was made him of the parish of Tith, one of the most valuable in the diocese of Acqs, which he declined in order to devote himself more entirely to the study of theology. In this study, notwithstanding the difficulties under which he laboured, he soon became eminent, and on the 12th of October, 1604, obtained the degree of bachelier des lettres, with a permission to lecture.

In 1605, a legacy of fifteen hundred livres, which had been left him by a friend who had died at Marseille, compelled him to make a journey to that city. After taking possession of his legacy, he was returning by sea, when he was taken prisoner by some Tuoisian corsairs, and was wounded in the conflict. He has left us a minute relation of his capture and imprisonment, in a letter written to his early patron, M. de Comet, on his return to France in 1607, of which there is a copiene extract in the 'Biographie Universelle.' During his captivity at Tuels and Algiers, he became the slave of three successive masters; the last of them, an Italian renegade, he converted to his former faith. After a delay of ten months, he was mirtely fortunate to induce his master to forego the temporal advantages of a residence in a land where he was obliged to conceal his profession of Christianity, and to escape with him to France, in which country they landed on the 28th of June 1607. At Avignon, the penitent renegade was publicly reaulnited to the privileges and consolations of the religion he had denied. Shortly afterwards the vice-legate of the pope, Paul V., who had performed this ceremony, induced Vincent and his companion to accompany him to Rome. He there became acquainted with the ambassador of the French king, who selected him to be the bearer of an important and confidential message to Henry IV. He arrived in Paris at the commencement of the year 1609, and obtained several interviews with the king. His time however he chiefly devoted to the service of the sick of l'Hôpital de la Charité, near which he had taken up his residence.

The period of Vincent's residence in Paris was embittered by an accusation of robbery made against him by a fellow-lodger, a native of the same province as himself, and for six years he was unable to clear himself of the charge. During that time, though suffering severely from the cruel imputation, he contented himself, when questioned concerning it, with a simple denial, joined to the remark that "God

Digitized by Google

knew the truth." The real author of the robbery was at length discovered, and the reputation of Vincent rose still higher in the estimation of those who had witnessed the patience and resignation which he had displayed under the false accusation. His adversity however was alleviated by the sympathy and support of several influential personages, whose friendship and esteem his merit had conciliated. Among these was Margaret of Valois, sister of Henry III., and the divorced queen of his successor, who appointed him her almoner, and Pierre de Berulle, afterwards cardinal, and founder of the congregation of the Oratoire. By the latter he was induced to accept the cure of the parish of Clichy in the neighbourhood of Paris, where he discharged his duties with exemplary diligence. His short residence in that village was attended with the happiest results; not only were the sick attended to, the poor assisted, and the afflicted consoled, but family discords and dissent in religious matters were made by his pious influence to cease.

In 1613, he was obliged to abandon this peaceful scene of spiritual labour, to undertake the education of the three sons of Philippe Emmanuel de Gondi, count of Joigny, and general of the galleys of France. These pupils of Vincent were destined to occupy an important position in the history of their country; one of them became the well known Duc de Retz; another, the famous cardinal, who acted so conspicuous a part in the civil wars of the Fronde. [RETZ, CARDINAL DE.]

In 1616, he accompanied the Countess de Joigny to her country residence at Folleville, in the diocese of Amiens, where he commenced a series of eminently successful missionary labours among the inhabitants. The memory of this mission he was in the habit every year, on the festival of the conversion of Paul, of celebrating with great gratitude. The following year, he left the residence of the Count de Joigny to undertake the cure of the parish of Châtillon, in Bresse, where his labours were attended with similar success. It was there that he first established and organised a religious association for the relief of the temporal and spiritual wants of the sick and poor, to which he gave the name of the "confrérie de charité," which became the model of many similar institutions in France and other countries. Towards the end of the same year, he was induced to return to the county family, and, with the assistance and co-operation of the countess, a lady of pious disposition and intelligent mind, who had placed herself under his spiritual direction, he undertook several successful missions in the dioceses of Beauvais, Soissons, and Sens. An opportunity was now afforded him to labour in a cause still more important, and which presented its prospect of much difficulty, disappointment, and difficulty. He was in the habit of accompanying to Marseille the Count de Joigny, whose situation as commander of the royal galleys rendered it necessary for him frequently to visit that city. He was there met with commiseration on witnessing the cruelties and severities to which were subjected the unhappy criminals condemned to the galleys. To ameliorate their condition and to alleviate their sufferings was the task which Vincent took upon himself. He found them in narrow and unhealthy dungeons, almost entirely deprived of air and light, with bread and water as their only food: disfigured by filth, and covered with vermin, these wretched victims of their own misdeeds, and of the misguided policy of the state, sank shortly after their admission into a brutal state of ignorance and ferocity. Vincent began his work of reformation by introducing himself among them as their friend and benefactor, and undeterred by the rude scoffs and jests to which he was at first exposed, and undismayed by the havocks of a pestilential disease, which was habitual in these prisons, he unremittingly pursued his charitable mission; his kindly manner, his patient attention to their wants, his reproofs, tempered by mildness and Christian charity, and above all, his own example of humility and self-devotion, soon over came all obstacles; he gained their confidence, and thus secured a ready acquiescence in his efforts for their welfare. In a short time, the most unexpected success attended the improvements which he introduced and the reformation which he effected. The ameliorated condition of these criminals was sensibly felt and gratefully acknowledged by his patron, who called the attention of the king, Louis XIII., to the change which had taken place among the criminals under his care, and to the devoted man by whom it had been produced, and the king, with appropriate consideration for the services he had rendered, appointed Vincent almoner-general of the galleys of France; the date of his appointment to this important office was 6th of February 1619. In the beginning of the following year, Francis de Sales, the celebrated bishop of Geneva, whose intimacy he had for some time previously enjoyed, confided to him the direction of the first convent of the order of the Visitation, which he had lately established. [SALES, DE, FRANCIS, SAINT.]

In 1623, Vincent established two "confréries de charité" in the town of Macon, one for men, and the other for women. He next visited the city of Bordeaux, for the purpose of inquiring into the condition of the criminals there condemned to the galleys. On leaving that city, he visited his friends and relations in his native village; having assembled together those who remained of his family, he informed them of his determination to die as he had lived, destitute of all worldly wealth; told them that money left by a priest to his family seldom prospered, and thus weaned them from any expectation they might have formed of obtaining property at his death. This resolution however did not prevent him, on a subsequent occasion, from distributing among them about a hundred pounds of our money, which had been bequeathed to him.

The next scene of Vincent's labour was the town of Chartres, where he founded an association under the name of the "Congregation of the Missions," which was intended to supply the provinces of France with efficient teachers of religion, who were to act as assistants to the regular clergy, and were to be subordinate to the authorities of the church. On the 6th of March 1624, the "Collége des Bons Enfans" was given to him as the first residence of the new company he had formed. For the better watching of his infant institution, he left the family of the Count de Joigny, and retired to this college. In 1627, he had the satisfaction to see the Congregation of the Missions authorised by letters patent from the king, and in 1631, formally approved by a bull of the Pope Urban VIII. During this period he was actively employed in establishing retreats for the members of the society, and for persons destined to enter the orders of the church; a measure which greatly tended to the reformation of many existing abuses. In 1632, he yielded to the repeated requests of the prior of St. Lazarus, Adrien Lebon, to accept his house and property for the purpose of furthering his projects for the instruction and relief of the poorer classes of the peasantry. Small as were the beginnings of this institution, he lived to see the order of the Lazarists spread its charitable influence over the greater part of Europe. The institution however which has probably been productive of the most beneficial consequences was that which he established in 1634; it was composed of a company of pious females, called Sisters of Charity, who especially devoted themselves to the attendance on the sick; a branch of this society, called "les Dames de la Croix," was intended for the sole service of l'Hôtel Dieu at Paris. To Vincent de Paul this city indeed has been peculiarly indebted for many valuable and still existing institutions. Among them may be mentioned the hospitals of 'La Pitié,' 'Bicêtre,' 'La Salpêtrière,' and 'Les Enfans Trouvés,' or Foundling Hospital. The origin of this last-mentioned institution exhibits a striking proof of the disinterested zeal of Vincent. Previous to the establishment of the Foundling Hospital in Paris, an immense number of children, the fruits of licentious debauchery or the victims of their parents' poverty, were daily exposed in the streets and public places of that city, and often left there to perish. The pitiable condition of these innocent sufferers excited the commiseration and stimulated the charitable zeal of this devoted minister of the church. For the purpose of affording them food and support, he assembled in his cause several ladies of the capital, over whom his simple piety had already exercised a beneficial influence. He called them together at the commencement of the year 1640, and so energetically set before them the claims of the destitute infant upon the charitable intervention in favour of these unhappy foundlings, that they determined upon making the trial of taking under their protection all who should hereafter be discovered. The generous gift of an annual rent of 12,000 livres from the Queen Anne of Austria was the first assistance they received in their benevolent design. Soon however the wants of these foundlings exceeded the funds which charity could raise; discouraged in their efforts, and fearful that the task which they had undertaken was beyond their means and abilities, the adopted parents of these children were about to abandon their charitable enterprise. In a very short while, Vincent, in 1643, called together another and more numerous assembly, at which he pleaded the interests of these innocent outcasts of society in a language of fervid and impassioned eloquence. The termination of his address on that occasion has been recorded by a high authority as one of the finest pieces of eloquence in any language. (Maury, "Essai sur l'Eloquence de la Chaire.") [MAURY, J. S.] Rich and plentiful were the fruits of his energetic pleading; alms were collected in abundance, two large buildings were converted into hospitals for foundlings, and the capital of France was no longer disgraced by the daily exhibition in its streets of helpless children perishing from the want of food and succour. Besides the hospital already mentioned, Vincent founded two others, which have been productive of considerable benefit: one at Paris, which went under the designation of the house of *Incurables*, for the maintenance of forty poor men, a house for incapacitated from labour; the other, that of Sainte Reine, in the diocese of Autun, in Burgundy, for the relief of the poor and sick among the numerous pilgrims who are accustomed to visit the shrine of that martyr.

While occupied in the formation of societies and in the establishment of institutions destined for the permanent relief of his fellow-creatures, he was no less zealous and persevering in attending to the immediate wants of those who came within the reach of his assistance. The province of Lorraine was, during the latter period of the reign of Louis XIII., suffering under the threefold calamity of war, pestilence, and famine. To that province, by his charitable exertions, for several successive years, Vincent caused considerable sums of money, which he collected in Paris, to be sent for the succour of its inhabitants. His biographers differ with respect to the amount, the highest stated being two million livres, and the lowest from five to six hundred thousand.

During the wars of the Fronde, the Queen-regent, Anne of Austria, instituted a council for the settlement of disputes on questions of

Digitized by Google

theology, and appointed Vincent de Paul its president. In this capacity, he took an active part in the religious controversies of that period, and warmly espoused the cause of the Jesuits against the followers of Jansenius. Through his influence, a letter signed by eighty-eight bishops was sent to the reigning pontiff, praying him authoritatively to condemn the witness of Jansenius, and in particular the work entitled 'Augustinus.' In carrying on this controversy however he appears not to have exceeded the bounds of moderation, and to have employed against his adversaries only the legitimate weapons of argument and expostulation. The last four years of his life were spent under the burden of infirmities, which compelled him to keep within the precincts of the convent of St. Lazarus, where nevertheless he continued efficiently to preside over the interests of the community he had established. His death, which occurred on the 27th of September 1660, was preceded by severe and protracted sufferings, which were borne with his accustomed patience and resignation. His remains were deposited in the church of St. Lazarus, in presence of the assembled clergy and the highest dignitaries of the capital, who mourned his loss as that of their spiritual father; but perhaps the tears of most genuine affection were shed on his tomb by the multitude of the poor and needy, who gratefully remembered that they had often been consoled by his counsels and relieved by his charity.

The panegyric of this eminent minister of the church has been written by two of its most distinguished prelates, Boulogne, bishop of Troyes, and the Cardinal Maury; the last of these has been greatly admired for the beauty of its style and the energy of its expressions; it may be seen in the last edition of his 'Eloquence de la Chaire et du Chaire.' The memory of Vincent de Paul was consecrated by a ceremony, known in the church of Rome by the name of Beatification, by Benedict XIII., on the 14th of August 1729, and he was canonised as a saint on the 16th of June, 1737, by Clement XII., who appointed 19th July as the day of his festival in the Roman calendar.

The name of St. Vincent de Paul stands deservedly high in the list of benefactors of mankind. His entire life was devoted to the advancement of the best interests of humanity; he was a constant actor on the ever recurring scene of sickness and suffering, misery and crime, and his presence was always attended by consolation and relief to their victims. Men of all creeds and persuasions have rendered homage to his worth, and the members of his own church have ascribed to his relics the power of working miracles. The greatest miracle however was himself, and the mighty works of which he was the instrument: the many hospitals which he founded, the religious communities which he established, the missionaries whom he sent abroad, the vast sums of money which he caused to be distributed to the poor and sick, his untiring activity in ministering to their wants, his disinterestedness and self-devotion, his evangelical patience and religious resignation; above all, his genuine humility, which, while it shed lustre on those of his charitable deeds which are known, has caused a large proportion of them to be hidden and unwritten, even in the records of the book of life;—these, it must be allowed by all, are the real miracles on which stands the fame of this apostolical man.

The following is a list of the writings he has left:—1, 'Regule seu Constitutiones communes Congregationis Missionis,' Paris, 1658; 2, 'Lettre au Pape Alexandre VII., pour solliciter la Canonisation de François de Sales, prince-évêque de Genève;' 3, 'Conférences spirituelles pour l'Explication des Règles des Sœurs de la Charité,' Paris, 8vo, 1826.

The two most important biographies of St. Vincent de Paul are those of Abelly ('Vie de St. Vincent de Paul,' Paris, 2 vols. 8vo, 1839), who was intimately acquainted with him, and Collet (which has been translated from the French by a Roman Catholic clergyman, Dublin, 1840), who was a member of his community; there is also a third, by M. de Castigeon, Paris, 8vo, 1827.

VINCENT, WILLIAM, D.D., was born 2nd November, 1739, in the city of London, where his father carried on business, first as a packer, afterwards as a Portugal merchant, till he lost all he had through the failures that followed the Lisbon earthquake of 1755, in which also his second son perished. William, who was his third, was admitted a king's scholar of Westminster school in 1753, was thence elected a scholar of Trinity College, Cambridge, in 1757, and in 1761 took his degree of B.A., and was chosen a Fellow of his college. The next year he was appointed one of the ushers of Westminster school; in 1764 he took his degree of M.A.; and in 1771, having passed through the previous gradations, he rose to be second master of the school on the resignation of Dr. Lloyd. The same year he was also nominated one of the chaplains in ordinary to his majesty. Soon after this he married Miss Hannah Wyatt. In 1776 he took his degree of D.D. In 1778 he was presented by the Dean and Chapter of Westminster to the vicarage of Longdon in Worcestershire; but this living he resigned, after having held it about half a year, on being collated by the Archbishop of Canterbury to the united rectories of All-hallows the Great and Less, in Thames-street, London. At length, in 1788, on the death of Dr. Smith, Dr. Vincent succeeded him as head-master of Westminster School. This situation he continued to hold, discharging its duties with distinguished ability, till, on the translation of Bishop Horsley from the see of Rochester to that of St. Asaph in 1802, he was nominated by the crown the bishop's successor in the deanery of Westminster, having already been presented to a prebend in that church the year before. In 1803 the rectory of St. John's, Westminster, which is in the gift of the dean and chapter, having become vacant, and the nomination falling to his turn, he took that living for himself and resigned Allhallows, which however he obtained for his eldest son. Finally, in 1805, he exchanged St. John's for the rectory of Islip in Oxfordshire, the patronage of which also belongs to the church of Westminster. He died at his residence in Westminster, on the 21st of December 1815.

Dr. Vincent's first publication was an anonymous 'Letter to Dr. Richard Watson, Regius Professor of Divinity at Cambridge (afterwards Bishop of Llandaff), occasioned by his Sermon preached before the University,' 8vo, London, 1780. It was an attack upon certain political principles announced in Watson's last published sermon, and was followed by 'A Sermon preached at the Yearly Meeting of the Charity Children at St. Paul's,' 4to, 1784; 'Considerations on Parochial Music,' 8vo, 1787; 'A Sermon preached at the Anniversary Meeting of the Sons of the Clergy,' 4to, 1789; and 'A Sermon preached at St. Margaret's, Westminster, for the Grey-coat School of the Parish,' 8vo, 1792. This last discourse, which was another proclamation and defence of its author's strong conservative politics, was printed at the request of the Association against Republicans and Levellers, by whom, it is said, above twenty thousand copies of it were distributed. In 1793 Dr. Vincent published a short Latin tract entitled 'De Legione Manliana, Quæstio ex Livio desumpta,' &c., 4to. It is an explanation of what had appeared to be an irreconcilable difference between the account of the Roman legion given by Polybius (book vi., c. 1) and what is said by Livy (book viii., c. 8) about the manœuvre of the consul T. Manlius in his battle with the Latins at the foot of Mount Vesuvius, A.U. 413. His next publication, which appeared in 1794, was a tract in 8vo, entitled 'The Origination of the Greek Verb, so Hypothesis.' Singularly enough, in the same week in which this performance issued from the press in London, there appeared at Edinburgh a volume of a new edition of the 'Encyclopædia Britannica,' in which, in an article on Philology, was given a view of the origination of the inflections of the Greek verb almost identical with that proposed by Dr. Vincent. The author of the Edinburgh article was David Dalrymple, LL.D., a very remarkable man, then master of the grammar-school of Stirling, where he died at the age of eighty-one, in 1800. Vincent immediately sought out Doig, and although, we believe, they never met, they became friends through the medium of an epistolary correspondence. Vincent's speculation extended and put into a new shape, was reproduced the following year, 1795, under the title of 'The Greek Verb analysed, an Hypothesis.'

In 1797 appeared, in a quarto volume, the first of the works which have principally established Dr. Vincent's reputation, 'The Voyage of Nearchus to the Euphrates, collected from the original journal preserved by Arrian.' [NEARCHUS.] This was followed in 1800 by 'The Periplus of the Erythræan Sea, part first, containing an Account of the Navigation of the Antients from the Straits of Suez to the Coast of Zanguebar, with Dissertations.' The Second Part, containing the navigation from the Gulf of Ælana to the island of Ceylon, appeared in 1805; and both the Nearchus and Periplus were republished together, in two volumes quarto, in 1807, under the title of 'The History of the Commerce and Navigation of the Antients in the Indian Ocean.' A Supplemental volume, containing the Greek text of the two voyages, was afterwards added, with an English translation and also part of Arrian's Indian History. This work forms one of the most important contributions to ancient geography that modern scholarship has produced.

Dr. Vincent contributed several valuable articles to the 'Classical Journal,' and he was also a frequent writer in the 'British Critic' till near the close of his life. He printed, but did not publish, a letter in French, addressed to M. Bougainville, in 1800, and attacked his 'Nearchus.' His only other separate publications were, 'A Defence of Public Education, in a Letter to the Lord Bishop of Meath,' 8vo, 1802; and 'A Sermon preached before the House of Commons on the Day of General Thanksgiving for Peace,' 4to, the same year. The 'Defence of Public Education,' which he wrote and published immediately before terminating his connection with the Westminster School, was an answer to certain attacks recently made on the system of our public schools, which was charged with a neglect of religious instruction. One of the principal authors of the attack was Dr. O'Beirne, the prelate to whom Vincent addressed his 'Defence,' which passed rapidly through three editions. It is said to have been the only one of his publications from which he ever derived any pecuniary profit; he presented what he got from it to his wife as the first-fruits of his authorship. It was to this publication also that he was indebted for the deanery of Westminster, which was given him by Mr. Addington, then first lord of the treasury, avowedly as an expression of his admiration of the Defence of Public Schools. When Vincent republished his Nearchus and the Periplus, in 1809, he dedicated the work to his patron, then become Lord Sidmouth.

By his wife, who died in 1807, Dr. Vincent had two sons, the Rev. W. St. Andrew Vincent and George Giles Vincent, Esq. The history of his life has been given at ample length by his friend Archdeacon Nares, in a communication printed in the 26th and 27th Nos. of the 'Classical Journal.'

VINCI, LIONARDO DA, one of the most accomplished men of an accomplished age, and for the extent of his knowledge in the arts and sciences yet unrivalled, was born at the Castel da Vinci in the Val d'Arno below Florence, in 1452. His father Pietro da Vinci, of whom he was a natural son, was a notary, and in the year 1484 notary to the signory of Florence. He had three wives, but his son Lionardo was born before his first marriage, in his twenty-third year; the mother of Lionardo is not known. Lionardo evinced as a boy remarkably quick abilities for everything that he turned his attention to, but more particularly for arithmetic, music, and drawing; his drawings appeared to be something wonderful to his father, who showed them to Andrea Verrocchio. This celebrated artist was likewise surprised to see such productions from an uninstructed hand, and willingly took Lionardo as a pupil; but he was soon much more astonished when he perceived the rapid progress his pupil made; he felt his own inferiority, and when Lionardo painted an angel in a picture of the Baptism of Christ, so superior to the other figures, that it made the inferiority of Verrocchio apparent to all, he gave up painting from that time for ever. This picture is now in the academy of Florence. The first original picture of Lionardo's mentioned by Vasari, was the so-called Rotella del Fico, a round board of fig-tree, upon which his father requested him to paint something for one of his tenants. Lionardo, wishing to astonish his father determined to execute something extraordinary that should produce the effect of the head of Medusa; and having prepared the rotella and covered it with plaster, he collected almost every kind of reptile and composed from them a monster of most horrible appearance; it seemed alive, its eyes flashed fire, and it appeared to breathe destruction from its open mouth. It had the desired effect upon his father, who thought it so wonderful that he carried it immediately to a picture-dealer of Florence, sold it for a hundred ducats, and purchased for a trifle an ordinary piece, which he sent to his tenant. This curious production was afterwards sold to the duke of Milan for three hundred ducats.

Although Lionardo devoted himself enthusiastically to painting, he appears to have found time also to study many other arts and sciences—sculpture, architecture, engineering, and mechanics generally, botany, anatomy, mathematics, and astronomy; he was also a poet and an excellent extempore performer on the lyre. He was not only a student in these branches of knowledge, but a master. His acquirements cannot be better told than in his own words, in a letter to Ludovico il Moro, duke of Milan, when he offered him his services: —"Most illustrious Signor, having seen and sufficiently considered the specimens of all those who repute themselves inventors and makers of instruments of war, and found them nothing out of the common way: I am willing, without derogating from the merit of another, to explain to your excellency the secrets which I possess; and I hope at all opportunities to be enabled to give proofs of my efficiency in all the following matters, which I will now only briefly mention.

"1. I have means of making bridges extremely light and portable, both for the pursuit of or the retreat from an enemy; and others that shall be very strong and fire-proof, and easy to fix and take up again. And I have means to burn and destroy those of the enemy.

"2. In case of a siege, I can remove the water from the ditches; make scaling-ladders and all other necessary instruments for such an expedition.

"3. If through the height of the fortifications or the strength of the position of any place, it cannot be effectually bombarded, I have means of destroying any such fortress, provided it be not built upon stone.

"4. I can also make bombs most convenient and portable, which shall cause great confusion and loss to the enemy.

"5. I can arrive at any (place?) by means of excavations and crooked and narrow ways made without any noise, even where it is required to pass under ditches or a river.

"6. I can also construct covered waggons which shall be proof against any force, and entering into the midst of the enemy will break any number of men, and make way for the infantry to follow without hurt or impediment.

"7. I can also, if necessary, make bombs, mortars, or field-pieces of beautiful and useful shapes quite out of the common method.

"8. If bombs cannot be brought to bear, I can make crossbows, ballistae, and other most efficient instruments; indeed I can construct fit machines of offence for any emergency whatever.

"9. For naval operations also I can construct many instruments both of offence and defence: I can make vessels that shall be bomb-proof.

"10. In times of peace I think I can as well as any other make designs of buildings for public or for private purposes; I can also convey water from one place to another.

"I will also undertake any work in sculpture, in marble, in bronze, or in terra-cotta: likewise in painting I can do what can be done as well as any man, be he who he may.

"I can execute the bronze horses to be erected to the memory and glory of your illustrious father, and the renowned house of Sforza.

"And if some of the above things should appear to any one impracticable and impossible, I am prepared to make experiments in your park or in any other place in which it may please your Excellency, to whom I most humbly recommend myself," &c.

There is no date to this letter, but it was probably written about 1483, or perhaps earlier; it is written from right to left, as are all the manuscripts of Lionardo, and is in the Ambrosian Library at Milan. The duke took Lionardo into his service, with a salary of 500 scudi per annum. Why he chose to leave Florence is not known: he had made several propositions for the improvement of the city and the state, which were not listened to. This however may have had no such influence upon him as to make him leave Florence. One of his propositions was to convert the river Arno, from Florence to Pisa, into a canal.

Through Lionardo devoted more time to painting than to anything else, he did not make many designs before he went to Milan. The following are mentioned by Vasari: a cartoon of Adam and Eve, for the king of Portugal, to be worked in tapestry in Flanders; it was considered in its time to have been the best work that had ever been produced: a painting of the Madonna, in which there was a vase of flowers admirably painted; it was afterwards purchased at a great price by Pope Clement VII.: a design of Neptune, drawn in his car by sea-horses, surrounded by tritons and mermaids, with other accessories: and the head of an Angel, which was in the Palazzo Vecchio. Da Vinci's application was indefatigable; he sketched from memory striking faces that he saw in the streets; witnessed trials and executions for the sake of studying expression; invited people of the labouring class to sup with him, told them ridiculous stories, and drew their faces; some of these drawings were published by Clarke, in 1786, from drawings by Hollar, taken from the Portland Museum. He painted also before he went to Milan the Medusa's Head, now in the Florentine gallery. The silly story told by Vasari that the duke of Milan, invited Lionardo to go and play the lyre and sing to him, is an imputation on the common sense of the duke, that he could credit it, and an insult on the manly character of the painter that he could accept, such an invitation. Lionardo does not even mention music in his letter to Ludovico, although he was accounted the best performer on the lyre of his age. In Milan, besides performing many and various services for the duke, Lionardo established for him an academy of the arts about 1485, and formed a great school. His first public work in the arts was the model of a bronze equestrian statue of Francesco Sforza, mentioned in his letter. He painted also for Ludovico portraits of his two favourites, Cecilia Gallerani and Lucrezia Crivelli: there is a copy of the former in the Milanese gallery; the second is said to be in the Louvre at Paris (No. 1091).

When the duke went to meet Charles VIII. at Pavia in 1494, Lionardo was accompanied him, and had an opportunity of studying anatomy with the celebrated Marc Antonio della Torre, with whom he became on very friendly terms. Lionardo made many anatomical drawings in red chalk for Della Torre; and Dr. Hunter, who examined some of them in one of the royal collections in London, says in his Lectures, published in 1784, that they are most minutely correct. About the year 1495 Lionardo wrote a treatise upon the respective merits of painting and sculpture, and dedicated it to the duke, but it is now lost.

All the various works executed or written by Lionardo da Vinci cannot be mentioned in a short notice. The bare enumeration of the titles alone of his treatises, of which he wrote several at this period, would occupy much space. In 1496 he painted a picture of the Nativity, which Ludovico presented to the emperor Maximilian the same year, at Pavia; it is now in the gallery at Vienna.

In 1497 he commenced his celebrated painting of the Last Supper, on a wall of the refectory of the Dominican convent of the Madonna delle Grazie. This work, the greatest that had then appeared, was copied several times while it was in a good state, and it is well known from Frey's, Morghen's, and other numerous engravings of it. One of the best copies is that in the Royal Academy of London, made by Marco Oggione, purchased by Sir Thomas Lawrence in Italy: there are twelve old copies still extant. It was restored by Bellotti in 1726. Of the original nothing of the original work remained at the end of the last century, except the heads of three apostles, which were very faint: it was nearly destroyed about fifty years after it was painted; and some French soldiers in the time of the Revolution finished its destruction by amusing themselves with firing at the various heads in it. It was painted in some new manner in oil, and its rapid decay has been attributed to the imperfect or bad vehicles used by Lionardo. This was the last work of importance in painting which Lionardo executed in Milan. He was obliged to leave that place without having cast his great equestrian statue of Ludovico's father, Francesco Sforza: the mould was ready, and he was waiting only for the metal; but this Ludovico was not able to give him; he required 200,000 pounds of bronze. The affairs of the duke were in so bad a state that he could not even pay Lionardo his salary, which, in 1499, was two years in arrear; but he made him a present of a small freehold estate near the Porta Vercellina. After the duke's flight from Milan in that year, before Louis XII. of France, Lionardo had no longer any reason for staying there; but when he saw his works destroyed by the French, who broke up his model for the statue of Francesco Sforza, he left the place in disgust, and returned to Florence in the year 1500, accompanied by his favourite scholar and assistant, Salai, and his friend Luca Paciolo. He was well received by Pietro Soderini, the gonfaloniere, who had him enrolled in the list of employments by the government, and fixed an annual pension upon him. His first great work

Digitized by Google

was the cartoon of St. Anne, for the church of the Annunziata, a work which created an extraordinary sensation, but Lionardo never executed it in colours. He made also about the same time the celebrated portrait of the Madonna Lisa, the wife of Francesco del Giocondo, a work that has been praised perhaps more than it deserves; it is infinitely inferior in style and execution to his own portrait at Florence. Francis I. of France gave 4000 gold crowns for it, and it is now in the Louvre at Paris.

In 1502 he was appointed his architect and chief-engineer by Cesare Borgia, captain-general of the pope's army, and he visited in that year many parts of the Roman states in his official capacity; but in 1503, after the death of Pope Alexander VI., he was again in Florence, and was employed by Soderini to paint one end of the council-hall of the Palazzo Vecchio. Da Vinci selected for this purpose the battle in which the Milanese general, Nicolo Piciuino, was defeated by the Florentines at Anghiari, near Borgo San Sepulchro. This composition, of which Lionardi made only the cartoon of a part, was called the 'Battle of the Standard:' it represents a group of horsemen contending for a standard, with various accessories. Vasari praises the beauty and anatomical correctness of the horses, and the costume of the soldiers. Da Vinci is said to have left this work unfinished, on account of jealousy of the more successful and interesting design of the rival cartoon of the young Michel Angelo for the same piece. In 1507 Lionardo again visited Milan, and painted in that year, in an apartment in the palace of the Melzi at Vaprio, a large Madonna and Child, which is in part still extant. He painted about the same time also the portrait of the general of Louis XII. in Italy, Gianpiero Trivulzio, which is now in the Dresden Gallery. He visited it again in 1512, and painted two portraits of the young Duke Maximilian, the son of Ludovico il Moro. He again left it in 1514, with several of his companions, and set out, by Florence, for Rome, on the 24th of September of that year. He arrived at Rome in the train of the Duke Giuliano de' Medici, the brother of Leo X., by whom he was introduced to the pope. Leo at first took little notice of Lionardo, but upon seeing a picture of the Holy Family which he had painted for Baldassare Turini da Pescia, the pope's almoner, he gave him a commission to execute some works for him. Seeing however a great apparatus, and hearing that the painter was about to make varnishes, Leo said, "Dear me, this man will never do anything, for he begins to think of the finishing of his work before the commencement." This want of confidence in the pope, and the circumstance of his sending for Michel Angelo to Rome, offended Da Vinci, and he left Rome in disgust, and set out for Paris, to enter into the service of Francis I. of France, known to be a great patron of the arts, and to have a great esteem for Da Vinci's genius, whose works he possessed. Francis received him with the greatest kindness, and took him into his service, with an annual salary of 700 crowns. Da Vinci accompanied him to Bologna, where he went to meet Leo X., and afterwards, in the beginning of 1516, he went with him to France, whither, if it were possible, Francis treated him with still more attention. He also took with him the famous picture of the 'Last Supper,' but it could not be removed from the wall, upon which it was directly painted.

Da Vinci's health after he left Italy was so enfeebled that he executed little or nothing more. Francis could not prevail upon him to colour his cartoon of St. Anne, which he had brought with him; nor did he show himself at all disposed to commence any new work which would require the exertion of his energies. His health gradually grew worse, and he died at Clou, near Amboise, the 2nd of May, 1519, aged sixty-seven, not seventy-five, as Vasari and others after him have stated. Vasari relates, that he died in the arms of Francis I., who happened to be on a visit to him in his chamber when he was seized with a paroxysm which ended in his death. Amoretti, in his Life of Lionardo, has endeavoured to show this story of Vasari's to be fabulous, but the reasons he gives for his opinion do not in any way tend to prove it such. Lionardo's will and many other documents concerning him are still extant in the Ambrosian Library at Milan, where his manuscripts are likewise preserved. Lionardo was a man of proud disposition, of very sumptuous habits, and of a remarkably handsome person, which he always took great care to adorn with the most costly attire; in his youth also he was a great horseman. From the manner in which he always lived, his means must have been great, yet the rate of payment he received upon some occasions was very small, his salary when employed by the gonfaloniere Soderini was fifteen gold florins per month; but he was possessed of some property which he inherited from his family—from his father and an uncle; the estate also which was given to him by Ludovico il Moro, though small, may still have been of considerable benefit to him; he had likewise an estate at Fiesole. Half of the former he left to his servant Da Vilanis, and the other half, with the house, to Salhi, his favourite assistant; the latter to his brothers. His library manuscripts, his wardrobe at Clous, and all things relating to his art, he bequeathed to his scholar and executor, Francesco Melzi. The furniture of his house at Clou, near Amboise, he bequeathed to Da Vilanis.

This great painter had three different styles of execution. His first was much in the dry manner of Verrocchio, but with a greater roundness of form. His second was that style which particularly characterises what is termed the school of Da Vinci; it consists in an extreme softness of execution, combined with great roundness and depth of chiar'oscuro, together with a fulness of design: in this style are the works which he executed in Milan. His third differed little in essentials from his second, but was characterised by a greater freedom of execution and less formality of composition: of this style the best specimen is his own portrait in the Florentine gallery, a work equal in every respect to the finest portraits of Titian.

No man borrowed less from other men than Lionardo Da Vinci; he might almost be called the inventor of chiar'oscuro, in which, and in design, he was, in the earlier part of his career, without a rival. Both Fra Bartolomeo in his tone and mellowness, and Michel Angelo in his grandeur of design, were anticipated by Vinci. Previous to Fra Bartolomeo, Michel Angelo, and Raffaelle, with the exception perhaps of those of Masaccio, no works had appeared that could in any respect be compared with those of Da Vinci. Lionardo's works are not numerous; his occupations were too various to allow him to paint many pictures. There can be no doubt that many of the works attributed to him in various galleries are the productions of his scholars or imitators, as Bernardino Luino, Francesco Melzi, and Andrea Salhi, or Marco Oggioni. Gian Antonio Saltrabio, Cesare da Sesto, Pietro Ricci, Lorenzo Lotto, Niccolo Appiano, and others. The picture in the National Gallery, of Christ Disputing with the Doctors, is one of these doubtful works, or perhaps undoubtedly not the work of Lionardo.

Of Lionardo's numerous treatises few have been published. The best known is that on painting, 'Tratato della Pittura,' of which several editions have been published; it has been twice translated into English. In 1651 a very splendid edition was published at Paris by Raphael Trichet, with engravings from drawings by Nicolas Poussin. The work is divided into 365 short chapters, and contains such a mass of instruction that subsequent writers have had to do little more than reiterate in different words the precepts of Da Vinci. Lionardo's great object was scientific literary distinction himself, says Mr. Hallam, "from those short fragments of his unpublished writings that appeared not many years since, and which, according at least to our common estimate of the age in which he lived, are more like revelations of physical truths vouchsafed to a spirit of a higher than the common order, than any discoveries in any established basis. The discoveries which made Galileo, and Kepler, and Maveilin, and Maurolicus, and Castelli, and other names illustrious, the system of Copernicus, the very theories of recent geologers, are anticipated by Da Vinci within the compass of a few pages, not perhaps in the most precise language, or on the most conclusive reasoning, but so as to strike us with something like the awe of preternatural knowledge. In an age of so much dogmatism, he first laid down the grand principle of Bacon, that experiment and observation must be the guides in the investigation of nature. If any doubt could be harboured, not as to the right of Lionardo da Vinci to stand as the first name of the 15th century, which is beyond all doubt, but as to his originality in so many discoveries, which probably no one man, especially in such circumstances, has ever made, it must be on a supposition, not very unbreakable, that some parts of physical science had already attained a height which mere books do not record." The extracts alluded to above were published at Paris in 1797, by Venturi, in an essay entitled 'Essai sur les Ouvrages Physico-Mathématiques de Léonard da Vinci, avec des Fragmens tirés de ses Manuscrits apportés d'Italie.' These manuscripts were afterwards restored to Milan, where they are still preserved under the name of the 'Codice Atlantico.' It is said that Napoleon I. carried these and Petrarch's 'Virgil' to his hotel himself, not allowing any one to touch them, exclaiming with delight, "Quest sono miei" (these are mine). They were collected together by the Cavaliere Pompeo Leoni, who procured most of them from Mazzenta, who had them from the heirs of Francesco Melzi, to whom Lionardo bequeathed them. They came eventually into the hands of Count Galeazzo Arconauti, to whom James I. of England is said to have offered 3000 Spanish doubloons for them (nearly 10,000l.), but this patriotic nobleman refused the money, and presented them to the Ambrosian Library.

VINER, CHARLES, is known as the compiler of 'A General and Complete Abridgment of Law and Equity,' 24 vols. folio, 1741-51, and as the founder of the Viverian Professorship of Common Law in the University of Oxford. When or where he was born has not been recorded. The 'Abridgment' was printed at his own house, at Aldershott. The 24th volume is an Index, by a Gentleman of Lincoln's Inn. It appears to have occupied only ten years in printing, but Viner was probably occupied many years previously in preparation. Blackstone says he was half a century about it. This stupendous work was reprinted in 24 vols. roy. 8vo, 1792-94, and was followed by 6 supplemental volumes. roy. 8vo, 1799-1806, the compilers of which were James Edward Watson, Samuel Comyn, James Sedgwick, Henry Alcock, John Wyatt, James Humphreys, Alexander Anstruther, and Michael Nolan. Viner died on the 5th of June 1756, at his house, Aldershott, Hampshire.

Viner having resolved to dedicate the bulk of his property, as he himself states, "to the benefit of posterity and the perpetual service

Digitized by Google

of his country," bequeathed by his will, dated December 20, 1755, about 12,000*l.* to the chancellor, master, and scholars of the University of Oxford, to establish a professorship, and to endow such fellowships and scholarships of Common Law in the university as the produce of his legacy might be thought capable of supporting. The professor is to read a lecture in the English language within a year after his admission, and a course of lectures on the laws of England every year in full term. The course is to consist of at least twenty-four lectures, to be read in one and the same term, with such intervals that not more than four are to be read in a week. As relates to the reading of the lectures, Easter and Trinity terms are reckoned as one term. There are at present two fellowships with 50*l.* a year each, and six scholarships with 30*l.* a year each. Both fellowships and scholarships expire at the end of ten years after each election.

Blackstone was elected the first Vinerian professor. He had commenced his lectures on English law in the year 1753, two years before Viner made his will, and it is therefore probable that Blackstone's lectures gave Viner the hint for founding the professorship. The succession of professors is as follows:—1758, William Blackstone, D.C.L.; 1760, Richard Chambers, Kut., B.C.L.; 1777, Richard Wooddeson, D.C.L., author of 'Lectures on the Law of England,' 3 vols. 12mo; 1793, James Blackstone, B.C.L.; 1824, Philip Williams, B.C.L.; 1843, John Robert Kenyon, D.C.L.

VINET, ALEXANDRE-RODOLPHE, was born at Lausanne on the 17th of June 1797. His father, who held an official appointment in his native canton, a man of superior attainments, but a somewhat austere disciplinarian, was himself Alexandre's earliest instructor. While still a youth, his studies were chiefly directed to theology, he having been devoted to the service of the church; but then, as throughout life, literature possessed for him a predominant attraction, and so diligently had he laboured in this field, that at the age of twenty-one he was appointed professor of the French language and literature at the gymnasium of Basel. Two years later, 1819, he was ordained at Lausanne a minister of the protestant church, and the same year he married; but he continued to reside at Basel, where he, during the ensuing years, took an active and prominent part in the great religious movement or 'revival' which occurred amongst the Swiss protestant churches. Besides various pamphlets which he put forth in connection with this movement and with the proceedings of those who were opposed to it, he published in 1826 and 1827 his 'Mémoire à consulter de la Liberté des Cultes,' and he gradually came to be regarded as one of the leaders of the evangelical party.

M. Vinet remained at Basel till 1837 diligently fulfilling his scholastic duties as professor of French literature and eloquence, the latter chair having been created for him in 1835, and in 1829 he published, as a text-book for his class, his 'Chrestomathie Française,' a work of great taste and knowledge, which, in the later editions, consists of 3 volumes: 1, 'Littérature de l'Enfance,' 2, 'De l'Adolescence,' 3, 'De la Jeunesse et de l'Age Mûr,' and including a rapid but admirable survey of French literature. In 1831 the literary journal 'Semeur' was commenced, and for several years M. Vinet was one of its chief contributors; and in 1837 he published a selection of his essays contributed to it, with other miscellanies, under the title of 'Essais de Philosophie Morale.' In 1837 Vinet was invited by the authorities to take the chair of practical theology in the academy of his native city of Lausanne, and, with some regret at leaving Basel, he accepted the invitation. The religious discussions in the canton had decided the government to appoint a commission of the four classes of clergy to draw up a new constitution of the church, and M. Vinet was chosen a delegate for the class of Lausanne and Vévay. He took a part in all the protracted discussions which followed, but he could not bring himself to acquiesce in the decisions of the majority and, accordingly, upon the promulgation of the new constitution which was to come into operation in 1841, he, at the end of 1840, formally seceded from the national church, and resigned his professorship of theology. His opinions on this point the reader will find detailed in 'Mémoire en faveur de la Liberté des Cultes' in 1826, been approximating more and more closely towards 'voluntaryism,' and from this time he became a decided, and, among French Protestants, perhaps the most distinguished advocate of the entire separation of church and state. His matured views on this subject he gave to the world in 1842 in an 'Essai sur le manifestation des convictions religieuses, et sur la séparation de l'Eglise et de l'Etat, envisagée comme conséquence nécessaire et comme garantie du principe,' a work which was translated into English in 1843 under the title of 'An Essay on the Profession of Personal Religious Conviction, and upon the Separation of Church and State, considered with reference to the Fulfilment of that Duty.' But Vinet was far from being the harsh or bigoted advocate of extreme opinions. Whilst firmly adhering to his own views, he exhorted to a wide tolerance of the honest convictions of others, and his later years were spent in preaching peace and brotherly love, and seeking by the amenities of literature to soften the asperities of theological controversy.

His last labour was the elaboration of a constitution for the Free Church of the canton of Vaud, formed by the ministers who seceded from the establishment in 1845, and which he induced the committee appointed by the Church in 1846 to prepare the constitution, to adopt in its integrity. With the Synod however, in which the ultimate adoption of the constitution was vested, he was less successful, and the material alterations there introduced, are said to have preyed severely on his frame, already enfeebled by protracted ill-health. He continued however with increased diligence his professional duties and literary studies till his powers gave way: he died on the 10th of May 1847.

A list of the chief works, not already mentioned, of M. Vinet, will sufficiently indicate the character of his mind and the range of his pursuits. Among his theological works may be named his 'Discours sur quelques sujets religieux' (1831, of which a fourth edition appeared in 1845), and 'Nouveaux Discours,' &c. (1841), from which two works selections have been translated into English and published in America and Edinburgh under the title of 'Vital Christianity;' and his posthumous publications, 'Théologie pastorale, ou Manuelle-tique ou Théorie de la prédication,' of both of which English versions have appeared; 'Liberté religeuse et questions ecclésiastiques;' 'Etudes sur Blaise Pascal;' 'Etudes Evangéliques,' and 'Nouvelles études Evangéliques,' which have been rendered into English as 'Gospel Studies.' His two chief literary works are his 'Histoire de la littérature française au XVIIe siècle,' 2 vols., which appeared in an English version in 1854, and 'Etudes sur le littérature française du XIXe siècle,' 3 vols. 8vo: 1, 'De Staël et Chateaubriand;' 2, 'Poetes Lyriques et Dramatiques;' 3, 'Poètes et prosateurs.' All these works are accurate reflections of the mind and character of the author. Pure in sentiment, elegant and finished in style; clear, eloquent, brilliant rather than profound in thought; and everywhere pervaded by an earnest and conscientious spirit, they are works which will be read with pleasure and respect even by those who differ widely from their opinions. As a preacher, M. Vinet bore a high character for eloquence and earnestness; and as a teacher, he greatly increased the reputation of the schools of Basel and Lausanne, while his personal character was in every way admirable.

(E. Scherer, *Alexandre Vinet—Notice sur sa Vie et ses Ecrits*, Paris, 1853; and an excellent essay on the *Life and Writings of Vinet*, in No. 42 of the 'North British Review,' Aug. 1854.)

VIOTTI, GIOVANNI-BATTISTA, the first violinist of his time, was the son of the chief gardener to the Prince di Carignano, and born in 1753 at Fontaneto, a village in Piedmont. His father intended him for a line of life very different from that which his own inclination marked out; but, as usually happens in such cases, parental wishes were there combated by a natural propensity too strong to be resisted, and the youthful enthusiast was placed under the instruction of Pugnani, to whom all aspiring violinists looked up, and whose skill may be justly inferred from the celebrity which his pupil attained. At the early age of twenty he was selected to fill the situation of first violin in the royal chapel of Turin, on appointment of great professional rank, in which he remained three years; he then commenced his European travels, and made a lengthened visit to Berlin. He afterwards proceeded to Paris, where, by the grandeur and elegance of his performance, and the originality and beauty of his compositions, he speedily acquired a brilliant reputation.

In the early part of the French revolution, when it was deemed right that every class should be represented in the legislative body, Viotti was elected into the Constituent Assembly; but when the reign of terror commenced, he, disgusted and alarmed, fled to the English shores, and made a most successful début at one of Salomon's concerts. He afterwards took some share in the general management of the King's Theatre, but from this he soon retired; his genius fitted him better for the particular duty of leader of the band, in which office he superseded Mr. William Cramer. Viotti however did not long enjoy this appointment, for some unknown enemy, by false representations to government, caused his being ordered in 1798 to quit the country at a few hours' notice, and he retired to Hamburg, where he published his celebrated 'Six Duos Concertans pour deux Violons.' In 1801 he was allowed to return to London, and, finally abandoning his profession, embarked the whole of his small fortune in a partnership in the wine trade, by which unfortunate step he lost all. Until 1811 then offered him the direction of the Académie Royale de Musique, and he repaired to Paris; but he found himself as little qualified to direct the French opera as he had been to manage the Italian theatre in London; he therefore once more and finally settled in this country, meeting with an hospitable reception and an agreeable home in the house of a friend, where he mixed in the best society that the metropolis afforded. In such intercourse he did not refuse to contribute occasionally his talents to the general stock of enjoyment, and even consented to become an active member and director of the Philharmonic Society, when in its palmy state, and while it continued in its independent and disinterested form, appearing as a dilettante in its orchestra, occasionally as a principale, but more frequently as a repieno, and uniting with Salomon, F. Cramer, Yaniewicz, Spagnoletti, Vaccari, &c., to produce such a musical phalanx as never before was witnessed. His losses and disappointments however gradually affected his health, and he sank under them at Brighton on the 3rd of March 1824.

VIREY, JULIEN-JOSEPH, was born at Hortes, in the department of Haute Marne, in November 1775. He was educated at the College of Langres; on leaving which he spent some time with one of his uncles, who kept an apothecary's shop at Hortes. Here he imbibed that taste for medical researches and physical inquiries, which distinguished him through life. In 1793, he attached himself to the

Digitized by Google

republican armies stationed in the north of France, and having been received as one of the assistant dressers in the military hospital of Strasburg, he was noticed by Parmentier for his skill and handiness, and afterwards sent to the hospital, Val de Grace, at Paris, where he laid the foundation of his many writings.

In the early part of the century Virey became editor of the 'Journal de Pharmacie,' without relinquishing his functions at the hospital; he was already considered so fully master of medical subjects as to be consulted by the imperial government whenever any new medicament was to be introduced into France from other countries. Before he obtained his diploma as a physician and apothecary, he contributed without assistance more than half the fundamental articles to the two celebrated works, 'Le Dictionnaire des Sciences Naturelles,' and 'Le Dictionnaire des Sciences Médicales.' Among the vast number of useful works which issued from his pen the following deserve to be cited:—'Le Traité Théorique et pratique de pharmacie,' 2 vols. 8vo, the fourth edition was published in 1837; 'Ephémérides de la vie humaine,' a most original work, published in 1814; 'Histoire naturelle du genre humain,' 3 vols. 8vo; 'Histoire des mœurs des Animaux et de leurs instincts,' 2 vols. 8vo; 'Histoire naturelle de la Femme,' 1 vol. 8vo; 'Histoire des médicaments, des aliments et des poisons,' 1 vol. 8vo; 'De la Puissance vitale,' 1 vol. 8vo; 'Hygiène philosophique,' 2 vols. 8vo; 'Examen impartial de la médecine magnétique,' &c.

Besides his merit as a diligent inquirer after medical truth, the highest praise has been bestowed on Dr. Virey for the elegance, force, and animation of his style. His life was one of unbroken though moderate success. Devoted to labour, he always found ample without any very anxious employment; but this life, unruffled by a single care, was attended with one evil consequence—Dr. Virey became enormously fat; and at length he died very suddenly in his chair, whilst playing at whist with some friends, on the 29th of March 1840. He was an officer of the Legion of Honour, and a member of several learned academies.

VIRGILIUS POLYDORUS. [VERGILIUS POLYDORUS.]

VIRGI'LIUS, or VERGILIUS, PUBLIUS MARO, was born at Andes, a small place near Mantua, on the 15th of October, B.C. 70, in the first consulship of Cn. Pompeius Magnus and M. Licinius Crassus. He was five years older than Horace, who was born, B.C. 65, seven years older than the emperor Augustus. His father, who probably possessed a landed estate, had his son instructed at the neighbouring towns of Cremona and Mediolanum (Milan). According to Donatus, he stayed at Cremona till he assumed the toga virilis on the day on which he entered on his sixteenth year, in the second consulship of Cn. Pompeius Magnus and M. Licinius Crassus: this day, according to the same authority, was the day on which the poet Lucretius died. Virgil was taught Greek by the grammarian Parthenius, and philosophy by the Epicurean, Syron. It is apparent from the writings of Virgil that he had a learned education, and traces of Epicurean opinions are obvious in his poetry. When a division of lands in Italy was made among the veteran soldiers of Octavianus, Virgil lost his patrimony at Mantua (B.C. 41), but it was afterwards restored to him by Octavianus, through the intercession of some powerful friends, among whom are mentioned Alfenus Varus, Asinius Pollio, and Mæcenas. His first Eclogue is supposed to allude to the loss of his lands and his recovery of them. Virgil probably afterwards resided at Rome, and he was in favour with Mæcenas, who wished to pass for a patron of letters, and with the emperor Augustus. He preceded Horace in acquiring the patronage of Mæcenas; for Horace attributes his own introduction to Mæcenas to Virgil and Virgil's friend, Varius. Virgil also spent part of his time at Naples and Tarentum. In B.C. 19 he visited Greece, where he intended to spend several years, for the purpose of perfecting his epic poem, the 'Æneid.' It was on the occasion of this voyage that Horace addressed to him one of his lyric poems ('Carm.,' I. 3). At Athens Virgil met with Augustus, who was returning from the East, and he determined to accompany Augustus back to Rome; but he fell sick at Megara, which city he visited probably on his road to Rome, and his illness was increased by the voyage to Italy. He lived however to reach Brundisium, where he died on the 22nd of September, B.C. 19. According to his wish his body was taken to Naples, and interred on the Via Puteolana, at the second milestone from Naples. He is said to have written his own epitaph a short time before his death in the two following lines, which were placed on his tomb;—

> "Mantua me genuit; Calabri rapuere; tenet nunc
> Parthenope: cecini pascua, rura, duces."
>
> "My birthplace Mantua; in Calabria death
> O'ertook me; and in Naples now I lie.
> I've sung of shepherds, fields, and heroes' deeds."

The place of his burial is still pointed out by tradition, though the so-called tomb of Virgil at Posilipo has no pretensions to be considered as the monument of the Roman poet. He left as heredes the emperor Augustus and his friend Mæcenas, the poet Lucius Varius and Plotius Tucca. In person Virgil is said to have had a clownish appearance, and to have been very shy and diffident, and of feeble health. He was intimately acquainted with all the distinguished persons of his age, and his friend Horace has commemorated his virtues and gentle disposition.

The principal poetical works of Virgil are his 'Bucolica,' 'Georgics,' and his 'Æneid,' an epic poem. The 'Bucolica' are probably his earliest works: they consist of ten short poems, which have also received the name of Eclogæ, or Selections, a title which probably belongs to a later period than the age of the poet. The composition of these poems is assigned to the period between B.C. 41 and 37. The several poems were probably not written in the order in which they generally appear in the manuscripts and the editions; but critics are not agreed on the exact chronological order, nor indeed can it be ascertained. These poems are not strictly Bucolic in the sense in which the poems of Theocritus are called Bucolic. It has been justly observed that they are rather allegorical poems with a Bucolic colouring. So far as regards the versification these poems are of the highest order, and Virgil has the credit of attempting to introduce among the Romans a species of poetry with which they were unacquainted. But this is all his merit: his Bucolics are defective in construction, ill connected in the parts, they have no distinct object, and are consequently obscure. The obscurity is owing both to the subject and the manner of treating it. The circumstances of Italy and of Virgil's time did not present the same materials for Bucolic poetry which Theocritus had treated with so much graphic power. Virgil, having undertaken to imitate his Greek model, was obliged to keep to the form, though he could not impress his copy with the same character. Accordingly we have shepherds who sing in alternate verses, like those of Theocritus, and a Corydon, who complains of unrequited love; but we do not find the truth which pervades the pure Bucolic of Theocritus. Virgil must have felt the insipidity and unmeaningness of poems which affected to be descriptive, and yet had no realities to correspond to them. To introduce some variety he treats of subjects of present interest; and his own fortunes and the sufferings of his countrymen are supposed to be related in his first and ninth eclogues. But Virgil had a delicate subject to handle: it was necessary to be cautious in speaking of recent events, and he has consequently so constructed these poems, especially the first eclogue, as to throw over it a mist of obscurity which the commentators have never been able fully to dispense. The first eclogue is full of incongruities which render the interpretation most perplexing. All the other eclogues also abound in allusions to the circumstances and persons of his own time; but many of the allusions are as obscure as the particular responses of the Delphic Oracle. The first eclogue has not a single line which appropriately belongs to a Bucolic poem, nor indeed does the poet, as appears from the introductory verses, consider it as Bucolic in anything except the name. It is a perpetual enigma for the critics, and its solution still requires an Œdipus.

Virgil has borrowed numerous ideas from the Greek poets, especially from Theocritus, but we can hardly allow him the merit of judicious adaptation. His Bucolics, even when he attempts to approach nearest to the true character of Bucolic poetry, give no real picture of rustic manners. The reader never imagines that his shepherds are really singing, like those of Theocritus; and all poetic illusion is completely destroyed by the want of due attention to the proprieties of place and person, both of which, as already hinted at, were impracticable in the circumstances under which he wrote. Julius Cæsar Scaliger, after a comparison between Virgil and Theocritus, prefers the Roman poet; and a few scholars, who are inferior to Scaliger in learning, have put themselves on the same level with him in critical judgment.

The 'Georgics' of Virgil are a didactic poem, in four books, addressed to his patron Mæcenas. In these books he treats of the cultivation of the soil, in the second of the management of fruit-trees, in the third of cattle, and in the fourth of bees. His judgment and poetic taste were riper when he wrote the 'Georgics' than when he composed the Bucolics; and if he began the 'Georgics' as early as his Eclogues, it is clear that he must have revised and improved them at a later date. An argument from which we might conclude that the first book was written before B.C. 35, is mentioned by Clinton ('Fasti'); but the two facts on which his conclusion depends can hardly be relied on. If the concluding lines of the fourth book of the 'Georgics' are genuine, Virgil was finishing his poem at Naples about the year B.C. 30. Originality is no part of Virgil's merit, and the materials of this poem are all borrowed; but in the handling of his subject he has shown skill and taste. He has turned an unpromising subject into a pleasing and even an instructive poem, for the truth of many of his rules and precepts is confirmed by other writers, both Roman and modern. He has relieved the weariness inherent in didactic poetry by judicious ornament and occasional digression without ever wandering far from his subject. It has been said that the poem would have ended better with the third book, which properly closes the poem; and that the fourth, which treats of the management of bees, hardly belongs to the subject. There is some truth in this remark; and the fourth book has the appearance of being an afterthought, and not a part of the original design, though in the opening of the first book, as we now have it, the management of bees is announced as one of the subjects. The treatment of bees indeed seems hardly important enough for one book in four, and the poet has given it a proportional length by closing it with the story of Aristæus. If Virgil has erred in the choice of a poetic subject, he has at least redeemed his fault by the mode in which he has treated it, and his reputation must mainly rest on the 'Georgics.' He improved the structure of the hexameter verse as we find it in Lucretius; and

Digitized by Google

though he never attains the vigour of this writer, whom he had carefully studied, he has avoided that abruptness and harshness which often characterise the lines of Lucretius, and remind us of the antiquated verses of Ennius.

The Æneis of Virgil is the great national epic of the Romans. It is said that Virgil in his will gave instructions that the Æneid should be burnt, either because it was imperfect, or for some other reason which is not known; but that on Tucca and Varius urging to him that Augustus would not permit this, he bequeathed the work to them on the condition that they should add nothing, and leave the imperfect verses as they were. The Æneid was published by Tucca and Varius after Virgil's death, and was universally admired. The poem consists of twelve books, which contain the story of the wanderings of Æneas after the fall of Troy, and his final settlement in Latium after the defeat of Turnus and the Rutuli. The Homeric poems are the model of the Æneid; the merit of invention is entirely wanting. The first six books are an imitation of the 'Odyssey;' the last six books are founded on the 'Iliad.' Though the adventures of Æneas are the direct subject of the Æneid, the glories of Rome and the fortunes of the Julian House, to which Augustus belonged, are skilfully interwoven in the texture of the poem. The foundation of Alba Longa and the transfer of the seat of empire from that city to Rome, are announced in the first book of the Æneid, by Jupiter, to be the will of the Fates; and the great family of the Cæsars is declared to be the descendant of Æneas. The adventures of the Trojan hero at the court of Dido, queen of Carthage, give occasion to hint at the future rivalry between the Romans and the Carthaginians, and the long contest which was destined to end in the triumph of the descendants of the Trojan hero. The numerous allusions to actual circumstances and to the history of the republic were adapted to create or to confirm a popular notion of the Trojan descent of the Romans. Though the Æneid contains many fine passages, its poetical merits are greatly below those of the 'Iliad' and 'Odyssey.' The poem wants the unity of purpose and integrity of construction which so eminently characterise the 'Iliad,' and it is deficient in that truth and simplicity which form the never-tiring charm of both the 'Iliad' and the 'Odyssey.' The Trojan heroes of the Æneid are insipid personages; and the chief actor Æneas fails to excite our sympathy as much as his rival Turnus or the fierce Mezentius. But Virgil had other models besides Homer. The poets of the Alexandrine school were his study, and particularly Apollonius Rhodius, whom he has often imitated. It must be admitted that Virgil's subject was barren, and it required considerable skill to invest it with poetic interest. He accomplished this indirectly by giving to it an historical colouring and connecting the fortunes of Rome and of his great patron Augustus with the illustrious names of Troy. He scattered over his work an abundance of antiquarian lore, in which he was well skilled; and the great extent of his learning and his skilful adaptation of it to his purpose are conspicuous all through the work. Virgil was pre-eminently a learned poet; and if he had not originality and strong feeling, he had at least good taste. His poem can bear no comparison with the 'Iliad' as a complete work. It does not abide in the memory as an entire thing; yet numerous single passages are remembered with pleasure—a clear proof that its merits are to be estimated rather by an examination of the details than by the general effect; and consequently that it fails in satisfying the highest conditions of art, which require such a unity of parts as shall render them all subordinate to one general conception. The Æneid contains many obscure passages; and though Virgil is generally used for early instruction in schools, he is in fact one of the most difficult Roman writers.

The influence of Virgil on the literature of Rome might be the subject of a copious essay. His works were a text-book for the Roman youth and a model for the poets. Those who followed him as epic poets were certainly greatly inferior to him. There are indeed many fine passages in Lucan and Silius Italicus, but a love of rhetorical ornament always infected the literature of Rome, and in the later ages of the empire all good taste was sacrificed to it. Virgil was also the great classical poet of the middle ages. From the time of Charlemagne to the present day we may trace him in innumerable imitators and admirers.

Several short poems attributed to Virgil are printed in the collected editions of his works. 1, 'Culex, or the Gnat,' a kind of Bucolic poem, in 412 hexameters, which has little merit, and is probably founded on a genuine poem of the same name by Virgil. 2, 'Ciris, or the mythus of Nisus and Scylla.' This poem has been attributed to Cornelius Gallus and others. 3, 'Copa,' a short poem in elegiac verse, containing an invitation by a woman who is attached to a tavern, to persons to come in and drink at her merry there. Critics have assigned the authorship of this little poem to various persons. 4, 'Moretum,' in 123 verses, is probably a fragment of a larger poem which described the daily labours of a cultivator of the soil. This poem contains the description of the labours of the first part of the day only. The authorship of this poem is also uncertain. 5, 'Catalecta,' a collection of fourteen smaller poems.

The first edition of Virgil, which was printed about 1469, in small folio, has the following title: 'P. Virgilii Maronis Opera et Catalecta, Rome, Conr. Sweynheym et Arn. Pannartz,' with a dedication by Giovanni Andrea, bishop of Aleria in Corsica, to Pope Paul II. The text was printed from bad manuscripts. This edition is very rare: it was reprinted in 1471. Virgil was printed by Aldus at Venice, 8vo, in 1501; this edition also is very scarce. Virgil was often printed with the commentaries of Servius and others at the close of the 15th and the beginning of the 16th centuries. The edition of Robert Stephens, Paris, fol., 1532, contains the commentary of Servius. The edition of J. L. de la Cerda, which is valuable for the commentary, appeared at Madrid, in 3 vols. fol.: the several volumes were published in the years 1608, 1612, and 1617. The edition of Dan. Heinsius, appeared at Leyden, 12mo, in 1636; that of Nicholas Heinsius, which is much better, was first published at Amsterdam in 1676. The edition of C. G. Heyne, on which great labour was bestowed, was published from the year 1767 to 1775, at Leipsig, in 4 vols. 8vo, with a very copious commentary: this edition was reprinted in 1783 with the improvements. The fourth edition of Heyne, by G. P. E. Wagner, has the following title: 'Publius Virgilius Maro, Variorate Lectionis et Perpetua Adnotatione illustratus à Christ. Gottl. Heyne, Editio Quarta, curavit G. Phil. Eduard Wagner,' Lipsiæ, 5 vols. 8vo, 1830-42. The text has been corrected after the best manuscripts, the Medicean, Vatican, and others; the punctuation has been improved, and the orthography amended. The text may be had separately, in a single volume entitled the 'Publii Virgilii Maronis Carmina ad priscarum Orthographiarum quorundam fidem recensita, edidit Philippus Wagner,' Leipsig, 8vo, 1831. This volume also contains the 'Orthographia Vergiliana.' Of the edition of A. Forbiger, a 3rd edition appeared in 3 vols. 8vo, Leipsig, 1852.

The editions of the several parts of Virgil are very numerous. A tolerably complete list of all the editions and translations is given by Schweigger, 'Handbuch der Classischen Bibliographie,' vol. ii. pp. 1145-1258. There is a good German translation of the Bucolics by J. H. Voss with valuable notes: the second edition is by Abraham Voss, Altona, 1830. J. H. Voss also translated the Georgics: both the translation and the commentary of Voss are highly esteemed. Martyn's prose English translations of the Bucolics, London, 1749, and of the Georgics, 1741, are valued for the commentaries. A complete translation of Virgil by J. H. Voss appeared at Brunswick, in 3 vols. 8vo, 1799, and has gone through several editions. The Æneid was translated into Scottish verse by Gawin Douglas, Bishop of Dunkeld, and published at London in 1553. The English versions of Virgil are numerous. John Ogilby's translation into verse appeared at London in 1649 and 1650. The verse translation of Dryden was published by Tonson, London, 1697, with a 'hundred sculptures.' There is a translation in blank verse by Dr. Joseph Trapp. The latest version is that of Prof. John Conington, 1866. The Æneid by C. Pitt, and the Eclogues and Georgics by Joseph Warton, with observations by Spence and others, was published by Dodsley, 4 vols 8vo, London, 1763. The Georgics translated by Sotheby, with the original text and the versions of Delille, Voss, Soave, and Gurnan.

The materials for the life of Virgil are chiefly derived from the Life attributed to Tiberius Claudius Donatus, which, in its present form, is an uncritical performance, but has the appearance of being founded on good materials. It is printed in Wagner's Virgil with notes, and in some other editions also. The works already referred to, with Bashr's 'Geschichte der Römischen Literatur,' contain abundant references to the editions, translations, and commentaries on Virgil's poems.

VIRGINIA, a Roman maiden, daughter of L. Virginius, whose name is famous in the early history of Rome. Her story is one of the most beautiful in Roman history. She possessed extraordinary beauty, and had been virtuously brought up by her parents. She was betrothed to Icilius, a tribune of the people. Appius Claudius, one of the decemvirs, attempted to seduce her; but finding that her virtue was stronger than his temptations, he had recourse to fraud and violence. Her father Virginius was absent at Mount Algidus, where he commanded a division of the army against the Æqui. The decemvir thought this a favourable opportunity, and instigated M. Claudius, one of his clients, to claim the girl as his slave. Accordingly, one day when, accompanied by her nurse, she was going to the forum, where schools were then kept in the taberna, the client of Appius Claudius seized her, asserting that she was the daughter of one of his slaves, and consequently was his property. The nurse raised loud cries, and called on the people for help. A crowd came together, and the girl was rescued; but the claimant declared that he would establish his right before a court of justice. The case was accordingly brought before the tribunal of Appius Claudius himself, where the client stated that Virginia was the daughter of one of his slaves, and had been carried off into the house of Virginius, as he would prove by the evidence of Virginius himself; and he added, that until the return of Virginius she should be kept in the house of her lawful master. Great opposition was made by the friends of the girl to this claim, but Appius Claudius affected to think the demand of his client just. Icilius now stepped forward and claimed the girl as his betrothed wife; and when threats were unavailing, he implored Claudius to think of the consequences. Icilius was immediately surrounded by the lictors of the decemvir, and declared a disturber of the peace; but in order to have at least the appearance of justice on his side, Appius Claudius adjourned the case till the next day, adding that he would then enforce the law whether Virginius returned or not. Two messengers were speedily sent to Virginius to inform him of the danger of his daughter. Appius Claudius also sent a secret message to request

Digitized by Google

his colleagues in the camp to refuse Virginius leave of absence; but this message came too late, for Virginius had already left the camp. On the morning of the following day, when all the city was in anxious expectation, Virginius, accompanied by some matrons and numerous friends, led his daughter to the forum, entreating the protection of his fellow-citizens. Appius ascended the tribunal, and without listening to Virginius or Icilius, declared the girl to be the slave of his client, M. Claudius. When Claudius pressed through the crowd to seize Virginia, he was at first prevented by the multitude; but the threats of the decemvir overawed them, and his lictors made way for the client. Virginius, seeing the impossibility of saving his child, asked permission to have some conversation with her before their separation. This being granted, he took Virginia aside to a butcher's stall, and snatching up a knife, plunged it into her breast, saying, "This is the only way in which I can deliver thee," adding a curse on the head of Appius Claudius. The decemvir immediately ordered Virginius to be seized, but sword in hand he fought his way to the gate of the city. The friends of the unfortunate girl in the city roused the people to shake off the yoke of their haughty oppressors. Virginius in the camp appealed to the soldiers, and the power of the decemvirs was abolished.

(Livy, iii. 44-48; Dionysius Hal., xi. pp. 709, 718, 719, ed. Sylburg.)

VIRGINIUS. [VIRGINIA.]

VIRGINIUS RUFUS, a Roman rhetorician of the time of Nero, who sent him into exile, as Tacitus says, merely because he was a man of reputation. (Tacit., 'Annal.,' xv. 71; Dion Cass., lxii. 27.) He appears to be the same as the Virginius Flaccus, who is mentioned in the ancient 'Life of Persius,' and of whom this poet was a pupil. From Quintilian (iii. 1, § 21; compare iii. 6, § 44; iv. 1, § 23; vii. 4, § 24; xi. 3, § 126), who speaks of him as his contemporary, we learn that he wrote a work on rhetoric, which was more accurate than those of his predecessors; but no fragments of this work are extant. Some modern critics have supposed Virginius Rufus to be the author of the 'Rhetorica ad Herennium,' which is usually printed among the works of Cicero; but nothing certain can be said on the matter. (Schütz's Procemium to his edition of Cicero's 'Opera Rhetorica.')

VIRIATHUS or VIRIATUS (*Οὐιρίαθος*), the leader of the Lusitanians, in Hispania, in their war with the Romans, about the middle of the 2nd century B.C. He is first mentioned on the occasion when the Roman praetor Servius Galba treacherously massacred a large body of the Lusitanians (B.C. 150). Viriathus was one of the few who escaped. In the year B.C. 149, a Lusitanian army having been defeated by Caius Vetilius, the fugitives, who were blockaded, were on the point of surrendering, when Viriathus, who happened to be absent, reminded them of the treachery of Galba, and by a bold and skilful manœuvre released them, and was appointed their general. In a battle which took place shortly afterwards, he defeated and killed Vetilius. In the three following years he defeated successively the praetors C. Plautius, Claudius Unimanus, and C. Nigidius Figulus. The next year (B.C. 145) the Romans sent against him the consul Q. Fabius Maximus Æmilianus, who checked his successful course in this and the following year. In 143 Viriathus was again successful against the proprætor Q. Pompeius, whom he compelled to shut him self up in Numantia. In 142 the consul Q. Servilius Cæpio obtained the person of Viriathus by the treachery of some of that chieftain's intimate friends, and put him to death, after he had led the Lusitanians for eight years, or, as others say, fourteen, reckoning from the beginning of the Celtiberic war in B.C. 153.

The Roman writers say that Viriathus was first a shepherd and hunteman, then a leader of robbers, which they mean when a modern Spaniard would call a Guerilla chieftain; and at last a great commander, who, had fortune favoured him, would have founded an empire much greater than his native country, or, as Florus expresses it, would have been the Romulus of Spain.

(Appian, *De Reb. Hisp.*, 59-75; Livy, *Epit.*, lii., liv.; Diodorus Siculus, x., p. 72 & 0, 97; Valerius Maximus, vi. 4, § 2; ix. 6, § 4; Obsequens, 51, 52; Orosius, iv. 21; Florus, ii. 17; Eutropius, iv. 16.)

VISCHER, CORNELIUS, a celebrated Dutch engraver, born, probably at Haarlem, in 1616. He was the pupil of P. Soutman, but he soon surpassed his master. Visscher's works are among the finest specimens of art executed by the graver; Basan says that no master can be studied by young engravers with more advantage. He engraved prints of many descriptions, and some of his best are after his own designs. Watelet says that no man ever handled with the graver and etching needle together with such effect as Vischer. Strutt, speaking of his style of working with the graver, says, "His mode of performance with that instrument was as singular as the effect he produced was picturesque and beautiful. His strokes are clear and delicate, laid over the draperies and the back ground apparently just as the plate happened to lie before him, without any care or study which way they should turn, the one upon the other; and he crossed and recrossed them, till such time as they produced sufficient colour."

The few following are of the rarest and most valuable of his prints; good impressions of some of them have been sold for from fifteen to twenty pounds:—

Andreas Deconvroon Winkia, commonly called the Man with the Pistols; Gellius de Bourse, minister of Zutphen; a Cat sleeping upon a napkin: the Rat-catcher; the Pancake woman; and the Gipsy. Mariette possessed a collection of 172 of Visscher's prints, which was sold for 2666 francs 12 sous. His portraits are the best of the pieces which he engraved after other masters. The year of his death is not known, but it was probably 1653.

JOHAN VISCHER, brother of Cornelius, was likewise a good engraver and etcher, but, except in landscapes, inferior to his brother. He executed some good plates after Berghem and Ostade. He was born at Amsterdam in 1636; for in 1692, in his fifty-sixth year, says Houbraken, he turned animal-painter. He worked likewise with the needle and the graver, but more with the needle.

LAMBERT VISCHER was also a brother of Cornelius, but of inferior merit. He lived some time in Rome.

There was also a CLAUS or NICOLAUS JOHAN VISCHER, engraver and printseller, born at Amsterdam in 1580, who was probably of the same family. He excelled in small landscapes with figures; but he engraved also portraits; he engraved one of Charles I. of England; and published portraits of Archbishop Laud, Calvin, Erasmus, James II. of England, and the Duke of Monmouth.

(Houbraken, *Groote Schouburgh*, &c.; Basan, *Dictionnaire des Graveurs*; Strutt, *Dictionary of Engravers*; Huber and Rost, *Handbuch für Kunstliebhaber*, &c.)

VISCHER, PETER, a celebrated old German sculptor and founder, was born about the middle of the 15th century. He lived several years in Italy, where he studied his art. He first distinguished himself in Germany by his monument to the Archbishop Ernest of Magdeburg, erected in the cathedral of that place in 1497. But his master piece is the tomb of St. Sebald, in the church of that saint at Nurnberg, where Vischer ultimately settled. Vischer, with his five sons, Hieber, Hermann, Hans, Paul, and Jacob, who with their wives and children lived in the same house with him, was occupied over this monument from 1506 until 1519, yet he was paid only 2462 florins, which is at the rate of 20 florins per cwt.: the whole monument weighed 120 cwt. 14 lbs. It is beautifully designed and richly ornamented; among other figures there are twelve small statues, eighteen inches high, of the apostles, which are remarkably well drawn, and all conspicuous for their fine expression. In one part he has introduced his own portrait in his working dress. It is a monument, upon the whole, worthy of any time and any nation. Vischer executed some other clever works at Nurnberg: he died, according to Doppelmeyr, in 1590.

HERMANN VISCHER studied likewise in Italy, and was scarcely inferior to his father; he was killed in 1540 by a sledge, as he was going home one night with a friend. Sandrart says that the Prince or gentleman that visited Nürnberg left it without having seen and conversed with Vischer. He received many orders during these visits, and he sent many works into Bohemia, Poland, and other neighbouring countries.

(Sandrart, *Teutsche Academie*, &c.; Doppelmayr, *Nürnbergische Künstler*, &c.)

VISCONTI, the name of a family in Lombardy which rose to the rank of sovereign princes during the middle ages. The Visconti begin to figure in history about the middle of the 13th century. They belonged to the feudal nobility, and were possessed of considerable estates in the northern part of Lombardy, near the banks of the lake of Como and of the Lago Maggiore. In 1262 the archdeacon Ottone Visconti was nominated archbishop of Milan by Pope Urban IV. The see of Milan had been vacant ever since the death of Leone da Perego, in 1275, because the chapter was divided into two parties, one of which favoured a candidate from among the nobility, and the other gave its votes to a relative of Martino della Torre, the popular leader, who had been appointed 'anziano,' or 'elder,' of the people of Milan. The appointment of Ottone Visconti by the pope was considered an encroachment on the rights of the electors; and Martino della Torre sequestrated the property of the see, and forbade the archbishop elect from appearing in Milan. Upon this the pope excommunicated the city of Milan. But Martino della Torre and his successors Filippo and Napoleone della Torre continued to enjoy the popular favour, and Ottone Visconti remained an emigrant for fifteen years, during which he carried on, at the head of his feudal dependants, joined by malcontents from Milan and other towns, a desultory and predatory warfare against the Milanese. At last the popular feeling turned against Napoleone della Torre, who was suspected of aspiring to the sovereign power, especially after he had asked and obtained from Rudolf of Habsburg, the newly elected king of Germany, the dignity of imperial Vicar. Ottone Visconti seized this opportunity for striking a decisive blow. He put himself at the head of a large body of emigrant nobles, and advanced towards Milan. Napoleone della Torre and his adherents went out to meet him, and a combat ensued, in January 1277, near the village of Desio, in which the Torriani, as the partisans of Della Torre were called, were defeated with great slaughter, and Napoleone was taken prisoner. Ottone Visconti entered Milan amidst the acclamations of the people, who saluted him as archbishop and perpetual lord of Milan.

The Archbishop Ottone, after carrying on for years an almost uninterrupted warfare against the partisans of the Della Torre, gave up the temporal government to his nephew Matteo Visconti, whom he caused to be elected 'captain of the people' for five years, in 1288. Matteo was a prudent and temperate ruler, and he enjoyed general favour among the people. He defeated the Torriani and their ally the

Digitized by Google

Marquis of Monferrato, in an irruption which they made into the Milanese territory in 1290. After the expiration of the five years of his office, he was confirmed to it by the voice of the citizens, and in 1294 was appointed, by Adolf of Nassau, imperial vicar in Lombardy, which dignity was confirmed to him by Albert of Austria, who assumed the crown of Germany after the death of Adolf in 1298. In the year 1300 Matteo married his eldest son Galeazzo to Beatrice d'Este, sister of Azzo, lord of Modena and marquis of Ferrara. Matteo entrusted Galeazzo with the command of the militia of Milan, against the Della Torre and their partisans, who still kept the field, and were supported by the people of Pavia, Cremona, Lodi, and other towns, which were jealous of Milan. Galeazzo was very different from his father; he was young, inexperienced and rash: he was repeatedly defeated, and at last the Torriani re-entered Milan, in 1302, and Matteo Visconti withdrew to Novara near Verona, where he had a small property. His son Galeazzo took refuge at Ferrara.

Guido della Torre was put in the place of Matteo Visconti, as 'perpetual captain of the people,' and he continued in his office till 1311, when Henry of Luxemburg having gone to Italy to be crowned emperor, Guido opposed him, and was in consequence driven toward from Milan by the Imperial troops, assisted by the Visconti and their friends. From that time the Torriani remained exiles from their country. Matteo Visconti resumed his authority over Milan, being appointed imperial vicar by Henry, to whom he paid 40,000 golden florins. His son Galeazzo was likewise appointed imperial vicar of Piacenza. Some time after, Matteo, by a stratagem, obtained possession of Pavia, where he placed Luchino, another of his sons, as governor. Alessandria, Tortona, Cremona, Bergamo, Lodi, and other towns acknowledged in succession the rule of Visconti.

Cassano della Torre, who had been elected archbishop of Milan in 1308, having become an exile with the rest of his family, obtained of the pope his removal to the see of Aquileia. The see of Milan having thus become vacant, Matteo Visconti caused one of his sons, Giovanni, to be elected by the chapter according to the old canonical form. The pope, John XXII., refused to acknowledge the new archbishop, and he appointed Aicardo, a Franciscan friar. Matteo forbade Aicardo from going to Milan. The pope then ordered proceedings to be instituted against Matteo Visconti, on the charges of heresy, sacrilege, and other crimes, and summoned him to Avignon to defend himself. Robert of Anjou, king of Naples, was appointed by the pope imperial vicar in Lombardy; for the pope assumed the right of appointing vicars during the vacancy of the imperial crown, which was then contested between Louis of Bavaria and Frederic, duke of Austria. An army of Neapolitans, or Provençals, under the Count of Meine, crossed the Alps and marched against Milan. Matteo sent his son Galeazzo with a strong force to meet the enemy on the river Sesia, and he found means, by negociations and bribes, to induce the Count of Meine to retrace his steps into France without coming to blows. The pope however excommunicated Matteo and his sons in 1321, because he would not resign his authority and acknowledge King Robert as imperial vicar in Lombardy; and the inquisitors appointed by the pope summoned him to appear before them at a church near Milan. But Matteo sent in his place one of his sons, Marco, escorted by a body of troops with flying colours, at the sight of which the inquisitors withdrew to the town of Valenza in Mooferrato, whence they issued their sentence of condemnation against Matteo Visconti on twenty-five charges, several of which consisted in having laid taxes upon the clergy and exercised temporal jurisdiction over them; in having interceded for the abbess Mainfreda, who had been burnt for heresy at Milan, in the year 1300; in entertaining himself heretical opinions, and being imbued with diabolical charms. He was consequently declared as a confirmed heretic, degraded from all honours and offices, and stigmatised as perpetually infamous; all his property was declared to be confiscated, and his children and grandchildren were excluded from every honour, dignity, and office. This extraordinary sentence was given on the 14th of March 1322, in the church of Santa Maria of Valenza, and signed by Aicardo, archbishop of Milan, and four Dominican inquisitors, in presence of the cardinal legate, Bertrand du Polet, who afterwards proclaimed from the neighbouring town of Asti a plenary indulgence to all those who took up arms against Matteo Visconti and his adherents. Raynaldus, in his continuation of the Annals of Baronius, acknowledges that these violent proceedings against Visconti were instigated by party spirit; and Pope Benedict XII., in his bull of the 7th of May, 1341, denounced them as unjust and null.

At the time however Matteo's situation was very critical. His enemies took the part of the legate, and the people in general were horror-struck at the solemn denunciations against him. Matteo protested that he was no heretic, and that he was falsely accused; and having one day convoked the body of the clergy in the cathedral of Milan, he repeated loudly before them the creed, professing that he believed and had ever believed in the tenets therein expressed. But the feeling of his danger and humiliation preyed upon the old man's mind (he was then seventy-two years old), and he died after a short illness, in June of the same year, three months after the sentence was pronounced against him. All the chroniclers speak of him as a wise and just man, the founder of the fortunes of his family, and some have styled him 'the Great.' His son Galeazzo I. was proclaimed lord of Milan. Upon this the pope issued an interdict against the city of Milan, and ordered all the clergy to leave the place; and he proclaimed a general crusade against the Visconti family. Numbers answered the call; and the command of the crusaders was given to Raymond of Cardona, nephew of the cardinal-legate. In June 1323, the 'holy army,' as it was styled, approached Milan, and took possession of the suburbs, killing the men, violating the women, and burning the houses. But the Visconti had a strong party within the city, and they defended themselves until they received assistance from without. Marco Visconti, another son of Matteo, and a brave and enterprising captain, still kept the field, hovering on the flanks and rear of the crusaders. Louis of Bavaria, meantime having conquered and taken prisoner his rival Frederic of Austria, and being acknowledged king in Germany, sent a body of troops into Italy to assist the Visconti, who had incurred the wrath of the pope mainly because they had striven to maintain their delegated authority of imperial vicars against the assumptions of the pope, who would appoint his own vicars to the prejudice of the imperial authority. This was at least the ostensible ground which the Visconti took, and a plausible one it was, and very convenient to the interest of the empire in Italy. The aid of Louis of Bavaria and the exertions of Marco Visconti saved Milan. The crusaders withdrew to Monza. The pope, in July of that year, excommunicated Louis of Bavaria for having assumed the title of King of the Romans without the papal approbation, and also for having assisted the heretical Visconti. Louis then held a diet of the empire at Nürnberg, in which he protested against the interference of the popes in the temporal concerns of the empire, and appealed to a general council of the Church. In the year 1324 a battle took place at the village of Avrio on the Adda, between the papal or crusade troops and those of the Visconti, in which the former were defeated. Cardona was taken prisoner, and those who escaped shut themselves up in the town of Monza, which, after a siege of some months, surrendered to Galeazzo Visconti.

In 1327 Louis of Bavaria went to Italy, and was crowned at Milan with the iron crown of Lombardy, in May of that year. He also recognised Galeazzo Visconti as imperial vicar over Milan, Lodi, Pavia, and Vercelli. But a few days after, a quarrel—the grounds of which are not ascertained—broke out between Louis and Galeazzo, instigated, it would seem, by Marco Visconti, who was envious of his brother. About the same time, Stefano Visconti another son of Matteo, died suddenly. Galeazzo, his son Azzo, and his brothers Luchino and Giovanni, were arrested by order of Louis, and shut up in the dungeons of the castle of Monza. After eight months they were liberated, in March 1328, by the intercession of Castruccio Castracani, lord of Lucca, and a favorite of Louis of Bavaria. Galeazzo died soon after in exile, whilst Milan was temporarily governed by a council of twenty-four citizens. Louis of Bavaria was crowned emperor at Rome, in May 1328, by the antipope Nicholas V., whom he had set up in opposition to John XXII. The people of Rome, tired of the residence of the popes at Avignon, acknowledged Nicholas, and the people of Milan did the same. Louis of Bavaria, being at Rome, appointed Azzo, son of Galeazzo I., and nephew of the appointment of imperial vicar of Milan, in January 1329, for 60,000 golden florins; and the antipope Nicholas confirmed Giovanni Visconti, Azzo's uncle, as archbishop of Milan, made him a cardinal, and appointed him apostolic legate in Lombardy. John XXII., perceiving that he was in danger of losing all influence in Italy, came to terms with the Visconti through the mediation of the Marquis of Este, and recognised Azzo as lord of Milan, releasing him and the people of Milan from excommunication. This was in September 1329.

Azzo Visconti, being acknowledged lord by the council of the city of Milan, as well as by the pope, renounced all connection with Louis of Bavaria and the antipope Nicholas. He ruled Milan for eleven years, during which he applied himself chiefly to improve the town, rebuild its walls, and pave the streets; he restored and embellished the palace raised by his grandfather, Matteo, and prepared for the purpose the painter Giotto of Florence and the sculptor Giovanni Balducci of Pisa. Azzo Visconti was a good prince, and when he died, in August 1339, more than 3000 citizens voluntarily put on mourning for him. He was the first lord of Milan who coined coin in his own name, omitting that of the reigning emperor. He left no issue, and the council-general, after his death, proclaimed joint lords of Milan his two remaining uncles, Luchino and Giovanni Visconti. Giovanni however, being a clergyman and of a quiet character, left to his brother Luchino all the cares of government.

Luchino Visconti was an able, determined, and not very scrupulous man. To the several towns besides Milan which acknowledged the rule of his nephew Azzo, he added the towns of Asti, Bobbio, Parma, Crema, Tortona, Alessandria, and Novara, thus making himself lord of the greater part of Lombardy and Monferrato. He obliged also the Pisans to become tributaries to him. He established a regular police, and severely punished all offenders against the law, without distinction of party. He appointed a judge of appeals at Milan, who was styled 'Ragionatore,' who decided summarily. It was determined that this magistrate should be a foreigner, without relations or connections in Milan. In Luchino's time the manufacture of silks was established at Milan, and agriculture, and especially the cultivation of the vine, was improved, as well as the breed of horses and cattle.

Digitized by Google

Luchino however had vices which marred his good qualities: he was suspicious, lustful, and revengeful. He banished his three nephews, sons of Stefano Visconti, and let them wander abroad in poverty. He put to death Pusterla, a Milanese noble, and his wife Margherita, because she would not listen to his addresses. Isabella Fieschi, Luchino's wife, was in this respect a match for her husband, being notorious for her loose conduct. Luchino threatened to punish her, but he died suddenly, in January 1349, and it is hinted by contemporary chroniclers that he died of poison.

By the death of Luchino, the archbishop Giovanni Visconti remained sole lord of Milan. He was of a mild and quiet disposition: he made peace with his neighbours the Marquis of Monferrato, the Count of Savoy, and the Genoese; he recalled from exile his nephews Matteo, Barnabò, and Galeazzo, sons of Stefano Visconti, and he obtained the hand of Bianca of Savoy for Galeazzo, and that of Regina della Scala for Barnabò. He purchased of Giovanni Pepoli the dominion of Bologna, by the payment of 200,000 golden florins, lo 1350. Pope Clement VI. claimed the possession of Bologna as an old dependence of the Roman see, and as Giovanni refused to give it up, the pope excommunicated him, but soon after came to a compromise, by which Giovanni retained Bologna, with the title of 'Vicar of the Holy See.' Giovanni Visconti had been elected archbishop of Milan by the chapter, first in 1317, and again in 1339, after the death of the friar Aicardo, and in 1342 Clement VI. confirmed him in his see.

In 1353, the Genoese, having been defeated at sea near the coast of Sardinia by the Venetians, and their town being blockaded by the forces of the King of Aragon, who was allied with the Venetians, offered to the Archbishop Visconti the lordship of their city, stipulating for the maintenance of their municipal liberties. Visconti sent a garrison to protect the town, and in the following year a new fleet sailed from the harbour of Genoa bearing on its colours the arms of the Visconti. This fleet, commanded by Pagano Doria, obtained a complete victory over the Venetian fleet on the coast of the Morea. In the same year (October 1354) the Archbishop Giovanni Visconti died, leaving Milan in peace and in a prosperous condition. He was the last good ruler of this Visconti line; those who came after him were all bad, and some of them abominable. It was during the government of Giovanni Visconti that Petrarch repaired to Milan, where he was induced to remain by the archbishop, who paid him great respect.

After the archbishop's death, his three nephews, Matteo, Galeazzo, and Barnabò, conjointly succeeded him in the lordship of the town of Milan and its territory, but they divided among them the other towns which had become subject to the Visconti. Matteo had for his share the towns south of the Po, namely, Bologna, Parma, Reggio, and Bobbio, besides Lodi; Barnabò had the towns east of the Adda—Brescia, Bergamo, Crema, and Cremona; and Galeazzo took for himself Pavia, Asti, Alessandria, Tortona, Vercelli, Novara, Vigevano, and Como.

In January 1355, Charles IV. of Germany went to Italy to be crowned, and was received by the brothers Visconti with great magnificence, and he appointed them his imperial vicars in their respective dominions. In September of the same year Matteo Visconti died suddenly, and it was said of poison, plotted by his brothers, who had divided his share of the territory between them. The city of Bologna however was lost to the Visconti through the treachery of the governor Oleggio, who sold it to the pope's legate. Barnabò insisted upon having Bologna again, and sent a body of troops for that object in 1360, but was defeated by the army of the pope, who at the same time excommunicated Barnabò. Barnabò laughed at the excommunication, and told the Archbishop of Milan that he was determined to act as pope and emperor in his own dominions. Innocent VI. sent legates to Barnabò to treat with him, but Barnabò obliged the legates to eat the Papal bulls and swallow them piece by piece. One of these legates afterwards became pope under the name of Urban V., and he preached a crusade against Barnabò in 1363, and again by a new bull in 1368. On this last occasion, the emperor, the queen of Naples, the marquises of Ferrara, Monferrato, and Mantua, and other Italian princes, formed a league with the pope against Barnabò, who however contrived to avert the storm, and to conclude a peace in 1369. He did not recover Bologna, for which the pope paid him a sum of money. Gregory XI., who succeeded Urban V., again attacked Barnabò, and prevailed upon the Emperor Charles IV. to deprive both him and his brother Galeazzo of their dignity of imperial vicars, in 1372. A desultory war was carried on in Lombardy and Romagna for some years, during which the papal officers and troops committed so many excesses, that the Florentines, Pisans, and others, joined Barnabò in an alliance, which was styled "the league against the iniquitous clericals." The Visconti made the clergy of their dominions pay the expenses of the war. Two Franciscan monks, who dared to remonstrate with Barnabò for his extortion, were burnt alive by his order. The stories that are told of Barnabò's ferocity are almost incredible, and yet many of them seem well attested. He was very fond of hunting, kept large packs of hounds, and was very cruel to any one who killed game. He kept a number of concubines, by whom he had many children. The only good quality mentioned of Barnabò is that he put down the factions and forbade even the mention of the names of Guelphs and Guibelines under pain of having the tongue cut off. His brother Galeazzo, who had fixed his residence at Pavia, was no less cruel, though less impetuous and more calculating. His horrid penal edict against state prisoners is a fearful instance of the ingenuity of man in tormenting his fellow-creatures. It was styled 'Galeazzo's Law,' because the torturers were so distributed as to last forty days before the wretched victim received the death-blow. At the same time Galeazzo encouraged learning, which Barnabò despised; he opened the University of Pavia about the year 1362, and collected a considerable library. Galeazzo married his son Gian Galeazzo to Isabella, daughter of King John of France, and he gave his daughter Violante in marriage to Lionel, son of Edward III. of England. Galeazzo II. died at Pavia in 1378, and was succeeded by his son Gian Galeazzo, styled count of Vertu, from the name of a fief in France which his wife Isabella brought him as her dowry.

Barnabò continued to rule Milan and the rest of his territories till May 1385, when his nephew Gian Galeazzo, under pretence of having an interview with him, went to Milan with a large escort, surprised Barnabò, and shut him up in the castle of Trezzo, where he died seven months after. Gian Galeazzo allowed the populace of Milan to plunder the houses of Barnabò and of his sons, who were all excluded from the succession by a decree of the general council, and Gian Galeazzo was proclaimed sole lord of Milan and its dependencies, which consisted of twenty-one towns. But he aspired higher; he aimed at making himself king of Italy, or at least of North Italy. With the assistance of Francesco da Carrara, lord of Padua, he drove away the Della Scala from Verona and Vicenza, and afterwards turned against Padua itself and took Padua, and he added to the dominions of Monza, where he died. He seized Bologna by force, as well as part of Romagna, crossed the Apennines and took Perugia and Spoleto. He bought the dominion of Pisa from Gherardo Appiani, who was lord of it; Siena gave itself up to him, and he repeatedly attacked Florence, the only Italian state that successfully opposed his ambitious career. Gian Galeazzo had in his pay the best mercenary troops in Italy, commanded by Jacopo del Verme, and other celebrated condottieri. In May 1395, Gian Galeazzo obtained of the Emperor Wenceslas, for the sum of 100,000 golden florins, a diploma, creating him Duke of Milan; and by a subsequent imperial diploma, dated October of the same year, the boundaries of the duchy of Milan were defined, and made to include 25 towns, from Verona, Vicenza, and Belluno, on the east, to Alessandria and Tortona on the west. On the 5th of September 1395 Gian Galeazzo was crowned with the ducal crown in the square of San Ambrogio, in presence of a vast multitude. He soon after began to build the new cathedral of Milan.

The German princes, indignant at the cession made by Wenceslas of the imperial regions of Lombardy, deposed that weak emperor, and elected Robert count palatine as king of Germany in A.D. 1400. Robert went to Italy with some troops, and summoned Gian Galeazzo to restore to the empire the towns which he occupied. Gian Galeazzo sent Alberico da Barbiano, who defeated Robert near Brescia, and obliged him to recross the Alps into Germany. In 1402 Alberico was besieging Florence, and Gian Galeazzo was only waiting for the surrender of that city to declare himself king of Italy, when he was attacked by the plague which then prevailed in Lombardy, and died in the castle of Marignano in September of the same year. Milan was lost another chance for the union of Italy under a native prince.

Gian Galeazzo left two sons, both minors. The eldest, Giovanni Maria Visconti, fourteen years old, was proclaimed duke. The duchy however was reduced to very narrow limits by the revolt of most of the towns, and the conquests of the Venetians on the east, and of the pope and the Marquis of Monferrato on the other. The young duke, when he came of age, proved puillanimous, auspicious, and cruel. His cruelty partook of insanity. He delighted in seeing men, and even children, torn to pieces by hounds, which he kept for the purpose. A wretch called Squarcia Giramo, who had charge of his kennel, was his confidential friend and minister. Giovanni Maria is said to have caused his own mother to be poisoned. At last a conspiracy was formed against him, and he was stabbed to death on the 16th of May 1412, at Milan, while on his way to church. Squarcia Giramo was torn to pieces by the people. The conspirators, among whom were several of the collateral branches of the Visconti, kept possession of Milan for a few weeks.

Filippo Maria Visconti, at that time twenty years of age, and brother to the late duke, was then staying at Pavia. He was heir to the ducal crown, as Giovanni Maria had left no issue. He was of a timorous, suspicious, and vindictive disposition, but not madly ferocious like his brother. Facino Cane, one of the generals of his father, and who, in the scramble that took place after the death of Gian Galeazzo, had made himself master of Piacenza, Alessandria, Tortona, Novara, and other places, died about the same time as the Duke Giovanni Maria. Beatrice Tenda, Facino's widow, had the command of his territories and of his veteran band of soldiers. It was suggested to Filippo Maria to marry the widow as the means of securing the ducal crown. He did so, and Filippo Maria at the head of Facino's soldiers entered Milan in triumph on the 16th of June, a month after the death of Giovanni Maria. Among the officers of Facino Cane was a native of Carmagnola in Piedmont, named Francesco Bussone, to whom the new Duke Filippo Maria entrusted the

Digitized by Google

command of his troops. The result was, that Bussone recovered for the duke Lodi, Crema, Vigevano, Bergamo, Brescia, Parma, and also took Genoa, which had thrown off the yoke of the Visconti ever since 1356. Francesco Maria afterwards quarrelled with his general, who went into the Venetian service. [CARMAGNOLA, FRANCESCO BUSSONE DE.] But a worse act of ingratitude was perpetrated by Filippo Maria against his wife Beatrice, the widow of his fortune, who was much older than himself, and whom, upon some most improbable charge of infidelity, he caused to be beheaded, in September 1418. After this Duke Filippo Maria lived until the time of his death with Agnese del Maino, a Milanese woman, by whom he had one daughter, Bianca, whom he gave in marriage to Francesco Sforza.

After the defection of Carmagnola, Filippo Maria remained shut up in his dncal residence in the castle of Milan, unseen by his subjects, of whom he was afraid, and surrounded by abject and wily favourites. He had however the discernment to employ able commanders, though not equal to Carmagnola, at the head of his troops, and thus he managed to preserve the greater part of his dominions against the attacks of the Venetians and the Florentines. On one occasion the duke behaved with unexpected magnanimity to Alfonso of Aragon and Naples, who happened to be his prisoner in 1435, and whom he released with presents and even assisted in the recovery of his kingdom of Naples. [ALFONSO V. OF ARAGON, vol. i col. 139.] There was some political shrewdness in the character of Filippo Maria, who seems to have had that kind of ostentation and boastfulness often allied with utter want of principle, for which Italian statesmen were beginning to be noted, and which has been vulgarly styled Machiavellism, because Machiavelli happened to expound the common policy which he saw practised in his lifetime and which had been in practice for a century before him.

Filippo Maria reigned thirty-five years. He died at Milan in the year 1447. The events of the latter years of his life are briefly noticed under STORZA, FRANCESCO, his son-in-law, who succeeded him as Duke of Milan. The dynasty of the Visconti, which may be considered as having begun with Matteo, in 1288, ended with Filippo Maria, and it constituted one of the most powerful Italian principalities of the middle ages.

(Verri, *Storia di Milano*; Muratori, *Annali d'Italia.*)

VISCONTI, ENNIO QUIRINO, was born at Rome in 1751. He was the eldest son of Giovanni Batista Visconti, a native of Sarzana, who, being settled at Rome, where he married a lady of noble birth, became a great proficient in the science of archæology, and succeeded Winckelmann as prefect of the antiquities at Rome. He was commissioned by Clement XIV. to collect works of ancient art for the new museum of the Vatican, an office in which he was confirmed by Pius VI. Giovanni Batista intended his eldest son, who gave very precocious evidence of extraordinary talents, for the church, in which he was sure of patronage; and he made him study the law, in which young Visconti took a doctor's degree in 1771. The pope appointed Ennio Visconti to an honorary situation in his household, and made him sub-librarian of the Vatican. The young man however felt no inclination for a life of celibacy, as he had conceived an attachment for a young lady of the name of Doria. His father was greatly disappointed at this, and, in order to conquer his son's opposition, he induced the pope to remove him from the office of sub-librarian, and deprive him also of a pension which he had granted him. Young Visconti however bore this without complaint, while Prince Spigamondo Chigi, who had become acquainted with him, appointed him his own librarian, and gave him board and lodging in his palace. It was Ennio Visconti who recommended to the prince, for the post of under-librarian, Carlo Fea, who became afterwards a distinguished antiquarian. In 1778 the elder Visconti was commissioned to write the text or letterpress which was to accompany the series of engravings of the Museum of the Vatican, or 'Museo Pio Clementino,' as it was called, in honour of the pope who contributed to form the first splendid collection. Giovanni Batista, being old and infirm, found himself insufficient for the task, and he called his son Ennio to his assistance. The first volume of the series of the 'Museo Pio Clementino' appeared in 1782. In 1784 the elder Visconti died, and his son edited alone the second volume. He was then made by the pope Conservator of the Capitoline Museum, his pension was restored to him, and in January 1785, he married his betrothed, Angela Doria. He continued afterwards to publish in succession the other volumes of the 'Museo Pio Clementino,' the seventh and last of which appeared in 1807. In the mean time he wrote many other treatises and disquisitions on ancient art, such as a dissertation on the sepulchral monuments of the Scipio family, a description of the museum of Thomas Jenkins, a dissertation on the marble statue vulgarly called Pasquino, another on a fine cameo representing Jupiter Ægiochos, found at Smyrna, and an illustration of two Greek inscriptions belonging to a temple and sepulchral enclosure built by Herodes Atticus at a place called Triopium, a few miles out of Rome, on an estate of his wife, Annia Attilia Regilla—'Iscrizioni Triopee, ora Borghesiane, con versioni ecc.,' Rome, fol., 1794. [HERODES, TIBERIUS CLAUDIUS ATTICUS.] He afterwards wrote illustrations of the monuments found among the ruins of Gabii, which were discovered by Prince Marcantonio Borghese, and placed in his villa on the Pincian Mount—'Monumenti Gabini della Villa Pinciana, descritti da Ennio Quirino Visconti,' 8vo, Rome, 1797.

When the French entered Rome, in February 1798, and abolished the papal authority, Visconti was made a member of the provisional government; and when a republican constitution was proclaimed, he was appointed one of the five consuls of the republic. As usual in such cases, he was censured by some for having accepted a revolutionary office, whilst the more violent demagogues accused him of being too moderate in the exercise of his official functions. After a few months however the French military authorities appointed new consuls, and Visconti was glad to return to his favourite studies. When the Neapolitan army entered Rome, in November 1799, Visconti, having filled an office under the republic, was obliged to emigrate to France, where his reputation as one of the first archæologists of his age had preceded him. He was appointed one of the administrators of the Museum of the Louvre, and professor of archæology. There he found himself again among his familiar acquaintance, the masterpieces of the Vatican, which had been transferred to Paris, and he made a catalogue raisonné of the new museum, which was often reprinted with fresh additions. In 1804 Napoleon commissioned him to select and publish a series of portraits of distinguished men of Greece and Rome, such as might be considered sufficiently authentic, with illustrations. This, perhaps the greatest work of Visconti, was published in two series:—'Iconographie Grecque,' 3 vols. 4to, 1808; and 'Iconographie Romaine,' 1 vol. 4to, 1817. Meantime he undertook, at the desire of Napoleon, to contribute several important papers to the great collection entitled 'Musée Napoleon.' He also wrote a number of separate dissertations upon particular objects of ancient art. In 1815 Visconti came to London for the purpose of giving his opinion on the merit and the value of the sculptures, some of the Parthenon, known by the name of 'Elgin Marbles.' He fixed the price at which he estimated that those works of art might be fairly purchased by the nation. After his return to Paris he wrote a Memoir in explanation of the meaning of those celebrated sculptures. He next completed a series of notices of the works of art in the Borghese collection, which he had begun at Rome many years before, and which were published after his death: 'Illustrazioni di Monumenti scelti Borghesiani,' Rome, 1821.

In 1816 Visconti began to feel the symptoms of an organic disease, which brought him to the grave February 7, 1818. His death was mourned by the learned all over Europe, and his funeral was attended by distinguished men from various countries. He was no mere antiquarian, but was deeply versed in the history, the languages, the mythology, and the manners of the classical ages, and he had a keen discernment and a delicate taste for the works of ancient art. A worthy successor of Winkelmann, his judgment was more precise and his views were more extensive than those of his predecessor. A collection of all Visconti's works was begun at Milan in 1818, but has never been entirely completed. Labus edited, in 1827, a selection of his minor works in 4 vols. 8vo.

('Elogio d'Ennio Quirino Visconti, scritto dall' Abate G. B. Zannoni, R. Antiquario della Galleria di Firenze,' in No. XVIII. of the *Antologia* of Florence; Tipaldo, *Biografia degli Italiani Illustri*; Maffei, *Storia della Letteratura Italiana.*)

VISCONTI, FILIPPO AURELIO, younger brother of Ennio Quirino, was appointed by Pius VI., in 1782, to succeed his father Giovanni Batista, as superintendent of the antiquities of Rome. During his father's absence from Rome, in 1809-14, he was made president of the commission of antiquities and fine arts, and was also one of the deputies appointed to superintend the preservation of the numerous churches of Rome. After the restoration of the Papal government he was appointed, in 1816, secretary of the commission of the fine arts. He edited the 'Museo Chiaramonti,' being a description of the collection formed in the Vatican by Pius VII., and which forms a sequel to the 'Museo Pio Clementino.' He also published several dissertations concerning works of ancient art in Rome and in its territories. His applied himself especially to the study of numismatics. He edited an improved edition of the 'Roma' of Venuti. He was born at Rome July 10, 1754, and died there March 30, 1831.

VISCONTI, LOUIS JOACHIM, son of Ennio Quirino Visconti, was born at Rome February 11, 1791. His father removed from Rome at the close of 1799 to remove with his family to Paris, and there the young Visconti was carefully educated. Having selected architecture as his profession, his father, as soon as he was of sufficient age, placed him with the architect Percier (PERCIER, CHARLES), so well known by his works on the Louvre, a building with which the name of the pupil was to become still more intimately associated. Under Percier, Visconti made a distinguished progress, carrying off at the Architectural School five medals, and a second prize for the plan of a library. Having left the termination of his pupilage, he obtained an appointment as inspector of public buildings; and subsequently that of architect and surveyor of the third and eighth arrondissements of Paris, an office he held for above a quarter of a century. He was further, in 1825, appointed architect of the Bibliothèque Royale, and he is said to have made no less than twenty-nine plans and elevations in the hope of being directed to give to that building an architectural character equal to the grandeur of its contents, but his ambition was not gratified. Although not called upon to construct any important edifice, M. Visconti found ample employment in connection with the office he held; and to him was entrusted some of the public monu-

Digitized by Google

ments with which Paris has of late years been adorned. Several of the finest fountains in Paris, including those of St. Sulpice, the Place Louvois, Gaillon, and Moliere, were executed from his designs. The Tomb of Napoleon I. is also by him, and is his grandest work of the kind, but he also designed the monuments of Marshals Soult, St. Cyr, Suchet, Lauriston, and those of some other generals and eminent men. He was likewise called upon to design innumerable triumphal arches and other temporary structures for fêtes and occasions of public rejoicings and ceremonies, and his taste and fertility of invention were generally admired. He also designed several hotels and private residences. But the work with which his name will be most permanently connected is, perhaps, the completion of the Louvre, and its connection with the Tuileries. The Emperor Napoleon III. having decided on completing this the favorite project of the first Napoleon, M. Visconti was directed to prepare the necessary plans, and these having met with the emperor's approval, the first stone of the new works was laid on the 25th of July 1852. The operations were pressed forward with the greatest vigour, but Visconti did not live to see this his greatest work completed. He died on the 29th of December 1853, having been struck with apoplexy, which is said to have been brought on, or hastened, by over exertion and anxiety. Visconti's plans were carried out to completion under the superintendence of M. Lefuel, who was appointed to succeed him, and on the 14th of August 1857, the vast undertaking was declared finished, and the junction of the Louvre and the Tuileries was inaugurated with great solemnity by the emperor. Of course in such a work, the new buildings having to be rendered uniform in their elevation with those already existing, there was little room for originality, but it is admitted that Visconti has overcome the difficulties arising from the peculiarities of the site in a very masterly manner, and that he has by his additions,—which, while harmonising with the older portions, are more ornate and sumptuous in style,—rendered it one of the most magnificent royal residences in Europe.

VISIN, or VON VISIN, DENIS IVANOVITCH, one of the most eminent Russian writers of the 18th century, and in his own peculiar walk the most eminent of them all, was born at Moscow, April 3rd, 1745, of parents in easy circumstances. Except in regard to moral instruction, to which point his parents were very strict, his early education was a common one. He was sent first to the Gymnasium, afterwards to the University of Moscow, and whilst studying there was selected as one of the pupils to accompany the rector to St. Petersburg, to be presented to Count Shuvalov (the founder and patron of the establishment), as worthy of notice for their superior probabilities. Their reception was flattering, and the splendour of the court and the more refined tone of the northern capital made a strong impression upon Von Visin. The theatre more especially appeared to him a region of enchantment, and he had an opportunity of becoming personally acquainted with Volkov [VOLKOV] and other leading actors of that time, a circumstance that contributed to encourage his taste for the drama. It was also his good fortune to meet with Lomonosov, whom merely to have seen was an event in his life, and from him he received some sound advice on the importance of pursuing his studies systematically. On his return to Moscow, and while he still continued at the university, he made his first essays in literature by translating Holberg's Fables not from the original, but the German, and Terrasson's philosophical Romance of 'Sethos,' which were followed by a version of Voltaire's 'Alzire'—a writer whom he then as greatly admired as he afterwards detested. Though these productions were reckoned by himself among the indiscretions of his youth, they served to make him known, and his Alzira more especially recommended him to the notice of the minister Count Panin, who instrumental in his an appointment in his own department, the duties of which were made little more than nominal, in order that he might prosecute his literary studies. Notwithstanding the apparent enviableness of a position that seemed to give both present enjoyment and a brilliant prospect for the future, Von Visin quarrelled with his good fortune, perhaps because it had come too easily, and, in consequence of jealousies and misunderstandings between himself and another protégé of the count's, quitted his employment and his patron. After this precipitate step he seems to have led for awhile a rather unsettled life, associating with companions who were of very libertine principles, and of by no means irreproachable conduct. From the ill-effects of their example he was partly preserved by infirmity of constitution, and by his being subject at that time to almost continual headaches; and it was moreover his good fortune to be reclaimed from such dangerous connections by an intimacy which he shortly afterwards formed with an amiable family at Moscow.

Warned by the past and encouraged for the future, Von Visin began again to apply himself to study, and became ambitious of not merely succeeding as an author, but of enriching the literature of his country with productions of an original and national character. On surveying what had up to that time been done in the language, he perceived that a wrong course had been pursued—that instead of being allowed to show itself at will, native talent had been both misdirected and checked by imitation. The literature was in danger of becoming one of mere routine; epics, odes, tragedies, were all alter established and "approved models," and though correct as to mere pattern, they were cold, colourless, and feeble.

He accordingly determined to give his countrymen a specimen of comedy—not a drama of the kind at second-hand, but such as should be, and should be felt to be, thoroughly Russian in every respect. The result was most successful: the 'Brigadier' (written and first performed in 1764, though not printed till nearly twenty years afterwards) conferred on him immediate popularity. Nevertheless he showed himself in no hurry to obtain a second triumph of the kind, for it was not until eighteen years afterwards that he produced his second piece, the 'Nedorosl,' or Spoiled Youth. In fact he seemed well content to live upon the fame of his 'Brigadier,' and the reputation it acquired for him both at court and with the public. He did not indeed lay aside his pen, but employed it chiefly in translating from the French, and among other things Barthélemy's 'Amours de Charité et de Polydore,' and Bitaubé's 'Joseph.'

In 1777 he visited France for the benefit of his health; and his residence at Paris seems to have greatly abated his admiration of the French people, and more especially of French philosophers. Only six letters of his correspondence from that capital, with Counts Panin and Orlov, have been preserved, a circumstance the more to be regretted because, besides being interesting in themselves, they are superior specimens of style; and in fact Von Visin was by far the best Russian prose-writer of the last century. Restored to health and cured of his French predilections, he returned to St. Petersburg, where, after passing some time in inactivity, he produced, in 1782, his second and still more successful comedy, the 'Nedorosl.' This piece seems now an exaggerated picture of manners, even in Russia itself; yet that such is the case is rather an honour than a reproach to Von Visin, for by correcting the extravagances to which his satire was applied, he himself has destroyed the ridicule of the piece. The 'Nedorosl' was his last dramatic production, for he seemed disposed to take Potemkin's compliment on the occasion as serious advice. "Denis," said the prince to him, after the first representation, "there is now nothing left for you to do but go home and die, since, were you to live for ever, never again would you write anything half so good!" That severity of composition and fertility of invention which distinguished Lope de Vega, Goldoni, and many other dramatic writers, were certainly not possessed by Von Visin; and, as has been further remarked by his critic Prince Wiasemsky, his talents were rather that of a powerful comic satirist than that of a dramatic genius. Though he continued to write from that time, he produced nothing of importance—chiefly miscellaneous pieces for various journals, which would now be forgotten, but for the interest which they derive from the author's name. One production of this remark however must be excepted—a fragment of permanent value, his 'Ispovied,' or Confessions, a sort of autobiography, from which it appears that he had long renounced the principles which he had imbibed at his first outset in life, and patiently submitted to the salutary chastisement of the affliction of bodies intercupted ill-health. He again recovered however in some degree, and once more applied to his literary occupations. His very last production of all was another comedy, entitled the 'Hofmeister,' which only the day before his death he put into the hands of Derzhavin and Dmitriev, who are said to have agreed with him that it was still better than his former ones. Nevertheless we are told that the manuscript was lost, and could never afterwards be traced anywhere—so very strange a story, as to be scarcely credible. Von Visin died October 1 (13), 1792, at the age of forty-seven. Of his complete works two editions have since been published; yet it must be owned that although he did much for the literature of his country, it lies within a very small compass, and all the rest that he did does not appear to correspond to his reputation.

VITALIANUS, a native of Signia, succeeded Eugenius I. in the see of Rome, A.D. 657. He sent envoys to Constantinople to signify his election to the Emperor Constans II., called by some Constantine, who received them favourably and confirmed the privileges of the Roman Church, and sent back the envoys with presents to Rome. Aribert I., son of Guntwald of Bolearia, and nephew of Queen Theudelinda, was at the time king of the Longobards, but the duchy of Rome bore allegiance to the Eastern empire, and was included in the administrative jurisdiction of the exarch of Ravenna. About 663 the Emperor Constans landed at Tarentum with a large force, invaded the duchy of Beneventum and laid siege to that town, whose duke, Grimwald, had gone to Pavia, where he had by treachery seized the crown of the Longobards. Grimwald, who had left his son Romuald as duke of Beneventum, upon hearing of the invasion of the Byzantines hastened to relieve Beneventum, when Constans was obliged to raise the siege and withdraw to Naples, from whence he repaired to Rome. Vitalianus went at the head of his clergy to meet the emperor outside of the walls, and conducted him to St. Peter's Church. Constans afterwards visited the Lateran and the other principal churches of Rome, and after remaining twelve days in that city he returned to Naples. But before he left Rome he ordered the principal monuments of the city to be stripped of their bronzes, and other ornaments, and the Pantheon among the rest, not sparing even the external bronze covering of the dome. The booty was shipped for Syracuse, whither Constans repaired, and where he intended to fix his residence. Most of the bronzes were afterwards seized by the Saracens when they plundered Syracuse.

In the year 666 a controversy took place between Vitalianus, and

Digitized by Google

Maurus, archbishop of Ravenna, who refused to acknowledge the supremacy of the see of Rome, and to receive the pallium from the hands of its bishop. Vitalianus summoned Maurus to Rome under pain of excommunication, and the archbishop retorted by sending him a letter in which he anathematized Vitalianus. Both Vitalianus and Maurus appealed to the Emperor Constans, who by a diploma, dated Syracuse, on the Calends of March, in the year xxv. of Constantine the Elder, emperor, decreed "that the Church of Ravenna should be ever after independent of every other ecclesiastical authority, and especially of that of the patriarch of old Rome, and should enjoy the privilege of being autocephalus;" and he informed the archbishop of his having written to that purport to the church of Gregory. Muratori quotes this diploma, which he found in the library of Modena.

In the year 668 Vitalianus consecrated Theodore of Tarsus as archbishop of Canterbury, and sent him to England with instructions to establish and enforce unity of discipline in the churches of Britain, an object which Theodore effected, though not without much difficulty, at the council of Hertford, A.D. 673.

Vitalianus died at Rome in the year 672, and was succeeded by Deodatus or Deusdedit II.

VITALIS. [Sidonius.]

VITELLIUS, AULUS, a Roman emperor, whose reign lasted little more than ten months, A.D. 69. He was of a noble family, and his father Lucius Vitellius had been honoured several times with the consulship (A.D. 34, 43, and 47), and afterwards appointed praefect of Syria. He was a man of effeminate and luxurious habits, and his son Aulus inherited these qualities from his father; he was also prodigiously fond of the pleasures of the table. His manners were probably pleasing, as he enjoyed the favour of three successive emperors, Caligula, Claudius, and Nero. He was first made consul in A.D. 48. After Galba had been elevated to the imperial dignity in A.D. 68, he ordered Fonteius Capito, the commander of the legions in Germany, to be put to death, and appointed Aulus Vitellius in his stead. Galba was unpopular with the soldiers, as he did not attempt to win their favour by rich donatives; Vitellius, on the other hand, was the idol of his troops, whom he indulged to himself by liberal gifts and by still more liberal promises; and at the beginning of the year A.D. 69, Vitellius was proclaimed emperor. On the arrival of this news at Rome, Galba adopted L. Piso Licinianus, a noble and unassuming youth; but the pretorians were discontented with Galba's stinginess, and a conspiracy was formed against him, which was headed by L. Salvius Otho Titianus, who was himself proclaimed emperor by the soldiers, and ordered Galba and his friends to be put to death (Jan. 15, A.D. 69). The Roman empire had now two emperors, whose rival claims could only be settled by the sword. Vitellius sent two of his generals to occupy the Pennine Alpe and the part of Italy north of the Po (Gallia Transpadana). Otho marched against them, and met the enemy near Bedriacum; but his army being defeated, he despaired of success, and put an end to his life about the middle of April. His army recognised Vitellius as emperor, who now came to Rome. He had scarcely arrived there, when Flavius Vespasianus, who was then engaged in the war against the Jews, was urged by his friends to assume the imperial dignity, and was actually proclaimed emperor on the 1st of July, at Alexandria by Tiberius Alexander, the praefect of Egypt. Vespasian was immediately recognised by the legions in Judaea and Syria, and soon afterwards also by those of Moesia and Pannonia. Antonius Primus, the commander of the latter, marched into Italy without waiting for the commands of Vespasian. The defensive plans of Vitellius were betrayed by his own general, Caecina; and his army, though far superior in numbers to that of the enemy, was routed in an engagement which took place during the night between Bedriacum and Cremona. His camp near Cremona was taken by the enemy, the soldiers surrendered, and Cremona was burnt. The victorious army slowly advanced towards Rome; the garrisons stationed in the various towns on their road surrendered at the approach of Antonius, and Vitellius at Rome, wavering between fear and hope, could not come to any resolution, but allowed his adherents to act as they pleased. On the arrival of the hostile army in the city, and during the civil bloodshed which ensued, Vitellius concealed himself; but he was dragged from his hiding place and murdered, at the age of fifty-seven. His body was thrown into the Tiber. This was about the end of December, A.D. 69. His brother Lucius Vitellius was likewise put to death, and the rest of his adherents surrendered.

(Suetonius, *A. Vitellius*; Tacitus, *Historiae*; S. Aurelius-Victor, *De Caesar.* 8; Eutropius, vii. 12.)

VITELLO (commonly, but incorrectly, VITELLIO), was a native of Poland, and was commonly thought to have lived in the 10th century, till it was shown, from his own work, that he lived in the 13th. He wrote his work on optics near Cracow, as is supposed; but it appears that he had lived some time in Italy. Nothing more is known of him except some unimportant facts relative to his family.

There are said to be works of Vitello remaining in manuscript, but the only one which has been printed is that on optics, which has had three editions. The first was 'Vitellionis Perspectivae Libri Decem,' in folio, Nürnberg, 1535, edited by Tanstetter and Apian; the second, 'Vitellionis Mathematici Doctissimi de Optica,' &c., folio, Nürnberg, 1551; the third, 'Optice Thesaurus Alhazeni, &c. Item, Vitellionis Thuringo-Poloni Libri Decem,' folio, Basel, 1572, edited by Risner. This work is admitted, by all who have consulted it, to show a profound knowledge of the ancient geometry. Montucla and also Libes say that in optics it is little more than a translation of Alhazen; this is wholly denied by the writer of the Life in the 'Biographie Universelle,' who does not however give any information on the points in which the two works differ, and does not precisely specify the points in which he considers Vitellio to have augmented the existing knowledge of optics. But Libes asserts that Vitellio distinctly attributes the rainbow to combined reflection and refraction; as also that he accounts for the luminous rings which are seen round the sun and moon by the refraction of light in haze or vapour, and for parhelia, &c. by refraction from clouds. Dr. Young states the theory of refraction to be more correct than that of Alhazen, and refers to him as the constructor of an original table of refractive powers.

VITRINGA, CAMPE'GIUS, an eminent Dutch theologian, was born on the 16th of May 1659, at Leeuwarden, in Friesland. He studied at Franecker and Leyden, and after having obtained in the latter place the degree of doctor of divinity at the unusually early age of twenty, he was appointed in 1681 professor of Oriental literature at Franecker. Two years later he obtained the chair of theology, and in 1693 that of sacred history also. In 1698 he was invited to a professorship in the university of Utrecht, with the high salary of 2000 thalers, but he modestly declined the offer, in consequence of which his salary was raised at Franecker to the same amount, and he remained in that place until his death on the 31st of March 1722. He left two sons, Campegius and Horatius, the former of whom likewise acquired some reputation as a theological writer, though he was much inferior to his father.

Campegius Vitringa was one of the greatest divines of his time, and in learning he was not inferior to any. His works, nearly all of which are in Latin, are still valued very highly by theologians, but more especially his commentaries on portions of the Scriptures, among which that on Isaiah is one of the best that was ever written. The following works still deserve the attention of theological students:—1, 'Commentarius in Jesaiam,' 2 vols. folio; 2, 'Anacrisis Apocalypseos Johannis Apostoli,' 4to, 1719; 3, 'Commentarius in Prophetam;' 4, 'Typus Theologiae Practicae,' 8vo, 1 vol.; 5, 'Observationes Sacrae,' 4to, 1711; 6, 'Doctrina Religionis Christianae per Aphorismos descripta;' 7, 'Verklaring over de Evangelische Parabelen;' and 8, 'Aanleiding tot het regte Verstand van den Tempel Ezechiels.'

(Vriemoet, *Series Professorum Franequeranorum*; Niceron, *Mémoires des Hommes Illustres*, vols. xxx. and xxxv.)

VITRUVIUS POLLIO, MARCUS, a Roman architect, well known for his work on architecture, 'De Architectura,' in ten books. The history of Vitruvius is known only by what he casually says of himself in his treatise. He is noticed only by two ancient writers: by Pliny, who enumerates him among the writers from whose works he collected; and by Frontinus, in his treatise on aqueducts, 'De Aquaeductibus,' who mentions him as the inventor of the Quinarian measure. Neither the time nor place of his birth is known, but he is generally supposed to have been born at Formiae (Mola di Gaeta) in Campania, from several inscriptions relating to the Vitruvian family which have been found there. As he dedicated his work to the Emperor Augustus when he was already old, and as it was written before the theatres of Marcellus and Balbus were built, which was in the year B.C. 13 (for when Vitruvius wrote, the theatre of Pompey was the only stone theatre in Rome), it follows that he must have been born about B.C. 80, or a little earlier. From what he says in the prefaces to his third and sixth books, it would seem that he was not very successful in his profession; he executed only one public work that is mentioned, a basilica at Fanum. He was however, at the time that he wrote, one of the superintendents of the engines of war, the others being Marcus Aurelius, P. Numisius, and Cn. Cornelius: a place which he had obtained through the recommendation of the emperor's sister; and it was on account of this appointment, as he himself says, that he dedicated his work to the emperor. He states that he had received a good education, and was fond of literary and philosophic subjects; that riches were no object with him, and that he was possessed of very little; but that he hoped to acquire a reputation with posterity for the treatise he was then writing. He mentions in the preface to his seventh book the architectural writers to whom he was chiefly indebted for information, namely, Agatharchus, Democritus and Anaxagoras, Silenus, Theodorus, Ctesiphon and Metagenes, Phileus, Ictinus and Carpion, Theodorus Phocaeus, Philo, Hermogenes, Argellus, and Satyrus and Phyteus. He mentions also many other writers who wrote on the subjects more or less relating upon architecture.

Vitruvius treats of many things in his work besides architecture or building, strictly speaking. The first book is divided into seven chapters, as follows:—Chapter 1 treats of the science of architecture generally, and of the education of an architect; and he mentions in it the origin of Caryatides and the Persian order, in illustration that a certain knowledge of history is requisite for an architect. He recommends also to architects, to a certain degree as almost indispensable, the study of writing, drawing, geometry, arithmetic, the principles of natural and moral philosophy, law, physic, music, and astronomy: and he continues to show how far each may be applied: chapter 2, on what architecture depends, or the various qualities which

Digitized by Google

regulate its principles, as disposition (θέσεις), proportion or dimensions (ποσότης), and economy or arrangement according to the uses for which the building is required (οἰκονομία), &c.: chapter 3, of the different branches of architecture; of building, of dialling, and of mechanics: chapter 4, of the choice of situations for buildings, in which healthiness should be the chief consideration: chapter 5, of the foundations of walls and towers, and their security: chapter 6, of the situations of the buildings of the town within the walls, which should be so disposed as to be sheltered from the winds; and of the winds, which were eight principal among the Greeks, but there were many other names for the various winds coming from different directions, of which, together with the eight principal, Vitruvius has made a diagram or σχῆμα, naming altogether twenty-four: chapter 7, of the situations of public buildings, in which he states that the temples of Venus, Vulcan, Mars, and Ceres should be without the city.

Book II. In the introduction he relates an anecdote of Alexander and Dinocrates, and the proposition of Dinocrates to convert Mount Athos into a statue of Alexander, &c. Chap. 1 treats of the origin of building, of the first appearance of fire, &c.: chap. 2, of the origin of all things, according to the opinions of the philosophers: chap. 3, of bricks, of the earth of which they ought to be made, and of their dimensions: chap. 4, of sand: chap. 5, of lime: chap. 6, of Pozzolana: chap. 7, of stone-quarries: chap. 8, of the different kinds of walls, of the *reticulatum* and the *incertum*, and of the *testaceum*, the *pseudisodomum*, and the *emplectum*; also of cramping brick with iron recommended in preference to stone; of the city of Halicarnassus and of the fountain of Salmacis, &c.: chap. 9, of timber: chap. 10, of the Apennines, and of the fire called *infernax* and *superne*.

Book III. In the introduction he mentions a few successful and unsuccessful artists, and various causes of success. Chap. 1 treats of the design and symmetry of temples, of 'perfect numbers,' and of the names of temples, as—*in antis*, *prostylos*, *peripteros*, *pseudodipteros*, *dipteros*, *hypæthros*: chap. 2, of the five species of temples—*pycnostylos*, *systylos*, *diastylos*, *areostylos*, *eustylos*: chap. 3, of foundations, and of columns and their ornaments.

Book IV. Chap. 1, of the origin of the three kinds of columns, Doric, Ionic, and Corinthian; and of the origin of the Corinthian capital: chap. 2, of the ornaments of columns: chap. 3, of the Ionic proportions: chap. 4, of the proportions of the cell and of the arrangement of the pronaos of a temple: chap. 5, of the aspects of temples: chap. 6, of the proportions of doors of temples: chap. 7, of Tuscan temples: chap. 8, of the altars of the gods.

Book V. Of Public buildings. Chap. 1, of the forum and basilica: chap. 2, of the treasury, prison, and curia: chap. 3, of the theatre and its situation: chap. 4, of harmony, of the doctrine of Aristoxenus: chap. 5, of the brazen vases (ἠχεῖα) used in theatres for increasing the sound: chap. 6, of the vaults of a theatre: chap. 7, of the porticos and other parts of a theatre: chap. 8, of the three sorts of scenes, the tragic, the comic, and the satyric; and of the theatres of the Greeks: chap. 9, of the porticoes and passages behind the scenes; and of walks: chap. 10, of baths: chap. 11, of the palæstra: chap. 12, of harbours and other buildings in water.

Book VI. Of the arrangement and symmetry of private buildings. In the introduction he speaks of the advantages of learning, and relates an anecdote of Aristippus, the philosopher. Chap. 1, treats of the situations of buildings, according to the nature and climate of different places: chap. 2, of their proportions, according to the nature of their sites: chap. 3, of courts (cavædia), the *Tuscan*, the *Corinthian*, the *tetrastylon*, the *displuviatum*, and the *testudinatum*: chap. 4, of courts (atria), wings or aisles (alæ), the *tablinum* and the *peristylium*: chap. 5, of *triclinia*, *œci*, *cyzici*, *pinacothecæ*, and their dimensions: chap. 6, of the œci (halls) of the Greeks (ναῦσικροι): chap. 7, of the aspects of different kinds of buildings: chap. 8, of houses suited to persons of various ranks: chap. 9, of the proportions of countryhouses: chap. 10, of the arrangement and parts of these houses, and of some Greek customs; of pictures called *Xenia*; of some discrepancies in Greek and Roman names of apartments, &c.; and of the origin of the representation of Atlas with a globe upon his shoulders: chap. 11, of the strength of buildings.

Book VII. Of the finishing and decoration of Private Buildings. In the introduction, he speaks of books, libraries, and of book-making; of many writers on the arts and sciences, and also of some of the principal buildings of the Greeks, and their architects—as the temple of Diana at Ephesus, of Apollo at Miletus, of Ceres and Proserpine at Eleusis, of Jupiter Olympius at Athens, and of Honour and Virtue at Rome. Chap. 1 treats of pavements: chap. 2, of stucco: chap. 3, of stucco-work, and the method of preparing walls for painting or colouring in fresco; and of the excellence of Greek plaster: chap. 4, of stucco-work in damp places, and of ornaments for vaulted roofs: chap. 5, of the use of painting in buildings, and the different kinds of pictures proper for various apartments; of the inferiority of such decorations in the time of Vitruvius to those of the ancient Greeks, and an anecdote of a scene painter of Alabanda: chap. 6, of the preparation of marble for plastering for painting: chap. 7, of natural colours or such as are found in the earth: chap. 8, of vermilion and quicksilver, and of *anthrax*; and of the method of recovering gold from old gold embroidery: chap. 9, of the preparation of vermilion, and a test of its purity: chap. 10, of artificial colours and of black:

chap. 11, of Alexandrian blue, and of burnt yellow: chap. 12, of white-lead, of verdigris, and of red-lead: chap. 13, of purple: chap. 14, of factitious colours, purples, attic ochre, and indigo.

Book VIII. Of Water. In the introduction some ancient opinions concerning water are noticed. Chap. 1 treats of the methods of finding water: chap. 2, of rain water, of climates and of rivers: chap. 3, of the nature of various waters, of hot-springs, of mineral waters, of poisonous and of acid waters, and of remarkable fountains, &c.: chap. 4, the same subject continued, the water of the Balearic Isles good for singing: chap. 5, of methods of judging of water: chap. 6, of levelling, and of the instruments used for that purpose, the chorobates, the level (libra aquaria), and the chorobates: chap. 7, of conducting water, which was done in three ways, in streams or chasuels, in leaden pipes, and in earthen tubes—Vitruvius recommends the last; also of wells and of cisterns.

Book IX. On the principles of gnomonics and the rules of dialling. In the introduction he makes a few remarks in praise of the great services of many of the Greek philosophers. Chap. 1 treats of Plato's method of doubling the area of a square: chap. 2, of Pythagoras's method of constructing a right-angled triangle: chap. 3, of Archimedes's method of detecting silver when mixed with gold, also of discoveries of Archytas of Tarentum and of Eratosthenes of Cyrene, &c.: chap. 4, of the universe and of the planets: chap. 5, of the sun's course through the twelve signs: chap. 6, of the northern constellations: chap. 7, of the southern constellations; of the Chaldæans, and of several Greek astronomers: chap. 8, of the construction of dials by the Analemma: chap. 9, of various dials and their inventors.

Book X. Of Machines. In the introduction Vitruvius notices a salaried architect of Ephesus, which architects and others to their contracts, and regrets that no such law was in force at Rome. Chap. 1, treats of machines and engines generally, as scaling-machines, machines set in motion by the wind, and draught machines; also of the loom and other machines: chaps. 2, 3, 4, and 5, of machines of draught, of the wheel and axle, pulley, &c., and polyspaston: chap. 6, of Ctesiphon's contrivance for removing great weights, when he removed from the quarry the shafts of the columns for the temple of Diana at Ephesus: chap. 7, of the discovery of the quarry whence stone was procured for the construction of the temple of Diana at Ephesus: chap. 8, of the principles of mechanics: chaps. 9 and 10, of engines for raising water, of the *tympanum*, and of water-mills: chap. 11, of the water-screw: chap. 12, of the machine of Ctesibius for raising water to a considerable height: chap. 13, of the water-organ, a very complex machine, which Vitruvius has done his utmost to say, in vain: chap. 14, of machines for measuring the distance you travel by land or by water: chap. 15, of estaphilæ and scorpions: chaps. 16, 17, and 18, of ballistæ and catapultæ: chap. 19, of machines for attack, of the ram and of the tower: chap. 20, of machines for defence, of ditches: chap. 21, of other tortoises: chap. 22, of machines for defence.

There have been many editions of Vitruvius; the Editio princeps was printed, without date or name of printer or place, about 1480, at Rome, by George Herolt, in folio, under the superintendence of Sulpitius. It commences, without a title, with 'In Sulpitii Lectori salutem. Cum divinum opus Vitruvii,' &c. The small work of Frontinus, on Aqueducts, was printed with it. The next edition was published at Florence, in 1496, with some other treatises, also in folio; it is equally scarce with the Editio princeps. There have been many others: at Venice, fol. in 1497; and again, in folio, with wood-cuts, in 1511; the Giunta edition, at Florence, in 8vo, in 1513, also with wood-cuts; reprinted in 1522; again in 1523, without place or date; at Strasburg, in quarto, in 1543; reprinted in 1550, with the notes of Philander, which were first published at Rome, in 1544, without the text; at Lyon, by Philander, in quarto, in 1552, 'M. Vitruvii Pollionis de Architectura Libri Decem ad Cæsarem Augustum, omnibus omnium editoribus longe emendatiores, collatis veteribus exemplis,' &c.; at Venice, in folio, in 1567, by Barbaro; at Lyon, in 1586; Amstelodami, printed by Elsevir, in folio, in 1649, with additional notes and commentaries, and some other treatises, edited by John de Laet; at Naples, in folio, in 1758, with an Italian translation by the Marquis Galiani; at Berlin, in 2 vols. quarto, in 1800, with a glossary in German, Italian, French, and English; at Strasburg, in 8vo, in 1807; and in the same year, by Schneider, at Leipzig, in 3 vols. 8vo., which is the best edition that has appeared, but it is without plates.

M. Quatremère de Quincy ('Biographie Universelle') states that the first manuscript of Vitruvius was found in the library of the Benedictine abbey of Monte Cassino, near Naples, and that the best is in the library of Francker. The translations of Vitruvius into various languages are likewise numerous: the following are into French; by Jan. Martin, Paris, folio, in 1547; reprinted in 1572; by Jean de Tournes, Geneva, quarto, in 1618; by Perrault, with copper-plates, Paris, folio, in 1673; another edition, by the same translator, in 1684; an abridgment by the same in folio, 1674 (of which an English translation was published in London, 8vo, 1692, and several times reprinted); by Le Blond, Brussels, quarto, in 1816; into German, by Rivius, Nürnberg, folio, in 1548, reprinted at Basel, in 1575, and again at the same place in 1614; by Rode, Leipzig, 2 vols. quarto, in 1796; the first volume contains a Life of Vitruvius: into Italian, by Benedict Jovius and Cæsar Cesarinus, one of the architects of the cathedral of Milan, Como, folio, in 1521; reprinted at Venice in 1524,

Digitized by Google

but without the notes of Cæsarius; and again, with a less copious index, in 1535. The first five books, by Caporali, Perugia, folio, in 1536; by Barbaro, Venice, folio, in 1556; and again, by Barbaro, in quarto, in 1567, reprinted in quarto in 1584, and in small folio in 1629 and in 1641; and by the Marchese Galiani, with the Latin text, in 1758; in folio, at Naples, and without the Latin, in 1790; into Spanish, by Urrea, Alcala de Henarez, folio, in 1602; and at Madrid, by Ortiz y Sanz, large folio, with plates, in 1787; into English, by R. Castell, with notes by Inigo Jones and others, 2 vols. fol. 1730; by W. Newton, London, 2 vols. fol., with plates, in 1771-91; by W. Wilkins, R.A., 'The Civil Architecture of Vitruvius,' in two parts, 4to, in 1812, being a translation of the third, fourth, fifth, and sixth books only; but the text is not entire and the introductions are omitted; and by Joseph Gwilt, London, in royal 8vo., in 1826, to which is prefixed a list of the several editions and versions of Vitruvius, of which the one here given is an abstract. His work was translated into Flemish by Peter Koek.

VITTORINO DA FELTRE, was born in 1379, at Feltre in North Italy, studied at Padua under the celebrated Guarino of Verona, and afterwards became professor of rhetoric and philosophy in the same university. Being some time after invited by G. F. Gonzaga, lord of Mantua, to superintend the education of his children, Vittorino repaired to Mantua, where a separate and commodious residence was prepared for himself and his pupil, which was named 'La Giocosa.' Other youths of distinction repaired thither in succession to avail themselves of Vittorino's instruction, and among them Federico di Montefeltro, afterwards duke of Urbino, Giberto, prince of Correggio, Taddeo Manfredi, of the princely house of Faenza, Gio. Battista Pallavicino, afterwards bishop of Reggio, Lodovico Torriano and Bernardo Brenzoni, who became afterwards celebrated as jurists, Theodore Gaza and George of Trebisond. Vittorino died February 2, 1447.

Ambrogio Traversari, or Camaldulensis, who visited the school of Vittorino at Mantua, gives in his Epistles (lib. vii. & viii.) an interesting account of his system of education; and Carlo Rimini has written a work on the same subject, entitled 'Idea dell' otimo precettore nella vita, e disciplina di Vittorino da Feltro a de' suoi discepoli.' It appears from the example of Vittorino, of Guarino Veronese, and others, that education in the larger sense of the term, was better understood in Italy in the 14th century than it has been since, but it was confined to the upper classes. Gymnastics formed a part of Vittorino's system. He lived with his pupils and took his meals with them. Their fare was wholesome, but plain. He had tablets of various colours to teach the younger pupils the rudiments of reading. His older pupils were instructed in rhetoric, mathematics, and ethics. He was very strict with regard to their morals. He watched the disposition and abilities of each pupil, in order to direct him to that particular professional course for which he was best adapted. Temperate in his corrections, he allowed time to pass between the offence and its punishment, and he never showed himself out of temper. He was beloved by his disciples, and he loved them like a father. Such was the character of this distinguished preceptor.

(Corniani, *I Secoli della Letteratura Italiana*; Tiraboschi, *Storia della Letteratura Italiana*; Rosmini, as above mentioned.)

VIVARES, FRANÇOIS, a celebrated engraver, born at Lodeve, near Montpellier, in 1709, and died in London in 1780. He was, it is said, originally a tailor, but he did not keep long to that occupation. He came early to England, and learned landscape-engraving here from J. B. Chatelain, but being possessed of great ability, he studied from nature direct, and formed a style of his own. His great excellence was in foliage, and he was one of the best engravers after Claude, "and preserved," says Strutt, "as much of the picturesque beauties of that admirable painter as could be expressed by two colours only." Strutt continues: "He kept a print-shop in Newport-street, near Newport Market, for a considerable length of time, where he died some few years since. His widow still continues in the same shop (1786), and carries on the print-selling business."

Vivares etched also with great freedom. His prints are not uncommon: Huber, in his 'Manuel des Amateurs,' &c., mentions fifty-seven, many of which are English landscapes. Strutt notices only four, all after Claude Lorraine. His works are unequal: some are hard, and are totally deficient in aërial perspective—a defect perhaps of the pictures engraved, for in his works after Claude, who was a great master in this respect, the aërial perspective is well expressed.

VIVARINI, the name of a celebrated family of painters in the 15th century, of the island of Murano at Venice. The eldest of this family, the reputed Luigi Vivarini the Elder, lived about 1414, according to a picture in the church of Santi Giovanni e Paolo at Venice, inscribed with his name and this date; but as this is the only work attributed to him, Lanzi doubts whether there were two Luigis; and, as the inscription is not an autograph, he considers that there is an error in the name or in the date, and that the picture may be the work of Luigi Vivarini, called the Younger, who lived towards the close of the 15th century.

Ridolfi and Zanetti mention, after Luigi, a Giovanni and an Antonio Vivarini, or Da Murano; but Lanzi has shown that this Giovanni was a German, known as Joannes de Alemania, or Johann Alamanus. There is mention of Antonio as late as 1451; he painted several works in company with Johann Alamanus and his own brother Bartolomeo Vivarini. Some of his pictures are still in a good state of preservation; they are richly coloured, and, for the period, well drawn: there is one of these works in the Venetian Academy, inscribed 'Joannes de Alemania et Antonius de Muriano pinxit.'

Bartolomeo was a more distinguished painter; he was the first Venetian who painted what is called in oil. His first picture in this manner is dated 1473: it is now in the church of Santi Giovanni e Paolo at Venice. He painted several pictures in oil and 'a tempera,' in the Gothic style, and generally in various compartments. He painted till 1498. The National Gallery has a 'Virgin and Child' by him.

Luigi dei Vivarini the Younger was likewise a good painter for his period (1490). His master-piece is St. Jerome caressing a lion, from which some monks are flying in fear, in the Scuola di San Girolamo at Venice. In the Sala delle Antiche Pitture, in the Venetian Academy, there are several pieces by Bartolomeo and Luigi Vivarini.

VIVES, JOHN LOUIS, commonly called LUDOVICUS VIVES, was born at Valencia in Spain, in March 1492. He received his early education in his native country, and went to the University of Paris to study dialectic. He afterwards went to the University of Louvain, and there devoted himself to the study of the ancient languages, and ultimately became professor of humanity or the Latin language at Louvain. He had at Paris been a zealous disciple of the scholastic philosophy, but he had now become disgusted with it, and in 1519 he published a book against the schoolmen, entitled 'Linguæ Pseudo-Dialecticæ.' At Louvain Vives formed an intimate friendship with Erasmus and Budæus. He undertook to edit for the series of works of the fathers set on foot by Erasmus, Augustin 'De Civitate Dei;' and this edition was published in 1522, and dedicated to Henry VIII., who afterwards invited Vives over into England. Henry very soon introduced him to the court of England, and gave him the charge of the education of the Princess Mary. For the benefit of his royal pupil Vives wrote two little essays on education, published under the title 'De Ratione Studii Puerilis Epistolæ Duæ.' Vives resided, while he was in England, principally at Oxford, and was admitted to that university to the degree of doctor of laws, and read lectures on law and humanity. Henry VIII. went with his queen to Oxford, in order to be present at some of his lectures. Vives however soon lost the favour of the king by making open opposition to the divorce of Catherine of Aragon; he was put into prison by the king's order, and remained imprisoned for six months. When released, he left England, and went to visit his native country. He soon went from thence again into the Netherlands, and settled at Bruges, where he married, and devoted himself assiduously to study. The greatest number of his works were composed before this, during his residence at Bruges and his death. He died on the 6th of May 1540, at the age of forty-eight.

Vives has a distinguished place among the philosophers who, towards the close of the 16th century, undermined the hitherto supreme influence of the schoolmen, and gave an impulse to the study of classical literature. He is spoken of as having been one of a triumvirate in the republic of letters, of which Erasmus and Budæus are the two other members, all three being equally distinguished for learning and talent; Erasmus had the superiority in elegance, Budæus in wit, and Vives in soundness of judgment. The works of Vives are very numerous, and comprehend a wide range of subjects—philology, mental and moral philosophy, and divinity. Those which are best known are—'In Cansis Corruptarum Artium;' 'De Initiis Sectis et Laudibus Philosophorum;' 'De Veritate Fidei Christianæ;' and 'De Anime et Vita.' A complete edition of his works was published at Basel, in 2 vols. fol., in 1555, and another at Valencia, his birthplace, in 1782. A list of his works may be found in Nicéron, 'Mémoires pour servir,' &c., tom. xxi., p. 372.

VIVIA'NI, VINCE'NTIO, a learned mathematician of Italy, who was born of a noble family at Florence, on the 5th of April 1622. He received in that city a good general education, but having a decided inclination for mathematical researches, he applied himself diligently to the study of the ancient geometry in the works of Euclid and Pappus, and he is said to have acquired a complete knowledge of the four first books of Euclid's 'Elements' without the assistance of a teacher.

In the seventeenth year of his age Viviani became a pupil of Galilei, who was living in retirement at Arcetri, and who, though then blind and infirm, rendered him a proficient in the higher branches of mathematical science. After the death of that distinguished philosopher, he continued during several years to prosecute his studies under the direction of Torricelli, who had previously been his fellow-pupil, and for whom, as well as for Galilei, he expressed to the end of his life the highest esteem and gratitude.

Before he was twenty-four years of age he formed the project of restoring the lost treatise of Aristæus entitled, in Latin, 'De Locis Solidis,' and he actually began the work; other occupations however prevented him for a long time from proceeding with it, and it was not completed till near the end of his life, though a first edition was published in 1673, at Florence. The treatise of the Greek geometer, who was nearly contemporary with Euclid, consisted of five books, and contained the demonstrations of certain properties of the conic sections; but nothing remains of it except the enunciations of the propositions, which have been preserved in the 'Mathematical Collections' of Pappus.

Digitized by Google

The work 'De Locis' being suspended, Viviani employed some of the leisure which his duties in the service of the Grand-Duke of Tuscany afforded in the attempt to restore the fifth book of Apollonius of Perga on the conic sections, which, with the three remaining books of that writer, was then supposed to be lost. It was well known that the subject of that fifth book was the determination of the longest and shortest right lines in the conic sections; and Viviani had already made great progress in the work when, in 1656, Borelli discovered, among the manuscripts in the Laurentian Library at Florence, a translation in Arabic of the conics of Apollonius, with a Latin inscription denoting that it contained the eight books of the treatise; the last book was however wanting. Having obtained permission, he carried the manuscript to Rome, and caused it to be translated into Latin by a learned Syrian named Abrahamus Ecchellensis: this translation was published in 1659, and Viviani, who had not then completed his work, apprehending that his labours might become fruitless, obtained a certificate to the effect that he had not been aware of the existence of the manuscript, and that he was unacquainted with the Arabic language. His 'Restoration' was published in the same year, under the title 'De Maximis et Minimis Geometrica Divinatio in quintum Conicorum Apollonii Pergæi adhuc desideratum,' fol., Florence; and when the work was compared with the translation it was acknowledged that Viviani had pursued the subject beyond the point to which it had been carried by Apollonius himself.

From this circumstance Viviani immediately attracted the particular notice of his prince, and acquired a high reputation among the mathematicians of Europe. In 1672 the Grand-Duke Ferdinand gave him the title of chief engineer, and appointed him to proceed to the frontier of the Papal States for the purpose of consulting with Cassini, who was sent from Rome to meet him, concerning the new channel of the Chiana and the means of preventing the inundations of the Tiber. The measures proposed by the two mathematicians were not put in execution by the governments, but Viviani availed himself of the opportunity which his connection with Cassini afforded him of the latter in making astronomical observations, and even of carrying on some researches in natural history. In 1664, at the request of M. Chapelain, Colbert recommended Viviani to the king of France, Louis XIV., who assigned him a pension, and five years afterwards appointed him one of the foreign associates to the Académie Royale des Sciences. In 1666 he became a member of the Accademia del' Cimento at Florence, and in 1696 he was elected a fellow of the Royal Society of London.

About the year 1666 Viviani commenced a tract on the resistance of solid bodies against the strains to which they are subject, but his numerous occupations preventing him from immediately completing it, he was anticipated by Marchetti, who in 1669 published a work on the same subject. As in this work the right of Galilei to the discovery of the law of the resistance was denied, Viviani, from motives of the delay to introduce into his tract a defence of his friend and preceptor; and in every respect his work appears to have been far superior to that of his opponent.

In 1674 he published a tract entitled 'Quinto Libro degli Elementi d'Euclide, overro la Scienza Universale delle Proportioni spiegata colla Dottrina di Galilei,' to which he joined a tract designated 'Diporto Geometrico' (Geometrical Amusements), the latter consisting of the solutions, in the spirit of the ancient geometry, of twelve problems which had been anonymously proposed; and some propositions on the like kind which were proposed by Comiers having been sent to him, he published, in 1677, solutions of them in a work entitled 'Enodatio Problematum universis Propositorum à Claudio Comiers; premissis tentaminis variis ad solutionem illustris vestrum problematis de anguli trisectione.' This work is dedicated to the memory of his friend Chapelain; and in the preface he expresses a distaste for such challenges, observing that the problems are enigmas which are seldom proposed except by persons who have previously discovered their solutions; yet fifteen years afterwards he proposed as a challenge to the mathematicians of Europe a problem whose enunciation was fancifully stated in the following manner:—"Among the ancient monuments of Greece, there is a temple dedicated to geometry; its plan is circular, and it is covered by a hemispherical dome, in which are four equal apertures of such magnitude that the remainder of the superficies is accurately quadrable: it is required to determine the magnitude and the positions of the apertures." The challenge appeared in the 'Acta Eruditorum,' under a designation which is an anagram of the words 'A postremo Galilæi Discipulo,' a title of which Viviani appears to have been always proud. Solutions were almost immediately given, by the aid of the infinitesimal calculus, by Leibnitz and James Bernoulli in Germany, by the Marquis de l'Hôpital in France, and by Wallis and David Gregory in England: the solution given by Viviani himself is very simple, and it was published without a demonstration, in a small work entitled 'Formazione è Misura di tutti I Cieli, con la Struttura e Quadratura esatta d'un nuovo Cielo ammirabile,' 4to, Firenze, 1692.

In 1701 he published, at Florence, a second and enlarged edition of his restitution of Aristæus, under the title 'De Locis Solidis Secunda Divinatio Geometrica in Quinque Libros amissos Aristæi Senioris, Opus Conicum, continens Elementa Tractatum ejusdem Viviani, quibus tunc ijse multa in Mathesi Theoremata demonstrare cogitaverat.' The work is dedicated to Louis XIV., and the author avails himself of the occasion to express his gratitude to his preceptor Galilei. The subject is treated with great elegance and simplicity, and according to the methods of the ancient geometers; it must be admitted however that the difficulty of the work would have been much diminished by the employment of the modern analysis.

Viviani was solicited by Casimir, king of Poland, to reside in that country; but from attachment to his native land, he declined the request, as he did the offer of Louis XIV. to make him his first astronomer. He built for himself, at Florence, a mansion, on the front of which he inscribed the words, *Edito a Deo datur*; and from respect to the memory of Galilei, he adorned the entrance with the bust of that philosopher. He died on the 22nd of September 1703, in the eighty-second year of his age, leaving behind him the character of having been a man of simple manners and a faithful friend.

(*Éloge de Viviani*, by Fontenelle, in the 'Histoire de l'Académie des Sciences,' for 1703.)

VLACQ, ADRIAN, a Dutch mathematician of the 17th century, who distinguished himself by his labours in the computation of logarithms. Being a bookseller or printer, he superintended the printing of the tables which he had composed, as well as of almost the first of those which were computed by the mathematicians of this country.

Logarithms had then been recently invented, and while the employment of them was becoming general in Britain through the labours of Briggs, Gunter, and other indefatigable computers, Vlacq in Holland contributed greatly to extend their use and a knowledge of the principles of their construction on the Continent. In 1628 he published at Gouda an edition of the 'Arithmetica Logarithmica' of Briggs, which contained the logarithms of numbers between 1 and 20,000, and between 90,000 and 100,000, to fourteen places of decimals; but having computed the logarithms of the 70,000 intermediate numbers, he published at the same place, in folio, a French translation of the above work, including in it the seventy chiliads, under the title of 'Arithmetique Logarithmétique:' all the logarithms are given to ten places of decimals. It appears that part of the edition of the 'Arithmetica Logarithmica,' which had been published by Vlacq, was sold in England, contrary to the intention of the author; for Norwood, in his 'Trigometra,' which was published in 1631, complains of such an act, and disapproves of such unfair practices.

Briggs having just before his death completed his great table of logarithmic sines and tangents, his friend Gellibrand wrote for it a preface and an account of the application of the logarithms to the purposes of plane and spherical trigonometry. This work, which was designated 'Trigonometrica Britannica,' was printed at Gouda by Vlacq in 1633. In the same year Vlacq printed a work, composed by himself, which is entitled 'Trigonometria Artificialis, sive magnus canon Triangulorum Logarithmicus, ad dena scrupula secunda,' &c.; it contains the logarithmic sines and tangents to ten places of figures, with differences, and to these is added Briggs's table of the first 20,000 logarithms with their applications, chiefly extracted from the 'Trigonometrica Britannica.'

In 1658, Vlacq published an abridgment of the 'Trigonometria Artificialis,' under the title of 'Tabulæ Sinuum, Tangentium, et Secantium, et Logarithmorum Sinuum, Tangentium, et Numerorum ab 1 ad 10,000,' in 8vo. These tables have passed through several editions in French and German, and on the Continent they continued long to be a manual for persons employed in making trigonometrical computations.

VLADIMIR (the First), Grand-Duke of Russia, surnamed the Great, was the son of Sviatoslev by a slave, or at least a woman of low condition.

His father, meditating the conquest of Bulgaria, divided in 970 his empire between his two legitimate sons Yaropolk and Oleg. Vladimir was sent to Novgorod, as that unruly place, disdained by the legitimate princes, was considered a government only fit for an illegitimate son. After Sviatoslev's death, 972, his sons remained at peace for five years; but in 977 Yaropolk, who ruled at Kiev, quarrelled with his younger brother Oleg, and having slain him in battle, took his share of the paternal heritage. Vladimir, expecting an attack from his brother, fled beyond the sea to the Varingians (i.e. the Scandinavians), and Yaropolk occupied Novgorod by his officers.

Vladimir returned after two years from Scandinavia with a formidable body of adventurers, and was joined by the inhabitants of Novgorod. He formally declared war against his brother, and demanded the hand of Rogneda, daughter of the Varingian Rogvold, prince of Polotsk. Rogneda, who was betrothed to his brother, rejected Vladimir's suit, saying that she would not marry the son of a slave. Vladimir attacked Polotsk; Rogvold was killed with his two sons, and Rogneda was compelled to marry Vladimir.

Vladimir marched on Kiev, and Yaropolk, perceiving that he was betrayed by his own people, fled from his capital, but being soon afterwards induced to surrender, he was treacherously murdered by his brother's command. Vladimir now became monarch of the empire of his father, which extended from the vicinity of the Baltic to that of the Black Sea. It was however by no means a regularly constituted empire, like that of the western monarchs of that time. The sovereignty of the grand-dukes of Russia, who had established their capital at Kiev, was limited to a tribute levied on the various Slavo-

Digitized by Google

nian and Finnish populations spread over the immense tract of land which they considered as subject to their rule. This tribute was levied either by the sovereigns themselves, who travelled for that purpose about the country, or by their delegates; and their authority was respected only where they had a sufficient force to maintain it. Vladimir established a more regular and efficient system of government. He subjected all the populations which had recovered their independence during the preceding reign, and built many towns in order to maintain them in subjection. He also seems to have conceived the idea of cementing his vast and heterogeneous empire by the powerful bond of a religious centre, and he erected at Kiev the idol of Perunn, the supreme divinity of the Slavonians, and those of the inferior deities, Khors, Dajbog, Stribog, Semargla, and Mokosh. The first three of these deities were Slavonian, and the last two Finnish, a circumstance which seems to imply the notion of uniting the religious worship of the two different races. To these deities were offered human sacrifices, chosen by lot, and the chronicles relate that two Christian Varingians, father and son, fell victims to that bloody superstition.

Vladimir got rid of his Scandinavian allies by persuading them to pass into the service of the Greek emperor, and endeavoured to effect an amalgamation between the Varingians and the Slavonians. He gave continual entertainments to his subjects, and the memory of the splendour of his court is still alive in the popular songs of Russia.

The Chronicles, which extol Vladimir's wisdom and valour, accuse him of great laxity of morals. Besides Rogneda, he had married the widow of his brother Yaropolk, a beautiful Greek nun, who was a captive of their father, and three other wives. He had a great number of concubines who lived in different places; as, for instance, at Vishgorod 300, at Belgorod the same number, at Berestov 200, and no woman in the country was secure from him. If such were really the case the Chronicles have reason to say that he was fond of women, like Solomon.

Kiev had already for more than a century frequent intercourse with Constantinople, where Vladimir's grandmother Olga was baptised in 955. Her example, though it had not been followed by her son, found many imitators among his subjects, and the trade which was carried on between these two cities had undoubtedly attracted many Greeks to Kiev. It was also natural that missionaries of the Western church should be attracted by the renown of Vladimir from Poland and Germany. The Bulgarians, a Mohammedan nation, inhabiting the banks of the Volga, in the present government of Kazan, and celebrated for their commercial spirit, had, after a short war, concluded a solemn treaty of peace with Vladimir, and the powerful nation of the Khasars, which occupied the country between the Caspian and Black Seas north wards to the Caucasus, and bordering on Vladimir's empire, contained many Jews; even the kinga had for some time followed the Jewish religion, although at the time of Vladimir they were Christians. This will explain the circumstance that all these religious professions tried to convert Vladimir to their respective creeds. It is said that the polygamy permitted by the Khoran and the sensual paradise promised to its disciples had greatly pleased him, but that he would not consent to give up wine. The religion of the Jews, who were exiles from their own country, could not prodnce a favourable impression upon a warlika prince. The Greek church, which already numbered many converts in Russia, had a great advantage over that of Rome, whose missionaries were strangers in that country, and Vladimir answered the exhortations by saying that "Our ancestors have not known yon." When Vladimir consulted his nobles on the same subject, the answer which they gave him was, "If the Greek religion was not good, thy grandmother Olga would not have adopted it."

Besides this circumstance Vladimir had motives of ambition which prompted him to become a convert to the Eastern church. This was a matrimonial alliance with the imperial house of Constantinople, which was then generally sought by the rulers of the barbarian nations bordering on the empire. In order to insure the success of his object, he began by an attack on the frontiers of the empire, and having besieged the important town of Cherson in the present Crimea, he demanded the hand of the Princess Anna, daughter of the Emperor Romanus the Second, and sister of the then reigning Emperors Constantine and Basilius, and of Theophania, empress of Otho the Second of Germany. He promised, if his request was granted, to receive baptism with all his subjects, and to become an ally of the empire, which he threatened with war in case of a refusal. His demand was granted; he was baptised with his followers at Cherson, and married the Greek princess in 988. He immediately applied himself with great zeal to the establishment of Christianity in his dominions; all the idols were destroyed by his orders, and the inhabitants were baptised in crowds. He built churches, established schools, and his exertions were greatly facilitated by the circumstance that there was already a Slavonian version of the Scriptures by Cyrillus and Methodius, as well as liturgical works in the same language. An ordinance on the ecclesiastical tribunals, taken from the Greek Nomocanon, was published by Vladimir, and he became so strongly penetrated with the spirit of Christian meekness, that he would no longer punish with death even the greatest criminals, and was content to fine them. This ill-judged lenity produced great disorders, and the clergy themselves were obliged to remonstrate against it, and to induce Vladimir to restore public order by capital punishments. He is said to have entirely amended his former licentious manners, and his charity to the poor was unbounded. He divided the government of his empire among his eleven sons, whom he had by several wives, and his stepson Sviatopolk, with whom his murdered brother's widow was pregnant when he married her. After his conversion he had some wars with his neighbours, but they did not produce any consequences; and his reign was chiefly spent in promoting the civilisation of his subjects, for which he received ample means from Constantinople, then the only seat of arts and literature in Christian Europe.

The end of his life was disturbed by the growing spirit of liberty at Novgorod. The citizens of Novgorod refused to pay the annual tribute sent by that city to Kiev. His son Yaroslav, who was established by him at Novgorod, took the part of the inhabitants, at least he did it apparently, as some suppose. Vladimir assembled an army in order to coerce his refractory subjects, but he died on his march not far from Kiev, in 1014. His wife Anna died in 1011, as it seems without issue. The Russian church has placed him amongst her saints, and given him a rank equal to that of the apostles.

VLADIMIR MONOMACHOS, grand-duke of Kiev, is one of the most remarkable persons of the middle ages, whose life and writings present an interesting picture of the social state of Russia during the 11th and 12th centuries. He is extolled by the Chronicles as a most virtuous prince, and considered by them almost a saint. He was undoubtedly a man of superior character and abilities, but by no means free from the faults of his barbarous age.

Vladimir was born in 1052. He was the son of Vsevolod, the grandson of Vladimir the Great. The division of the empire made by the latter among his grandfather Yaroslav the Great, in 1054, produced constant wars among his successors, who continued to subdivide their heritages among their children. By the same arrangement of Yaroslav the sovereignty over all the other princes belonged to the grand-duke of Kiev, who succeeded to that dignity, not according to the law of primogeniture, but according to that of seniority, or as being the eldest of all the princes of Russia. This arrangement, customary at that time with all the Slavonian nations, led unavoidably to quarrels among all those who either had any right to or possessed the means of claiming the throne of Kiev. This unfortunate state of Russia was rendered still worse by the appearance of the Polovtzee, or Comans of the Byzantines, a nomadic nation, who arrived from the deserts of Central Asia, and encamped in the country extending northward from the shores of the Black Sea and that of Azoff, about the middle of the 11th century. These nomadic people made continual inroads into the territories of the Russian princes, but were also frequently employed by them as auxiliaries in their internal and foreign wars. Vladimir made his first campaign under his relative Boleslav II., or the Dauntless, king of Poland, whom he joined with an auxiliary force in an expedition against Bohemia in 1076. He afterwards took a part in the domestic quarrels among the Russian princes, and received from his father, who became grand-duke of Kiev in 1078, the principality of Chernigoff, which was the lawful heritage of his cousin Oleg, having on a former occasion obtained, in an equally illegal manner, that of Smolensk, which was given him by the father of the same Oleg whom he now spoiled. This circumstance created a deadly hatred between the two cousins, established an hereditary feud between their descendants, and entailed for a long time great disasters on the country. Having taken during these wars the town of Minsk, he did not spare "either man or beast;" and when his cousin Oleg was marching with the Polovtzee to recover his principality, Vladimir bribed those barbarians, who carried back the prince whom they came to assist as a captive, and murdered his brother. He also compelled the legitimate prince of Novgorod to cede it to his son, and to content himself with a small principality. This proves that he was no more scrupulous than his contemporaries in the means of attaining his objects.

Vsevolod died in 1093, but Vladimir, who was the real sovereign during the reign of his father, did not venture to break the law of seniority, and he called to the throne of Kiev his cousin Sviatopolk, prince of Turov, the eldest of the family. Sviatopolk confirmed the possessions usurped by Vladimir during his father's life; but both these princes being defeated by the Polovtzee, Oleg, who since his expulsion had lived in exile, chiefly in Greece, returned to the country, and compelled Vladimir to restore Chernigoff and Smolensk to him and his brother. The differences among the princes were settled by a congress held at Lubech and at Kiev, on which occasions Vladimir displayed, in the prosecution of his interests, great diplomatic talents. He also defeated, with the assistance of other princes, the terrible Polovtzee on several occasions, by which he secured for some time the country from their devastations, and justly acquired great popularity. In 1112 he became, on the death of Sviatopolk, grand-duke of Kiev, being already sixty years old. He reigned thirteen years till 1126, and he proved himself during this time a really great prince. Internal peace was maintained by his authority, and foreign enemies were repelled with uninterrupted success. New towns were built, old ones improved, and the country enjoyed general peace and prosperity. He died at Kiev May 19, 1126.

His character, his views, and his principles are displayed by his testament, or his last instructions to his children, which also gives an

Digitized by Google

insight into the manners, the state of civilisation, and the prevailing opinions of that period.

After having expatiated on the glory of God, chiefly in words taken from the Psalmist, he says, "O my children! love God! love also mankind! It is neither fast, nor seclusion, nor monastic life which may save you, but good works. Do not forget the poor; feed them, and think that all goods belong to God, and are entrusted to you only for a time. Do not conceal treasure in the bowels of the earth, for this is contrary to the Christian religion. Be fathers to the orphans; judge yourselves the widows, and do not permit the stronger to oppress the weaker. Do not take the life either of the innocent or of the guilty; the life and the soul of a Christian are sacred." He then recommends them to keep their oaths, to respect the clergy, to avoid pride and every kind of profligacy, and continues—"In your household look yourselves to everything, without relying on your stewards and servants, and the guests will not find fault either with your house or with your dinner. In time of war be active and be an example to your officers. It is not then the time to think of banquets and enjoyment. Repose after having established the nightly watch. Meu may suddenly perish, therefore do not lay aside the armour where danger may happen, and mount your horses early. Above all, respect a stranger, be he a great or a common man, a merchant or an ambassador; and if you cannot give him presents, satisfy him with meat and drink, because strangers spread in foreign countries good and bad report of us. Salute every one whom you meet. Love your wives, but give them no power over yourselves. Instruct them in every good thing which you have learnt, and learn what you do not know. My father, having never been abroad, spoke five languages, for which we are praised by foreigners." This is certainly a curious fact, and which perhaps was not common at that time in Western Europe. The languages alluded to were probably the Greek—as the higher clergy, who had the education of the princes, were generally of that nation—the Scandinavian, the Slavonian of Russia, and perhaps the Hungarian, and that of the Polovtzee, with whom the Russians were in daily intercourse. It is also not unlikely that Latin, which was cultivated by the learned Greeks, was one of the languages alluded to. "Avoid idleness, it is the mother of all vices. On a journey on horseback, when you have no occupation, instead of indulging in idle thoughts, repeat prayers, at least the shortest and the best of them—'Kyrie eleyson.' Never go to sleep without an earthly prostration; and when you do not feel well, do it three times. Rise before the sun, and go early to church. So have done my father and all the good men. After which they held a council with their officers, or judged the people, or went to hunt; and at midday they slept, because God has assigned the midday hour for repose, not only to man, but also to animals and birds." It is remarkable that this habit is still prevalent among the common people in Russia. "Your father lived also in that manner. I have myself all that I could have, and ordered a servant to do it in hunting and in war, at day and at night, during the heat of summer, and the cold of winter, I have not known any repose. I have never relied on magistrates and officers. I never allowed the poor and the widows to be oppressed by the strong. I superintended myself the church, the Divine service, the household, the stables, the hunt, the hawks, and the falcons." Having enumerated his various feats of arms, he says, "I have undertaken eighty-three expeditions, without mentioning many insignificant ones. I have concluded with the Polovtzee thirteen treaties. I took prisoners more than a hundred of their best chieftains, whom I released afterwards, and I punished and drowned in rivers more than 200 of them. Who travelled more rapidly than I did? On leaving Chernigoff in the morning, I arrived at Kiev, where my father was, before vespers (a distance of 100 English miles). I was fond of sports; I once hunted wild animals with your grandfather. Amidst thick forests I have bound with my own hands several wild horses at once. I was twice tossed on the horns of a buffalo; a deer struck me with his horns, and an elk trampled me under his feet; a wild boar tore the sword from my side; a bear bit through my saddle, and a wild animal attacked and overthrew the horse which I rode. How many times have I fallen from my horse! I twice broke my head, and many times injured my arms and legs, sparing not my life during my youth. But the Lord has watched over me. And you, my children, do not fear death, nor combat, nor wild animals; but act as men on every occasion which may come from God. When Providence has decreed a man's death, neither his father, nor his mother, nor his brethren may save him." It is very probable that the observation of the rules of prudence and external piety laid down in these instructions greatly contributed to the establishment of his reputation.

Vladimir was surnamed Monomachos by his mother, a daughter of the Emperor Constantine IX., Monomachos. His first wife was Gyda, daughter of Harold, the last Saxon king of England, who had found, after the death of her father, a refuge at the court of Swen II., king of Denmark. Marriages between the Russian princes and those of Western Europe, particularly of Scandinavia, were very common during that period. Thus Vladimir's aunts were married to Henri I. of France, and to Harold-Hardrade, king of Norway, who perished in 1066, at the battle of Stamford Bridge. The celebrated Danish king Waldemar I. was the son of one of his grand-daughters, and probably received his Slavonian name in honour of his ancestor. After the death of Gyda he was twice married, but the Chronicles do not mention the names of his wives.

The crown used at the coronation of the monarchs of Russia is called the golden cap of Monomachos, and is supposed to have been presented to Vladimir, with the sceptre and some other regalia used on the same occasion, by the Greek Emperor Alexius Comnenus, as having belonged to his grandfather Constantine Monomachos. These objects are undoubtedly of Byzantine workmanship, but the history of their origin is considered by many as a modern invention made during the 16th century, when Ivan III., of Moscow, having married the Greek princess Sophia Palaeologus, assumed the pretensions of a successor to the emperors of the East.

VOET, GISBERT, the father, and Paul and Daniel, the sons, and John, the grandson, were distinguished members of the University of Utrecht, in the 17th century.

GISBERT VOET was born at Heusde on the 3rd of March 1593; he studied at Leyden, with the character of a young man of great promise; and having taken orders, discharged the functions of minister in his native town till 1634. In that year he was appointed professor of theology and Oriental languages in the seminary of Utrecht, which was converted into a university two years later. Voet became the zealous advocate of the doctrines adopted by the Synod of Dort, nor did his controversial predilections confine themselves to this narrow field. He attacked vehemently the philosophy of Descartes, whom he designated alternately an atheist and a Jesuit, and whom he even went the length of accusing before the civil magistrate. His controversies with Cocceius, professor at Leyden, divided the Dutch theologicians into Voetians and Cocceians. In short no polemical adversary came amiss to him: Roman Catholic, philosopher, Arminian—he was ready to break a lance with any man who chose to put subscribe to the Calvinistic creed. He had on his arms at once Descartes, Wolzogen, Regius, Schoockius, Dumoulin, Cestergs, &c. The incessant excitement of controversy appears to have agreed with him, for he lived to the advanced age of eighty-seven, dying in 1680, outliving by several years all the other members of the Synod of Dort. A full list of his numerous publications, chiefly works of polemical theology, is given by Gaspar Burman, in his 'Trajectum Eruditum:' the principal are, 'Selectæ Disputationes Theologicæ,' Utrecht and Amsterdam, 5 vols. 4to, 1648-59; and 'Politica Ecclesiastica,' Amsterdam, 4 vols. 4to, 1663-76.

PAUL VOET was born at Heusde, on the 7th of June 1619. He taught, at different times, logic, metaphysics, Greek, and civil law in the University of Utrecht. He published in 1654 a Harmony of the Gospels; and in 1655-57, 'Theologia Naturalis.' Many of his juridical works the most valuable, at least that which has carried with it the greatest authority, is the treatise 'De Statutis eorumque Concursu.' His other legal publications are—'De Duellis Licitis et Illicitis,' Utrecht, 1646; 'De Usu Juris Civilis in Canonicis Imprimis Unito,' Utrecht, 1657, 'Disquisitio Juridica de Mobilibus et Immobilibus,' Utrecht, 1666, 'Commentarius ad Institutiones Juris,' Gorcum, 1668. It is in part owing to the time at which he lived, rendering his works the text-books of the young Scotch lawyers, the contemporaries of Stair and Mackenzie, that we find him so frequently quoted by the ablest Scotch lawyers previous to the commencement of the present century. Paul Voet published, in Dutch, a history of the family of Brederods, which has been translated into French; some controversial pamphlets defending his father; and notes on Musæus, Callimachus, and Herodian. He died on the 1st of August 1677.

DANIEL VOET, son of Gisbert, and brother of Paul, was born at Heusde on the 31st of December, 1629, and died at Utrecht on the 26th of July, 1660. He was professor of philosophy at Utrecht. He published several text books: his 'Meletemata Philosophica,' and his 'Physiologica, sive de Rerum Natura Libri vi.,' appeared at Amsterdam the year after his death, and were republished, with notes by Vries, in 1668.

JOHN VOET, the son of Paul, was born at Utrecht on the 3rd of October, 1647. He was professor of law at Herborn, afterwards at Utrecht, and ultimately at Leyden, where he died on the 11th of September 1714. His most esteemed work is his 'Commentarius in Pandectas,' published at Leyden in 1698, in 2 folio volumes. In 1670 he published a tract 'De Jure Militari;' in 1678 another, 'De Familiæ eriscundæ;' and in 1683, at Leyden, a 'Compendium Juris.' He too, as well as his father, took the field in defence of Gisbert, the founder of the family.

PAUL ERASMUS VOET, inspector of the ootrois at the Hague, and a Dutch physician, born about 1705. He is mentioned with praise as a poet in Vries's history of Dutch poetry. His poems are lyrical in their form, and rather mystical in their contents. It does not appear that he belonged to the same family as the theologian, the jurists, and the philosopher. He died September 28, 1778.

VOGEL, DR. EDWARD. The notice of OVERWEG, DR. ADOLF, contains also notices of Mr. Richardson, Dr. Barth, and Dr. Vogel, who were all employed in the same expedition from the coast of the Mediterranean to Central Africa. We are now enabled to state a few facts by way of addition and correction to the information there given. Dr. Barth was born May 19, 1821, at Hamburg, where he was educated. He afterwards studied at the university of Berlin. Dr. Barth, since his return, has published 'Travels in Central Africa,' 3 vols. 8vo,

Digitized by Google

comprising the earlier portion of his explorations, which are to be followed by two other volumes, completing the work, and including the account of his long residence in Timbuctoo. The notes from which these interesting and valuable volumes have been composed were written down daily, often under great difficulties, privations, and dangers, and were afterwards copied as soon as an opportunity occurred. Dr. Edward Vogel was born March 7, 1829, at Leipzig, where his father, Dr. Carl Vogel, was master of one of the principal schools. He was educated at Leipzig, and afterwards studied astronomy at Berlin under Professor Encke. He resided in London about two years at Mr. Bishop's Observatory, Regent's Park. In the early part of 1857 a despatch received by the British government enclosed a copy of a letter from Corporal Maguire to the British consul at Tripoli, dated Kuka, November, 1856, announcing the reported assassination of Dr. Vogel in the kingdom of Wadai. Corporal Maguire was one of the two volunteers from the corps of Sappers and Miners, who accompanied Dr. Vogel to Central Africa, and he then stated that he was coming home with the observations and instruments. A paragraph in 'The Times' newspaper, of the date of August 21, 1857, states that "the official confirmation of the murder of Dr. Vogel, at Wara, the capital of Wadai, has just been received. He was beheaded by order of the Sultan. Corporal Maguire was murdered by e party of Tuaricks some six miles to the north of Kuka." Thus has terminated, if these accounts prove to be authentic, the last expedition from the shores of the Mediterranean to Central Africa, and of those who composed it, young and healthy men, Dr Barth alone remains alive.

VOGEL, THEODOR, a botanist of great promise, who perished in the expedition to the Niger, in the year 1841. He early devoted himself to the study of botany, and was a student at the University of Berlin, where he took his degree of doctor of philosophy. One of his earliest contributions to botanical science was a paper published, conjointly with Dr. Schleiden, on the development of albumen in leguminous plants. This paper bears the high character of all the later labours of Dr. Schleiden, and at the same time affords evidence that Vogel belonged to that school of physiological botanists who, from their minute knowledge of structure, are doing so much at the present day for the advancement of scientific botany. In a subsequent paper, entitled a 'Monograph of the Genus Cassia,' Vogel displayed his intimate knowledge of structure, as well as his powers of observation, in unravelling the intricacies of that difficult genus of plants. In 1840, when it was determined to fit out an expedition to Africa, Captain Washington visited Germany for the sake of gaining co-operation, and Vogel was there recommended to him as a botanist likely to be of great service in the expedition. Vogel, who was then at Bonn, in the university of which place he had been appointed a teacher of botany, no sooner had the offer made him than he anxiously embraced it as affording him an opportunity of pursuing his favourite science in an unexplored region. After having visited England, where his knowledge of botany excited in the minds of those who knew him the warmest interest for his prosperous return, he sailed with the expedition for Africa, in July 1841. The disastrous events of that ill-fated expedition are well known. Vogel was early sufferer from the fever which carried off the majority of those who sailed, and although he recovered so far as to be able to reach Fernando Po, he sunk there from the effects of dysentery about six months after the time he had sailed from this country. He made the best use of the little time that he had health to collect plants on the coast of Africa, and his death seems to have been hastened by his anxiety to arrange and study them whilst in a convalescent state at Fernando Po. He was buried by the side of Captain Bird Allen, another of the unfortunate victims of this expedition.

VOISENON, CLAUDE HENRI FUSÉE DE, was born at the Château de Voisenon, near Melun, on the 8th of January 1708. He was a younger son, and his delicate constitution rendering him unfit for a military career, his parents made him enter the church.

The future priest made his literary debût by addressing in his eleventh year a poetical epistle to Voltaire, who complimented the author in return. A dramatic piece in one act, 'L'Heureuse Ressemblance,' which he produced in his twentieth year, meeting with a favourable reception, encouraged him to write for the stage. Three pieces, 'L'Ecole du Monde,' 'L'Ombre de Molière,' and 'Retour de l'Ombre de Molière,' were brought upon the stage by him with varying success. About this time he was involved in a duel with an officer whom he had offended by some joke. Hitherto Voisenon had refused to comply with the wish of his family that he should take orders: the conviction that he was in fault in this quarrel, and had wounded his innocent antagonist, pressed so heavily on his mind, that he entered a seminary. He was barely ordained, when his relative M. Henriet, bishop of Boulogne, appointed him grand-vicar. On the death of the bishop, in 1741, the see was offered to Voisenon, who declined it, on the ground that he who was unable to control himself was unfit to manage a bishopric. Cardinal Fleury, pleased with this disinterestedness, bestowed upon him the abbey of Jard, in which residence was not required. Voisenon, thus made possessor of a competency, gave himself up for the rest of his life to the world and its pleasures.

Voltaire introduced him to the Marquise du Chastelet. The wits who frequented the houses of the Comte de Caylus and the actress Quinault Dufresne received him with open arms. The Duc de la Vallière eagerly sought his company. His former success in writing for the stage led his friends to wish that he would resume his pen; but two years elapsed before the entreaties of Mademoiselle Quinault could overcome the misgivings of the 'ancien grand-vicaire' of Boulogne. She triumphed at length, and the 'Mariages assortis,' a comedy in verse, in three acts, was produced at the Italiens in 1744.

From 1744 to 1755 he composed a number of plays, of which 'La Coquette fixée,' which had a run of twenty-three successive nights, was the best. He produced on the stage or in print operas, oratorios, profane and licentious lyrics, and at least one religious tract. In the midst of his dissolute life Voisenon was haunted incessantly with religious scruples. His naturally weak constitution broke down at last under his libertine indulgences. Apprehensive of death, he made a general confession: his confessor refused him absolution: Voisenon appealed to the pope, and with some difficulty, after paying a thousand crowns, and engaging to repeat his bravery every morning, he was absolved. He kept his promise, but the regularity of his devotion contrasted strangely with the equal regularity of his dissipation.

In 1762 he became a candidate for admission into the Académie: he was elected, and delivered his inaugural address on the 22nd of January 1763. He attended the meetings of that body with punctuality, and his wit and liveliness made him a favourite. In 1766 he was deputed to do the honours of the Academy to the Duke of Brunswick, and in 1768 to the King of Denmark. In 1771 he was the director who admitted M. Roquelaure, bishop of Senlis, and a few days later the prince of Beauveau and the historian Gaillard. On all these occasions he gave free vent to his petulent wit. His face and figure, which have been compared to those of an ape, pointed his jests, and these solemnities elicited peals of laughter from the audience.

Notwithstanding his effrontery, the Abbé Voisenon lived long without enemies. He was perfectly good-natured, and appears to have acted among his irritable associates the part of a reconciler-general. He lost himself however after the fall of the Duc de Choiseul, who had patronised him, by his servile flattery of Madame du Barry and his ungrateful sarcasms against his former benefactor. Voisenon's friends fell off from him in disgust. The Duke of Orleans refused to receive, and the Prince of Conti turned his back upon him. He was insulted and hissed at the meetings of the Academy, and to his paternal château, where he died on the 22nd of November 1775.

Besides his dramatic pieces and fugitive poetry, Voisenon published a number of tales, 'Anecdotes Littéraires,' and 'Fragmens Historiques,' which Madame de Furpin, whom he accustomed to call his secretary, was his literary executor. She published the complete works of Voisenon, prefaced by an eulogistic biography, in five 8vo volumes. Labarpe, who said that these volumes reminded him of a butterfly crushed in a folio, published a selection, in one small volume, in 8vo. There is both point and elegance in the wit of Voisenon, though his mind was scarcely vigorous enough for a work of any extent. Notwithstanding his libertinism, he was unostentatiously benevolent, and on some occasions self-denying. His disgraceful devotion towards the Duc de Choiseul may be charitably ascribed to dotage.

VOITURE, VINCENT, a French writer in prose and verse, formerly of great reputation, was a native of Amiens, where he was born in 1598. His father was a wine-merchant, but, besides being a lover of good cheer, was an attendant upon the court, and well with all the principal people there. Voiture himself was educated at Paris: two poems by him, one in Latin, the other in French, on the assassination of Henry IV., were published in a collection of pieces by members of the College of Calvi, in 1612; the same year appeared his 'Hymnus Virginis, seu Astreæ;' and it was at the College de Bourgogne that he made the acquaintance of M. d'Avaux, who afterwards, when he became superintendent of the finances, gave his friend the valuable place of one of his first clerks, making it at the same time a sinecure, the better to suit Voiture's tastes and habits. It is said to have been at the celebrated hotel of Madame de Rambouillet, where he was introduced by M. de Chaudebonne, that his wit and talent were first appreciated: Mademoiselle de Rambouillet is the Madame de Montausier who is so frequently celebrated in his letters and verses. He soon became a distinguished figure at court; and he spent the rest of his life in the society of the great, occasionally visiting foreign countries on some court mission. He appears to have been in England in 1633; one of his published letters in that year is dated from Douvres. Before this he had been in Spain, where he was received with great distinction, and where he delighted the literary and fashionable circles of Madrid by penning verses in their own language, of such purity and apparent facility of style, that they were at first universally ascribed to Lope da Vega. From Spain he proceeded to Africa, to satisfy his curiosity by a view of that coast. He is stated to have paid two visits to Rome; and in 1638 he had the honour of being sent to Florence to announce to the grand-duke the birth of the dauphin, afterwards Louis XIV. Among the places he enjoyed at court were those of maître d'hôtel to the king, and introducteur des ambassadeurs to the Duke of Orleans. He was elected a member of the French Academy in 1634, and of that of the Umoristi at Rome in 1638. He died May 26, 1648.

With the exception of the early pieces already mentioned, and

Digitized by Google

some stanzas addressed to Gaston of Orleans in 1614, Voiture printed nothing in his lifetime; but his French writings were collected after his death, and published at Paris in a quarto volume in 1650, by his nephew M. Etienne Martin de Pinchesne; and they have since been often reprinted. They consist of letters, poems, and a portion of a prose romance entitled 'L'Histoire d'Acidalie et de Zélide.' His Latin verses were first added in an edition of his works published at Paris, in 2 vols. 12mo, in 1729. He is also said to have written easily and correctly in the Italian language, as well as in French and Spanish. In his own day, and for a long time after, Voiture was universally regarded as the model of grace and spirit in writing; the introduction of more recent criticism has generally been to depreciate him, perhaps unduly. Voltaire remarks ('Siècle de Louis XIV.') that he was the first example in France of what is called a bel-esprit; but that his writings have scarcely any other merit. He admits however that that sort of merit was then extremely rare; and he adds that some of Voiture's verses are very fine, though those deserving to be so styled are but few. The Abbé de Castres ('Siècles Littéraires') allows that some of his letters still may be read with pleasure, but not the whole continuously. He complains that the wit is too ambitious and manifestly elaborate, as well as lavished with such prodigality as to dazzle and fatigue more than to please. The writer's constant affectation, the Abbé conceives, is such as to deprive him of all the charm of nature and variety. On the other hand our own Pope, in a finished encomium on Voiture, sent along with a copy of his works to his friend Miss Blount, has said—

> "His easy art may happy nature seem;
> Trifles themselves are elegant in him."

De Castres admits nevertheless that Voiture does not merit all the contempt which it had come to be customary to express for him; and that few writers furnish more examples of fineness and delicacy of thought. Boileau was an ardent admirer of Voiture, and has celebrated him as the great example of elegance of style in the preceding age. He must indeed be regarded as one of the reformers of French poetry—which he had the taste to seek to restore to the simple and cordial style of Marot from the pedantry and affectation into which it had subsequently degenerated; adding at the same time a polish and comparative exactness till then unexampled. He may in this way be considered as the founder of the style which was afterwards carried to perfection by La Fontaine. We had certainly nothing so good of the same kind in English poetry at Prior appeared. In his prose, his wit is often very brilliant and happy, and the diction is probably more flowing and regular than that of any preceding French writer. A conclusion to Voiture's unfinished romance has been written by the Sieur des Barres: it first appeared by itself at Paris in 1677; and it may be seen in an edition of his 'Lettres et autres Œuvres,' 2 vols. 12mo, Amsterdam, 1709, although the 'Biographie Universelle' says it was first published along with Voiture's romance in the Paris edition of 1713. There are at least two English translations of Voiture's Letters: one entitled 'Letters of Love, and Gallantry,' &c., written to several persons of honour and quality by the exquisite pen of M. de Voiture; Englished by J. D.' (i.e. J. Davies, as appears from the dedication), 2 vols. 8vo, London, 1657; the other, entitled 'The Works of Monsieur Voiture, Translated by Mr. Dryden, Mr. Dennis, Dr. Drake, Mr. Cromwell, Mr. Cheke, Mr. Brown, Mr. Ozell, Mr. Webster: the third edition, revised and corrected throughout by the last edition printed at Paris, addressed to Miss Blount by Mr. Pope,' 2 vols. 12mo, London, 1736. But this is one of Curll's lying title-pages, and the book contains a translation only of a very few of Voiture's poems. Among the translations however is one attributed to Pope, which could scarcely have been written by any one else ('Verses occasioned by Mr. Durfy's adding an &c. at the end of his name, in imitation of Voiture's verses on Neuf Germain'). In this translation of the letters does not seem to be so good as that by Davies. Some of the best of Voiture's poems, preceded by a short sketch of his life, with several curious anecdotes illustrative of his character and habits, may be seen in the 54th volume (pp. 193-258) of the collection entitled 'Recueil des plus belles Pièces des Poètes François,' 6 tomes, 12mo, Paris, 1752. So lately as in 1806 there was published at Paris, in 2 vols. 12mo, a collection entitled 'Lettres Choisies de Voiture, Balzac, Montreuil, Pelisson, et Boursault.' The letters are preceded by a preliminary discourse and a biographical account of the writers; both anonymous, but known to be, the former by M. Vincent Campenon, the latter by M. Anger; and several both of his Letters and Poems are given in a 12mo volume, entitled 'Œuvres Choisies de Marot, Malherbe, Voiture, et Segrais,' Paris, 1810. See also the 'Liste Alphabétique des Auteurs,' prefixed to Richelet's Dictionnaire; and Baillet, 'Jugemens des Savans,' iv. 248-250.

VOLA'NUS, A'NDREAS, a Polish Protestant author, who acquired great celebrity by his controversy with the Jesuits, and by whom he was attacked with the most bitter violence. He was born in 1530, in the province of Posen, but lived chiefly at Vilna, where he was pastor of the Reformed church, and where he died in 1610, at the age of eighty. Besides his controversy with the Jesuits, he wrote against the Socinians, and had theological disputations with the Lutherans, in which he displayed great talent and learning, but failed in his object, which was to bring about a union between the Augustan and the Helvetian confessions in Poland. Besides a great number of controversial works which he published, and which had in their time a great run in the country, as well as abroad, Volanus is advantageously known as a political writer by his work 'De Libertate Politica seu Civili,' Cracow, 1582.

VOLKOV, FYEDOR GRIGORIEVICH, the founder of the Russian theatre, and son of a merchant of Kostroma, was born February 2nd 1729. His lost his father while young, and his mother married again, but her second husband, Polushkin, a merchant at Yaroslav, proved a kind stepfather to her children. He was more particularly attached to Fhedor, her eldest son, and sent him to the Zalkonaspassky Academy at Moscow to learn mathematics and German, and prepare himself for theological studies: but there Volkov was thrown in the way of pursuits very different and far more congenial with his disposition. It was the practice at that seminary for the scholars to get up dramatic recitations and performances, acting sometimes religious pieces or mysteries, and sometimes comedies taken from Molière. Except that he displayed general cleverness, we are not told what progress he made in his other learning, but in the dramatic art he was no sooner a scholar than he showed himself to be a master, and also made rapid proficiency in painting, music, singing, and other accomplishments of that kind. The idea of his studying theology was now given up, while that of his taking to the stage as a profession did not suggest itself either to him or his friends, because there was then no such profession—no public stage in Russia. He was therefore placed by his stepfather, in 1746, in the countinghouse of a merchant at St. Petersburg, with whom he soon became a favourite, and who took him to see the Italian operas at the court theatre. To say that Volkov was delighted would but coldly express the rapturous enthusiasm with which he was seized; nor was it at all abated when he afterwards saw some of Sumarokov's pieces performed or recited by the pupils of the 'Cadet Corps.' One of his first objects was to become acquainted with the scenes of the stage of the Court Theatre, to make himself master of Italian, and to obtain a thorough insight into all the business of the stage, with its machinery and various appurtenances. Not least of all it is to his credit, that though he was thus engrossed by his theatrical passion, he did not, distasteful as they were to him, neglect his counting-house duties, or the affairs which his stepfather had entrusted to his management.

Whatever it might have cost him at the time, for this he was amply rewarded by the affectionate reception with which he was greeted by his worthy stepfather Polushkin and his whole family on his return to Yaroslav. Instead of being lectured for his theatrical passion, he was permitted to get up a theatrical performance, after he had sufficiently trained his brothers and some of their acquaintance, and a barn had been converted into a stage, with a curtain, &c. All Yaroslav was invited, and all Yaroslav went away in raptures—which were more than mere compliments, for some of the principal inhabitants immediately set on foot a subscription to erect a permanent theatre, of which Volkov was appointed architect, decorator, scene-painter, machinist, manager, director of the orchestra, purveyor of novelties, and dramatic writer. This was the first Russian theatre, the progenitor of those magnificent and colossal edifices of which that country can now boast.

It was not long before the fame of the Yaroslav theatre reached St. Petersburg, and the Empress Elizabeth wished to witness a performance by the Yaroslav actors on her own private stage. They accordingly repaired to Petersburg, and played before the empress Sumarokov's drama of 'Sinav and Truvor.' Their success was complete, and the whole company, nearly of youthful actors as they were, and most of them were placed in the 'Cadet Corps,' in order to perfect their education, and some were sent abroad to study the dramatic art and improve their talents.

In 1757 Volkov was ordered to proceed to Moscow, and establish a theatre in that capital; which commission he executed with so much zeal and ability, that within the course of two years the stage was there put upon a very respectable footing, both in point of talent and of scenic representation. Standing high in the favour of the empress, he enjoyed that of the court, and afterwards of her successor Catherine II., who would have conferred on him the rank of nobility, had he not declined that distinction for himself, begging that it might be transferred to his married brother Gabriel. But he did not enjoy Catherine's favour very long, for at the time of her coronation at Moscow, on which occasion he was charged with the superintending the arrangements of some part of the public festivities, he caught a cold that was succeeded by inflammatory fever, which carried him off, April 4th 1763.

Volkov had to have translated several pieces for the stage, and also to have written some original ones; but as none of them have been preserved, or if in existence have not yet been brought to light, his fame as a dramatist is only traditional. He also made a collection of the biblical dramas of St. Demetrius, metropolitan of Rostov (1651-1709), which he presented to Catherine, who bestowed them on Prince Orlov, who was a great admirer of literary relics and antiquities; but what afterwards became of the manuscripts is not known. (*Entsiklopedicheskoi Lexikon.*)

VOLNEY, CONSTANTIN-FRANÇOIS, CHASSE-BŒUF, COMTE DE, was born February 3rd, 1757, at Craon in Anjou, where his father

Digitized by Google

was a distinguished advocate. He was educated at the colleges of Ancenis and Angers. At this time, and till he reached his twenty-fourth year, he bore the name of Boisgirais, invented by his father, to whom the ancestral Chasseboeuf had always been matter of annoyance. His father's wish was that he should study the law; and with this view he came up to Paris in his seventeenth year, having already a small income of 1100 livres (about 46l.) of his own, left him by his mother; but he soon exchanged the study of the law for that of medicine; and eventually, on succeeding to a further independent revenue of 6000 livres (240l.), he gave up the thought of following any profession. He now, in 1783, set out for the East. After shutting himself up for eight months in an Egyptian convent to study the Arabic language, he spent above two years more in traversing Lower Egypt and Syria; and on his return to France in 1787 he published, in 2 vols. 8vo, his account of the physical and political condition of these countries, and of their geography and antiquities, under the title of 'Voyage en Syrie et en Egypte pendant les années 1783, 84, et 85.' The first edition of Larcher's translation of and commentary on Herodotus had been published at Paris the year before, and had probably done something to awaken a general interest about the subject of Volney's book. Volney also, with the advantages of personal observation, with very considerable learning, and with more acuteness than Larcher, came to support the same view of the trustworthiness of Herodotus which that writer had enforced. On the whole, Volney's was universally received as at once by far the most graphic and spirited, and the most exact and complete description of Egypt and Syria which had yet appeared. A third edition of the work, with considerable additions, appeared in 1800; and there is an English translation of it in 2 vols. 8vo. It was followed the next year by a short tract on the war then carrying on between Turkey and Russia ('Considérations sur la Guerre des Russes et des Turcs'), remarkable for its anticipation of the seizure of Egypt by the latter attempted ten years later; and also for a prescient indifference or unusual frankness with which certain facts and questions of the diplomacy of the day were discussed in it; so that it was christened by the wits 'Inconsidérations sur la Guerre,' &c. This tract was reprinted in the 1800 edition of the 'Voyage,' and again by itself in 1803.

Volney, who had some sanguine notions upon new modes of farming, which he wished to have an opportunity of trying on a property he proposed purchasing in Corsica, now got himself appointed by the French government director of the agriculture and commerce of that recently acquired island; but being elected deputy of the 'tiers état' to the National Assembly for the sénéchaussée of Anjou, he remained for the present in France to take part in the great events about to be transacted there; and he soon after resigned his government office. In the Constituent Assembly, and in the Convention, in both of which he was also a member, Volney acted generally with the party of the Girondists, assisting the onward movement till the establishment of the reign of terror in 1793; when, like many of his associates, he began to think that matters had been carried too far; but having a weak voice, he was no orator, and his influence in the debates was inconsiderable. His history accordingly still continues to be principally that of his literary career. It appears that in 1788 he had commenced at Rennes a paper called 'La Sentinelle.' In 1790 he gave in to the Académie des Inscriptions an essay for a proposed prize on the subject of the Chronology of the Twelve Centuries preceding the Invasion of Greece by Xerxes. Although he had no competitor, the prize was not awarded to him; but the essay was afterwards published by Naigeon in the 'Encyclopédie Méthodique.' In September 1791 he presented to the National Assembly his famous 'Ruines, ou Méditations sur les Révolutions des Empires;' the work in which he first announced those peculiar views as to the symbolical character of the Christian and other religions (similar, as has been observed, to those developed by Dupuis in his 'Origine des Cultes,' probably known to Volney, though not yet published), to which his name principally owes its popular notoriety. There are numerous French editions of the 'Ruines,' and there is also a wretched English translation of the work, which has been often printed. It contains many striking and ingenious views and some eloquent writing, though extravagant and absurd in its leading principles. Soon after it appeared, Volney retired to Corsica to cultivate a property which he had purchased there; but the insurrection headed by Paoli compelled him to leave the island in the spring of 1793. It was during this visit to Corsica that he first became acquainted with Napoleon Bonaparte, then an officer of artillery.

On his return to Paris, Volney published in the 'Moniteur' of the 20th and 31st of March a 'Précis de l'Etat de la Corse.' In 1793 he published his well-known brochure (generally printed with his 'Ruines'), entitled 'La Loi Naturelle, ou Catéchisme du Citoyen Français,' or otherwise 'Principes Physiques de la Morale,' a title which sufficiently explains its spirit and object. It is a clear and comprehensive exposition of such a system of ethics as can be reared on the theory of materialism. Volney was now sent to prison by Robespierre as a royalist, and remained in confinement for about ten months; he regained his liberty on the overthrow of Robespierre by what is called the revolution of the 9th Thermidor (27th July 1794). Soon after he was appointed professor of history in the newly-established École Normale; and here for about a year he delighted crowded audiences by his brilliant lectures, which were taken down as they were delivered, and have been several times printed. In 1795 he drew up, at the request of the government, a series of 'Questions de Statistique à l'Usage des Voyageurs,' which were published in 1813. This year also he published the first of his works on a subject which for the rest of his life engaged much of his attention—a tract entitled 'Simplification des Langues Orientales, ou Méthode nouvelle et facile d'apprendre les Langues Arabe, Persane, et Turke, avec des Caractères Européens.' His notions upon this subject were opposed by Langlès, Silvestre de Sacy, and other orientalists, but he never himself relinquished them; and he had the satisfaction, a few years after this, of having an important testimony borne at least to the learning and ingenuity he had shown in explaining and applying them, by the Asiatic Society at Calcutta, which in 1798 elected him one of its honorary members.

The École Normale was suppressed in 1795; upon which Volney proceeded to the United States of America. He was well received by Washington, then president; but his residence became less comfortable after the commencement, in 1797, of the presidency of John Adams, whom he is said to have offended by some severe things he had said of his work on the 'Constitution of the United States;' and in the spring of 1798 he quitted America and returned to France. While residing in New England he had been attacked by Priestley in his 'Observations on the Progress of Infidelity;' and he replied in a pungent letter, which he caused to be translated into English and sent to the press. During his absence he had been elected a member of the Institute. Ever since they became acquainted in Corsica, Volney and Bonaparte had been good friends; it is said that it was by Volney's advice that Bonaparte was dissuaded from going, in the beginning of 1794, to offer his services as a military man to Turkey or Russia; and Volney is supposed to have had, soon after his return from America, a share in the contrivance and preparation of the revolution of the 18th Brumaire (9th of November 1799), which placed Bonaparte at the head of affairs. Bonaparte wished him to be one of his colleagues in the consulate; but he refused both that and the ministry of the interior, and would only consent to be nominated to a seat in the senate. From this date an alienation began to take place between the two; their first open difference was on the subject of the church, the restoration of which as one of the establishments of the state Volney conceived to be a very foolish proceeding; but their notions upon all other matters also ran in opposite directions. When Bonaparte assumed the imperial title, Volney offered the resignation of his senatorial dignity; he was prevailed upon to retain his seat, but he seldom attended after this, and when he did he joined the small minority of the body which Napoleon contemptuously called the 'Idéologues.' He nevertheless received under such names as he subsequently however accepted the titles of comte and commandant of the Legion of Honour. In 1803 he published, in 2 vols. 8vo, his 'Tableau du Climat et du Sol des États-Unis d'Amérique,' a work which sustained the reputation he had acquired by his 'Travels in Egypt and Syria,' though it is now of no value. His last work was 'Appendice fait à l'Académie Celtique sur l'Ouvrage Russe de M. le Professeur Pallas, Vocabulaires comparés des Langues de toute la Terre,' which appeared in 1805. In 1808 he recast his 'Essay on the Chronology of the Early Ages,' and republished it under the title of 'Supplément à l'Hérodote de Larcher.' This is a tract of only eighty pages, in which he fixes the date (B.C. 625) of the great solar eclipse stated to have been foretold by Thales [ALYATTES; THALES]; and also that of the capture of Sardis and fall of the Lydian kingdom (B.C. 557). That and another work, entitled 'Chronologie d'Hérodote,' which he published the following year, involved Volney in a controversy with Larcher, whom he had attacked with much asperity, provoked perhaps in part by the complete change of opinion as to religion which Larcher, though he had decided as infidel as himself, had avowed in the second edition of his 'Herodotus,' published a few years before. Volney however suppressed most of the personalities originally contained in these two works when he reprinted them in 2 vols. 8vo, in 1814, along with an examination of the antiquities of Persia, India, and Babylon, under the title of 'Recherches Nouvelles sur l'Histoire Ancienne.'

In 1810 Volney married his cousin, formerly Mademoiselle de Chasseboeuf, between whom and himself there had existed an early attachment, but who had married while her lover was abroad, and was now a widow. Upon this occasion he removed from the small house in the Rue de la Rochefoucauld, in which he had resided since his return from America, to a fashionable mansion, with a large garden, which he bought in the Rue de Vaugirard. Volney was one of the senators who voted in favour of the decree passed the 2nd of April 1814, for the deposition of Bonaparte; and on the 4th of June following he was elevated to the peerage by Louis XVIII. It may be conceived from all this, that his early political ardour had now considerably abated. But he showed that some of his old opinions were still the same as ever by a pamphlet entitled 'Histoire de Samuel, Inventeur du Sacre des Rois,' which he published in 1818, when preparations were making for the coronation of Louis at Rheims, and in which he treated the character of Samuel and of the Hebrew Scriptures in general with equal freedom. It is said that Louis himself, who in private used to profess a very easy liberalism, both in religion and in politics, read this inquiry with not a little relish. Volney's

Digitized by Google

last publication appeared the same year, a tract which he dedicated to the Asiatic Society, entitled 'L'Alphabet Européen appliqué aux Langues Asiatiques.' He also read to the Academy, in 1819, a 'Discours sur l'Etude Philosophique des Langues,' and the collection of 'Œuvres Complètes,' published in 8 vols. 1820-1826, contains two letters to M. le Comte Lanjuinais, 'Sur l'Antiquité de l'Alphabet Phénicien,' dated also in that year. The last work he prepared for the press was an octavo volume, entitled, 'L'Hébreu simplifié,' which appear d immediately after his death. All his acknowledged writings have now been mentioned except a paper entitled 'Vues Nouvelles sur l'Enseignement des Langues Orientales,' and another entitled 'Etat Physique de la Corse,' both printed in the eighth volume of his collected works. He also was a considerable contributor anonymously to the 'Moniteur' and the 'Revue Encyclopédique.'

Volpcy died on the 25th of April 1820. The above facts are chiefly abstracted from an excellent though somewhat partial memoir of him, in the 'Biographie Universelle,' by M. Durozoir.

VOLPATO GIOVA'NNI, a distinguished Italian engraver, was born at Bassano in 1733. He was first employed in tapestry embroidery, an art which he learnt from his mother; but he at the same time occasionally occupied himself with engraving, which he acquired without instruction, and he published some prints under the assumed name of Renard. The success of these prints was sufficient to induce him to adopt engraving as a profession, and he accordingly fixed himself in Venice, where he became the pupil of the celebrated Bartolozzi. Volpato engraved many good prints after several Venetian masters, but his best works were engraved after Raffaelle and other masters at Rome, where he finally settled. He was employed by the pope as engraver by a society of dilettanti which undertook to re-engrave all the works of Raffaelle in the Vatican. Volpato engraved on a large scale seven of the great works of Raffaelle in the so-called stanze; an eighth, 'The Mass of Bolsena,' was engraved by his pupil and son-in-law Raphael Morghen. The prints are published coloured as well as plain, and are a very valuable set of engravings. He published in the same style the Farnese Gallery of Annibal Carracci; and many other celebrated works of the great Italian masters. He published also many coloured landscapes in imitation of Roman views, &c., in partnership with P. du Cros. Another of his great works is a set of fourteen views of the galleries of the Museo Clemeotino, with all its works of art. He engraved also two prophets and two sibyls from those of Michel Angelo in the Sistine Chapel. His prints are remarkably numerous considering their scale and the style in which they are executed. Huber, who wrote before the death of Volpato, enumerates, as his principal works, 166 engravings. He and his son-in-law Morghen were the best engravers in Italy at the end of the 18th century. Volpato died at Rome August 21, 1803.

VOLPI, GIAN ANTONIO, born at Padua in 1686, studied in his native town, and became a good Latin and Greek scholar. In 1717 he and his brother Gaetano Volpi established a printing-press in their house for the purpose of bringing out correct editions of classic authors, and they engaged for that assistant the printer Giuseppe Comino. This press—known by the name of Volpi-Cominiana, produced among others a valuable edition of Catullus with copious notes. The edition was much commended by scholars, and the city of Verona struck a gold medal, which was presented to Volpi: the title is, 'Caius Catulus Veronensis et in eum Jo. Antonii Volpii novus Commentarius,' 4to, Padua, 1737. Volpi afterwards edited Tibullus and Propertius. He translated from the Greek into Italian the dialogue of Zacharias Scholasticus; he wrote a disquisition on the satire of the Romans: 'Liber de satyræ Latinæ ortura et ruinâ, item paraphrasis perpetua et commentarius uberrimus in X satyram Juvenalis,' Padua, 1744; he edited the poems of Saonazaro, with a biography of the author; he published a new editioo of Dante; and he wrote three books of Latin poems, to which he added those of his ancestor and namesake Gian Antonio Volpi, the elder, who was bishop of Como and one of the Fathers of the Council of Trent. Volpi was for many years professor of philosophy and of rhetoric in the University of Padua. In his old age he became blind, and he died in 1766. His brother Gaetano Volpi edited Sallust in 1722, and he was an active assistant to his brother at the press. He wrote an account of their joint labours: 'La Libreria dei Volpi e la Stamperia Cominiana.' Giuseppe Comino having died in 1752, his son Angelo Comino continued to carry on the business. Another brother of Volpi, named Giuseppe, undertook the continuation of Cardinal Corradini's great work, 'Vetus Latium profanum,' which he completed.

VOLTA, ALESSANDRO, was born at Como in 1745, of a noble family, and was educated in that city. In 1774 he was appointed professor of natural philosophy in the University of Pavia, and while he held that chair he made the discoveries which have immortalised his name.

It appears that in his youth he had a taste for letters, and among his effusions is a poem, in Italian, on Saussure's journey to Mont Blanc: he also composed one in Latin, which treats of the principal phenomena of chemistry. This taste did not however continue, and the bent of his mind was afterwards decidedly in favour of the sciences connected with electricity.

In 1777 Volta made an excursion into Switzerland, and three years afterwards he travelled through Tuscany. During the latter journey he observed and drew up a description of the flame which appears to issue from the ground about 40 miles from Florence, on the road to Bologna. In 1782 he travelled through Germany and Holland, and made a visit to England, where he became known to Sir Joseph Banks and the most distinguished philosophers of the country. He returned through France, and he is said to have then introduced into Lombardy the culture of the potato, which he had observed in Savoy.

When Bonaparte first entered Italy, in 1796, Volta was one of the persons appointed by his fellow-citizens to solicit the protection of that general, who afterwards took every opportunity of conferring honours upon him. He caused him to be named a deputy from the University of Pavia to a congress which was held at Lyon for the purpose of electing a president of the Italian republic; and in 1801 he invited him to Pavia, in order that he might repeat before the members of the Institute his experiments with the *pile* which he had invented. On this occasion that learned body presented Volta with a gold medal, and elected him one of its foreign associates. Bonaparte also make him a member of the Legion of Honour, and conferred on him the order of the Iron Crown, with the titles of count and senator of the kingdom of Italy. He had been elected a Fellow of the Royal Society of London in 1791.

In 1804 Volta was allowed to resign his professorship; and, giving up his studies, he spent the rest of his life at his native town, Como. Here he was seized with a fever, which, after an illness of only two days, terminated fatally on the 5th of March 1827. He married in 1794, and by his wife he had three children, whose education he himself superintended. His life was one of uniform piety, and he died sincerely lamented by every friend of science, particularly by his fellow-citizens, who struck a medal and erected a monument to his memory.

In proof of the inclination of Volta in favour of the physical sciences, it may be observed, that when he was only eighteen years of age he corresponded with the abbé Nollet on the subject of electrical phenomena, and that six years afterwards (1769) he addressed to Beccaria a dissertation in Latin, entitled 'De Vi Attractivâ ignis Electrici.' In 1775, while pursuing some experiments on the non-conducting property of wood when impregnated with oil, he was led to the construction of his 'electrophorus,' so instrument consistiog of two circular plates of metal haviog between them one of resin: the upper plate was furnished with an isolating handle of glass, by which it was to be raised from the plate of resin; and the latter being excited by friction, the whole was found to exhibit a kind of electrical machine. An account of it was given in Kosier's 'Journal de Physique' for 1776, and Dr. Ingenhouz afterwards explained its principles on the Franklin theory of positive and negative electricity. ('Phil. Trans.,' 1778.)

The efforts of Volta to improve the electrophorus led him in 1782 to the discovery of the instrument which he designated an electrical condenser. This is rather a variation of the former instrument, a plate of marble or varnished wood being substituted for the resin between the conductors. A wire being brought to the upper conductor from the object in which a faint degree of electricity exists, after a time the conductor, on being lifted up by the glass handle, is found to have received from the object a considerable quantity of electricity. An account of this instrument was given by Volta himself, in the 'Philosophical Transactions' for the same year (vol. lxxii.); and it is there stated that he had succeeded in ascertaining by it the existence of negative electricity in the vapour of water, in the smoke of burning coals, and in the gas produced by a solution of iron in weak sulphuric acid. With this instrument Volta employed an electrometer consisting of two pieces of straw suspended in a glass jar, from the stopper; these diverged from each other on bringing an electrified body in contact with a ball of metal connected with the stopper; and by means of a graduated scale, the intensity of the electricity was measured.

In 1777 Volta invented the elegant apparatus which is called the hydrogen lamp; it is constituted by a stream of hydrogen gas, which is made to issue through a small aperture by means of the pressure of a column of water, and the gas is fired by the spark from an electrophorus placed below it. About the same time he discovered a process for determining the proportions between the two gases, oxygen and azote, which constitute common atmospherical air; this is accomplished by introduoing a given quantity of hydrogeo gas into a glass tube with a certain quantity of atmospherical air, and firing it by the electrical spark: the quantity of oxygen was indicated by the diminution of the volume. He also invented the instrument which has been called the electrical pistol.

But the discovery by which the name of Volta is chiefly distinguished is that of the development of electricity in metallic bodies. A series of experiments judiciously devised and skilfully conducted led him to the knowledge of this principle, the applications of which have since produced such important consequences.

Galvani had given the name of animal electricity to the power which caused spontaneous convulsions in the limbs of frogs when the divided nerves were connected by a metallic wire [GALVANI]; but Volta observing that the effects were far greater when the connecting medium consisted of two different kinds of metal, inferred from thence that the principle of excitation existed in the metals, and not in the nerves of the animal; and he assumed that by their contact there was

Digitized by Google

developed a small quantity of the electrical fluid, which, being transmitted through the organs of the frog, produced the convulsive movements. These discoveries Volta communicated to the Royal Society of London in two letters addressed to Mr. Cavallo, which were published in the 'Philosophical Transactions' for 1793; and in the following year he had the honour of receiving the Copley medal, in gold, which was awarded to him by the society. In the first letter it is stated that when different metals are placed near each other, with a saline liquid between them, there is produced a disturbance of electrical equilibrium, one metal giving a portion of its natural electricity to the other, so that the latter becomes positively and the former negatively electrical; the use of the liquid being to transfer the electricity from one metal to the other. But in the second letter Volta states that he considers all conductors of electricity to be divided into two classes, one dry and the other moist; and he assumes that electricity is excited when two conductors of either of these classes are in contact with one of the other class: an idea apparently at variance with that of the supposed actions of unlike metals on one another.

Repeated experiments, followed up during seven years, led Volta at length to the invention of what is designated an electrical battery: it consisted of a series of cups disposed in the circumference of a circle; each cup contained a saline liquid, in which were placed, on their edges, a plate of zinc and one of silver; and the upper edge of the silver plate in each cup was connected by a wire with that of the zinc plate in the next. This apparatus, which was called a 'corona,' was superseded by one formed on the same principle with respect to the alternations of metal plates, but in which the Galvanic or Voltaic pile. Volta's account of his researches concerning the development of electricity by the pile was sent to the Royal Society in the year 1800; but, in consequence of the war between Great Britain and France, one portion of the account could not be sent till some months after the first had been received; and in the interval the pile was reconstructed, and many experiments were made with it in this country. The paper appeared however in the 'Philosophical Transactions' for that year (vol. xc.), in the form of two letters addressed to Sir Joseph Banks.

It is remarkable that Volta, during the remainder of his life, confined his experiments with the pile to such as concern its action on the animal body, and he does not appear to have made any use of it as an instrument of chemical analysis; even the decomposition of water by it was first effected by Messrs. Nicholson and Carlisle. He always maintained the opinion that an electrical process took place in the pile, and that a chemical action was merely incidental; while the English experimentalists in general considered the latter as essential to the production of the effects, and to arise from the oxidation of the metals by the saline liquid: they found that the pile did not act when pure water is interposed between the plates, and that its action ceases when the apparatus does not continue to receive a supply of oxygen. The latest researches have shown that the effects of the pile are partly electrical and electro-magnetical, and partly chemical: to the former class are referred muscular contractions and the deviations of magnetised needles; and to the latter the decompositions of material substances. It may be observed here, that Volta supposed the heart and the other involuntary muscles to be incapable of being excited by galvanic action—an opinion which has been found to be erroneous.

By the faculty of skilfully combining experiments, and a profound sagacity in perceiving the consequences which might be deduced from them, Volta was enabled to make many important discoveries; but it is remarkable that he often held unfounded opinions of the causes of the phenomena, and he does not appear to have pursued any of his researches so far as to arrive at mathematical precision in his results. Thus he erroneously ascribed the properties of his electrophorus and condenser to the effects of an electrical atmosphere which he supposed to exist about the surface of bodies. He observed Lesslie's mode of considering his electrometer to be capable of measuring with accuracy the intensity of electricity in bodies; when, for this purpose, it was in reality far inferior to the torsion balance of Coulomb. By a series of experiments he succeeded in discovering the influence of conductors on the preservation and transmission of electricity; but it was reserved for the last-mentioned philosopher to determine by experiment and by mathematical analysis the exact laws of the dissipation of electricity from bodies in contact with air, its density in spheres of different magnitudes, and also of different parts of an imperfectly insulating body, and the influence of points in facilitating its transmission. An inattention to accuracy of investigation is considered as the cause that Volta lost the opportunity of discovering the true cause of the development of electricity in the evaporation of water, which is the most important circumstance in the electrical phenomena of the atmosphere.

A collection of the works of Volta, dedicated to Ferdinand III., grand-duke of Tuscany, was published, in 1816, at Florence, under the title, 'Collezione delle Opere,' &c., in 5 vols. 8vo.

VOLTAIRE, FRANÇOIS-MARIE AROUET DE, was born at Châtenay, near Sceaux, on the 20th of February 1694. His baptism was deferred to the 22nd of November in the same year, on account of his feeble health. His father François Arouet was Trésorier de la Chambre des Comptes, and his mother Marguerite Daumart belonged to a noble family of Poitou. Voltaire was the younger of two sons. He was educated at the college of Louis le Grand, then under the direction of the Jesuits. His character must have already developed itself, if the story is true that Father Lejay, one of his instructors, predicted that he would be the Corypheus of deists in France. On leaving college he was introduced by his godfather, the Abbé Châteauneuf, to Ninon de l'Enclos, who was much pleased with his lively manners, and bequeathed him a legacy of two thousand francs for the purchase of books. The abbé also introduced him to that brilliant society in Paris, consisting of the Duc de Sully, the prince of Conti, the grand-prior of Vendôme, the abbé de Chaulieu and others, whose conversation confirmed the youth in those loose principles which he had already imbibed. But he was not entirely engrossed by the pleasures of Paris; he had already sketched his tragedy of 'Œdipe,' and in 1712 he was an unsuccessful candidate for a poetical prize which was awarded by the French Academy. In order to detach him from the society of Paris, his father sent Voltaire, in 1713, with the marquis de Châteauneuf, who was ambassador in Holland. Here he fell in love with a daughter of Madame Dunoyer, an intriguing woman, who had left France for Holland to escape from her husband, and had embraced the Protestant religion. It is not clearly stated why the mother disapproved of the mutual affection of her daughter and Voltaire, but she complained to the ambassador, and printed the correspondence of the two lovers. Voltaire was sent back to France, and with difficulty reconciled to his father, who complained of the libertinism of his younger son as much as of the Jansenist opinions of the elder.

Voltaire was now placed with a procureur, but the practice of the law was intolerable to a man of his tastes and temperament, and he soon left it. A friend of the family, M. de Caumartin, obtained his father's consent to take Voltaire with him to Saint-Ange. Here he met with the father of M. de Caumartin, who had been familiar with the court of Henri IV. and the distinguished persons of that king's reign. Voltaire was delighted with the anecdotes and conversation, out of which grew the idea of the 'Henriade.' He returned to Paris with his project of an epic poem, and his next step was into the Bastille. Louis XIV. had just died, and his memory was attacked by numerous satirical verses. Voltaire, who was then twenty-two years of age, was well enough known to be suspected as the author of some of these verses, and without further evidence he was imprisoned. In his confinement he sketched his poem of the 'Henriade,' under the title of 'La Ligue,' and completed his tragedy of 'Œdipe.' He was soon released by the Regent Duke of Orleans, who left him ignorant of his innocence. It is said that about this time he took the name of Voltaire. The tragedy of 'Œdipe' was played in 1718, and was successful, but the author was first compelled by the judgment of the actors to insert a frigid love episode in the 'Œdipe,' in compliance with the taste of the times. In this, his earliest work for the stage worthy of his reputation, Voltaire commenced that war against the priesthood which he maintained with unabating perseverance to his dying day. The two following verses have been quoted as the manifestation of that hostility to the ministers of religion which became his ruling passion:—

"Nos prêtres ne sont pas ce qu'un vain peuple pense,
Notre crédulité fait tout leur science."

In 1721 Voltaire accompanied Madame de Rupelmonde to Holland, and on the way visited Jean Baptiste Rousseau, who was then at Brussels. Voltaire took the opinion of Rousseau on his poem of the 'Ligue,' and read to him the 'Epître à Uranie.' Rousseau re-paid the compliment by reciting his 'Ode to Posterity,' which Voltaire told him would never reach its address. The story may not be true, but it is at least characteristic of Voltaire. They parted bitter enemies; and from that time Voltaire was the object of Rousseau's implacable hatred.

In 1724 the play of 'Mariamne' appeared, and shortly after the 'Henriade,' under the title of 'La Ligue,' but without the author's consent. The poem had been read by Voltaire to his friends, in order to have the benefit of their criticism, and an imperfect copy of it had been surreptitiously obtained by the Abbé Desfontaines, and printed with some additional verses. The author however could not obtain permission to print it himself, for there were various passages which gave offence to the priesthood. This is the statement in the 'Biographie Universelle,' but it is said in Marmontel's preface to the 'Henriade,' that the first edition of it was printed at London in 1723, and that as Voltaire could not see it through the press, it is full of blunders and transpositions, and also contains considerable blanks (lacunes). It is not suggested that this edition was surreptitious, though it may have been.

A personal adventure, the particulars of which are unimportant in a general sketch like this, led to a quarrel with his friend the Duc de Sully, and shortly after to a second visit to the Bastille, where Voltaire was confined some months. On being released, he was ordered to leave the country, and he came to England, where he found a state of opinion more congenial to his own than in France. The writings of Woolston, Tindal, Collins, and others of the same class, were then in vogue; freethinking opinions were generally diffused; and besides this, the discoveries of Newton and the philosophy of Locke had given an impulse to men's minds in England,

Digitized by Google

which placed this country at that time in a higher position with respect to the rest of Europe than she had previously occupied. Voltaire had suffered injustice in France from the arbitrary exercise of power; and he had a foretaste of what he might expect from the intolerance of the church. In England he saw a country in which personal liberty was secure, and in which the priesthood had lost the power of persecution. His residence in England, and the society which he saw, exercised a strong influence on him, but it was the religious rather than the political freedom of England which he admired. His notion of liberty was the liberty of writing against priests and religion. In England he wrote his tragedy of 'Brutus,' and in 1726, according to Marmontel's preface, appeared the first edition of the 'Henriade' which the author himself superintended, it was printed at London, with a dedication in English, by the author, to Queen Caroline, the wife of George II. The edition bears the date 1728, and not 1726, which is a manifest mistake of Marmontel. The work was published by subscription, and produced the author a considerable sum of money. In England also he sketched the 'Lettres Philosophiques,' called also the 'Lettres sur les Anglais,' which appeared some time after. His residence in England was about three years.

Voltaire returned to Paris, and for some time lived a quiet life, dividing his time between literary labour and commercial speculations, which turned out profitable. He also gained some money in a lottery. In 1730 the celebrated actress Adrienne Lecouvreur died, and the usual rites of sepulture were refused to her because she was an actress. Voltaire wrote some verses on the mode in which she was buried, full of indignant invective, and immediately withdrew to Rouen, pretending that he was going to England in order to avoid a third visit to the Bastille, which he apprehended. At Rouen he printed his 'History of Charles XII. of Sweden,' for which he had collected materials during his residence in England; and also his 'Lettres Philosophiques. The publication of the Lettres raised a fresh storm, the violence of which seems to have been quite disproportionate to the occasion: they are not the works of Voltaire which even his enemies could most complain of. Voltaire got out of the way in order to avoid a fresh exile, which was denounced against him. His friends however convinced those in authority that the publication of the Lettres was owing to the treachery of a binder, and Voltaire obtained permission to return to Paris. But the 'Epître à Uranie, which had been long in manuscript, was now printed, and the author was threatened with a fresh prosecution, which he avoided by disingenuously disavowing it, and attributing the work to the Abbé de Chaulieu, who had been dead for some time. To escape all further trouble, Voltaire determined to retire for a time from Paris. His own successful speculations, and what he had inherited from his father and his brother, had given him a handsome fortune. He had also formed a connection with Madame du Chastellet, the wife of the Marquis du Chastellet, a woman, though fond of pleasure, possessing acquirements which are very unusual in her own sex, and not common in the other. [CHASTELLET, MARQUISE DU.] Her studies were geometry and metaphysics, but she could relish poetry and polite literature. She retired with Voltaire to Cirey, on the borders of Champagne and Lorraine, where they led a life of study and retirement, interrupted and varied by an occasional quarrel. At Cirey Voltaire wrote several of his plays, 'Alzire,' 'Mahomet,' 'Mérope,' and others; and he collected materials for the 'Essai sur les Mœurs et l'Esprit des Nations,' which, with all its defects, is one of his best works. Here also he finished his 'Pucelle,' which he had commenced some time before. Several fragments of it had been circulated before he left Paris.

It was in the year 1736, during his residence at Cirey, that a correspondence commenced between Prince Frederick, the son of Frederick William, king of Prussia, and Voltaire; it began by Frederick writing to him to express his admiration, and to solicit the favour of Voltaire's literary counsel. Voltaire's residence at Cirey was not uninterrupted. He visited Paris, and also on several occasions left France, but his movements are not easily traced. Voltaire was at Brussels with Madame du Chastellet, in 1740, when Frederick William died, and he soon received an invitation from his successor Frederick to visit him. The first meeting of the new King of Prussia and Voltaire took place at a small château near Cleves, and is described by Voltaire in his amusing Mémoires. When Frederick was prince-royal, he had written a treatise entitled 'Anti-Machiavel,' which he sent to Voltaire, who was then at Brussels, to correct and get it printed. Voltaire had given it to a Dutch bookseller, but on the accession of Frederick, seeing what his political schemes were, and anticipating, as he says, the invasion of Silesia, he suggested to his majesty that this was not precisely the time for the 'Anti-Machiavel' to appear, and he obtained the king's permission to stop the publication, for which purpose he visited Holland. But the bookseller's demands were high; and the king, who did not like parting with his money, and was at least not sorry to see his work printed, preferred having it published for nothing to paying anything in order to stop the publication. This is Voltaire's account of the transaction. While Voltaire was in Holland the Emperor Charles VI. died, and Frederick began to make preparations for his campaigns. Voltaire visited him at Berlin, but on Frederick's setting out for Silesia, he returned to Brussels. From Brussels he went to Lille, where his tragedy of 'Mahomet' was acted (1741), but though he had at first obtained the permission of the Cardinal de Fleury to have it acted at Paris, the representation was prevented by the intrigues of some zealots, who saw or affected to see in it an irreligious tendency. 'Mahomet' was not acted at Paris till 1751.

On the death of Cardinal de Fleury, in 1743, Voltaire sayired to fill his place in the Académie Française. The King Louis XV., his mistress the Duchess of Châteauroux, and the public were in his favour; but Maurepas, the secretary of state, was opposed to him, and successfully intrigued with Boyer, afterwards bishop of Mirepoix, to exclude Voltaire from the Académie. Boyer represented to the king that it would be a scandal for such a profane man as Voltaire to succeed a cardinal; and the king yielded to his representations.

At this crisis France was threatened both by Austria and England, and it was thought prudent to cultivate the alliance of the king of Prussia. The Duc de Richelieu and the favourite mistress conceived the design of sending Voltaire to him, and, the better to conceal the object of the mission, Voltaire made his quarrel with Boyer a pretext for leaving France. The king approved of the scheme, and Voltaire, who was well furnished with money for his journey, set out for Berlin by way of Holland. He was well received by Frederick, who was then living at Potsdam the kind of life which he continued ever after his accession to the throne, and which Voltaire has depicted so inimitably in his Mémoires. His mission was to sound Frederick as to his views, and he succeeded in drawing from him a favourable declaration. Voltaire returned to Paris, having executed his commission better than most diplomatists, as the event showed: in the following spring Frederick made a new treaty with Louis, and advanced into Bohemia with one hundred thousand men, while the Austrians were engaged in Alsace. But Voltaire was left without his reward. The mistress was vexed that all Voltaire's letters from Berlin had passed through the hands of Madame du Chastellet, instead of her own: she therefore contrived by causing the disgrace of M. Amelot, the minister for foreign affairs, from whom Voltaire had received his instructions, and Voltaire's hopes were thus disappointed.

The mistress herself was soon dismissed; and on her death, which followed shortly after, it was necessary for Louis to have a new favourite, and Mademoiselle Poisson, subsequently known as Madame de Pompadour, filled the vacant place. Voltaire was already acquainted with her, and, as he says, was in her confidence. Through her interest he was made one of the forty members of the Académie, in the place of Destouches (1746): and he was also appointed historiographer of France, and received the place of gentilhomme ordinaire de la chambre du roi. "I concluded," says Voltaire, "that to make the smallest fortune, it was better to say four words to the mistress of a king than to write a hundred volumes."

Voltaire spent their residence at Cirey, Voltaire and Madame du Chastellet occasionally visited King Stanislaus at his little court of Luneville, which Voltaire has sketched in his usual happy way. Madame du Chastellet died in the palace of Stanislaus (August, 1749), a few days after she had been brought to bed. Voltaire returned to Paris, and resumed his literary labours. King Frederick, who had not been able to induce him to visit Prussia during the lifetime of Madame du Chastellet, now renewed his invitation, and after some hesitation Voltaire went to him in 1750. He had apartments assigned to him at Potsdam, a pension of 20,000 francs, the chamberlain's key, and a cross of merit. His duties were to correct his majesty's writings, which was rather an irksome occupation; and Voltaire could not always prevent expressions escaping him which were reported to the king, and were far from complimentary. To censure Frederick's French verses without laughing at them was impossible. The history of his residence in Prussia is briefly sketched in Voltaire's 'Mémoires.' Voltaire at last got away, "with a promise," as he says, "to return, and the firm resolution never to see him again:" his residence in Prussia was three years. On his return, an old adventure befel him at Frankfort. He was arrested by a person named Freytag, the resident of the King of Prussia at Frankfort, who demanded of him, in his barbarous French, "l'oeuvre do poschie" of the king his master. A few copies of this precious volume of Frederick's poems had been printed privately and distributed by the king among his favourites: Voltaire had been honoured with one. The poetry had been left behind at Leipzig, and Voltaire was obliged to wait at Frankfort till it came, when it was delivered up to the resident. Frederick, well knowing Voltaire's character, probably feared that he would make some use of the book of poetry to his prejudice, as it contained many satirical reflections on crowned heads, and other persons. Even after the surrender of the book, Voltaire and his niece Madame Denis, who had joined him at Frankfort, were detained by Freytag on some miserable pretexts, and kept prisoner in an hotel for twelve days. He was robbed of part of his property, and compelled to pay the expenses of his detention. At last orders came from Berlin, and Voltaire and his niece were allowed to continue their journey to Mayence. It was not long after this adventure of Frankfort, while the memory of the treatment which he had received from the King of Prussia was fresh, that Voltaire wrote those 'Mémoires' which are disgraceful to himself, and affix infamy on the name of Frederick. It is said that he kept the manuscript by him, but that two copies were made without his knowledge, a statement which is not credible. Upon his subsequent reconciliation with the king, it is said that he burnt

Digitized by Google

the manuscript; but one of the two copies, thus surreptitiously obtained, was printed among his posthumous works.

After a short time Voltaire fixed himself at Colmar for a few months (1754), while Madame Denis was at Paris for the purpose of ascertaining if he could safely return there. A new trouble now befel him. A Dutch bookseller, who had obtained in some way, but it is not said how, an unfinished manuscript of the 'Essai sur les Mœurs et l'Esprit des Nations,' published it under the title of 'Abrégé d'Histoire Universelle, par M. de Voltaire.' Some parts which had been purposely suppressed by the Dutch publisher made the work appear an attack on crowned heads and priests. Voltaire got the genuine manuscript from Paris, and showed by a comparison of the two manuscripts, formally drawn up by a notary, that the passages had been suppressed with a malignant design to injure him. This story is one many respects very improbable: Voltaire had never had any scruples about publishing his works under assumed names, or denying the authorship of anything when it suited his purpose; and it is not easy to conjecture how his manuscript should get abroad without his consent, or that the real manuscript should have been left at Paris, and that he should be able to recover it. The difficulty is hardly diminished if we assume that Voltaire had possessed two copies of the manuscript. In fact, the mode in which this manuscript fell, as it is said, into the hands of the Dutch publisher, is left unexplained.

At length wearied with his rambling, unsettled life, after spending a few years in the territory of Lausanne and in that of Geneva he bought an estate at Tourney and another at Ferney, both in the Pays de Gex, and he finally settled at Ferney, where he spent the last twenty years of his life in as much authority as his character would allow. He rebuilt the house, laid out gardens, kept a good table, and had crowds of visitors from all parts of Europe. His passion for the stage was unabated. He had a small theatre, in which he sometimes acted himself, and occasionally procured the services of the first actors of the day. He was also a benefactor to the neighbourhood. A little town grew up around him out of a miserable village; new houses were built at his own cost; and he encouraged and produced a body of skilful artisans who became celebrated through all Europe. He even rebuilt the church at his own expense. But his hasty proceedings in this matter brought him into difficulties. He had neglected certain necessary forms in his demolition of the old church, and ordered a large wooden crucifix, which stood in front of the porch, to be thrown down. He even went so far as to preach a sermon in the church against theft. Complaint was made to the bishop of the diocese of these irregularities, and Voltaire, in order to quiet matters, went through the ceremony of taking the communion in the church of Ferney; an act of undoubted hypocrisy, which however was not the only one of which he was guilty. In the following year, 1769, the bishop of Annecy had forbidden all priests to confess him, give him absolution, or allow him to take the communion. Upon this Voltaire took to his bed, pretended he was dying, and compelled a Capuchin to administer to him all the offices of the Roman Catholic Church which a true believer could claim. The whole farce was certified on the spot by a notary. The philosophers of Paris, whose anti-religious opinions went beyond those of Voltaire, looked on him with contempt, and all pious Christians were shocked by the hypocritical impiety of an old man who was now upwards of seventy years of age.

During his long residence at Ferney, Voltaire's literary activity was untiring. His rancour against priests and the Christian religion was now grown inveterate; and in the retirement of his old age he poured forth an unceasing torrent of ridicule, invective, and ribaldry against all that believers in revelation hold most sacred, and which therefore rubbed their belief generally tree with decent respect. His works appeared under various names, and he never scrupled to disavow them when he found it convenient, though such disavowals must have been useless, inasmuch as nobody can mistake the authorship of anything that Voltaire has written. The poem of the 'Pucelle,' which he had commenced about 1730, added to the number of his enemies. Its indecency and the ridicule of sacred things shocked all sober people; but it was the satirical allusions to living persons that raised up the most active enmity against the author. It is probable enough, as he says, that he never intended to print it in its original form; but it was well known to his friends, who had copies of some cantos, and parts of it had been recited in various companies. About 1755 it appeared in print at Frankfort, though with the title of Louvain, and Voltaire disavowed it. As usual, it had been printed from a copy which had been stolen from the author or his friends ('Advertissement des éditeurs de l'édition de Kehl'), a misfortune to which the works of Voltaire seem to have been peculiarly exposed; it is also said that it contained verses which Voltaire had not written, and, what is more probable, "other verses which he could not allow to stand, because the circumstances to which these verses alluded were changed." Several other editions appeared without Voltaire's consent; one at London in 1757, and another at Paris in 1759. It was not till 1762 that Voltaire published an edition of the 'Pucelle,' which was very different from all the others, and purged of much that was offensive: it was reprinted in 1774, with some alterations and considerable additions, and this is the text of the 'Pucelle' which now appears in the best editions.

His literary quarrels and his extensive correspondence also furnished the old age of Voltaire with constant employment. He had created a host of enemies, and he had to defend himself against their incessant attacks. He poured upon them invective and ridicule, without measure and without shame. He had generously offered Rousseau an asylum in his house, while he was persecuted for his 'Emile.' Rousseau refused the offer with his usual brutality, and Voltaire repaid him with a torrent of abuse. His correspondence during his residence at Ferney forms a valuable part of his works. He contributed some literary articles to the 'Encyclopédie,' which was then publishing at Paris under the direction of D'Alembert and Diderot. His correspondence with D'Alembert on the 'Encyclopédie' is exceedingly interesting; it assists us in forming some idea of the state of France at that time, in which a so-called philosophic party, inconsiderable in numbers, was opposed to a large majority of ignorant bigots and superstitious fools, with libertines. There was enough of superstition and intolerance to excite the contempt and rouse the indignation of all reflecting men, and in estimating the character of Voltaire it should never be forgotten what the state of society then was. He had become reconciled to his old pupil Frederick, and kept up a correspondence with him, though he "forgot" to burn the unfortunate 'Mémoires.' He also corresponded with the empress Catherine II. of Russia, whose letters to Voltaire are some of the most agreeable in the whole collection.

But he had other occupations in his retirement, which show us another and more pleasing side of his character. He heard that a grand-niece of the dramatist Corneille was in distress. She was invited to Ferney, where she received a good, and it is said "even a Christian education," though the exact meaning of this expression may be doubted. To render her in some measure independent of him, Voltaire undertook an edition of her ancestor's plays with notes; and the profits of the undertaking were given to her for her marriage portion. The affair of Calas is well known. This unfortunate old man, who was a Calvinist, was convicted at Toulouse (1762) of murdering his son, and the alleged motive was his fervent endeavouring the Roman Catholic faith. The father was broken on the wheel, and the family came to Geneva for refuge. Voltaire received them kindly. He made himself acquainted with the facts of this horrible case, and was convinced that Calas was innocent. He resolved that justice should be done to the unfortunate family, and he never rested till he had accomplished this. His personal exertions, his purse, and his pen were employed in a cause which was worthy of his best powers. If his hatred of fanaticism stimulated his exertions, it must be allowed that his generous feelings had been sufficiently roused. The sentence of the parliament of Toulouse was annulled, and the Duc de Choiseul, who was then in power, made amends to the family of Calas, so far as reparation could be made, out of the public treasury, for the wrongs done to them by an ignorant and bigoted tribunal.

Voltaire was now eighty-four years of age. His niece, Madame Denis, who was weary of her long retirement at Ferney, persuaded him to visit Paris. He arrived there on the 10th of February 1778, and was received with enthusiasm by all classes, except by the court and the clergy. A succession of visitors crowded his apartments, and he was kept in a state of constant excitement. A violent hemorrhage came on and threatened his life, and he sought a reconciliation with the church; he said he did not wish his body to be deprived of Christian burial. The Abbé Gauthier obtained from him a declaration that he would die in the Roman Catholic faith, and that he asked pardon of God and the church for his sins. His disorder abated, and he transferred his thoughts from the church to the theatre, where he had been the most frequent visitor since his arrival in Paris. On the evening of the day on which he was present at a sitting of the Académie, he attended the sixth representation of his tragedy of 'Irene.' Between the two pieces his bust was placed on the stage and crowned by all the actors. From the theatre he was accompanied to his hotel by crowds, who cheered him loudly, and called out the titles of his principal works, among which the 'Pucelle' was not forgotten. Turning to them, he said, "You will stifle me with roses." He was detained at Paris longer than he intended, chiefly owing to the management of his niece, who could not bear to return to the solitude of Ferney; but the delay was fatal. Voltaire's feeble frame was exhausted by this round of excitement; and his literary labours, which he still continued, and the immoderate use of coffee, brought on a strangury, to which he had been subject. Seeing that his strength was failing, the Abbé Mignot, his nephew, brought to him the curé of St. Sulpice and the Abbé Gauthier. The details of his death-bed are contradictory: he seems to have been exhausted, and only to have wished to die quietly. The Abbé Gauthier signed a paper, in which he declared that he was sent for at the request of Voltaire, but found him too far gone to be confessed. He died on the 30th of May 1778. The curé of St. Sulpice officially refused to inter the body of Voltaire, but at the same time he renounced all his rights in the matter. The body was taken by night to the Abbey of Scellières, which Mignot had in commendam, where it was buried, on the production of the renunciation of the curé of St. Sulpice, the certificate of the Abbé Gauthier, and a profession of 'faith Catholic, Apostolic, and Roman,' made by Voltaire about six weeks before his death. The bishop of Troyes, Joseph de Barral, hearing that it was intended to bury Voltaire in the Abbey of Scellières, issued an order, dated the 2nd June 1778, to the

Digitized by Google

prior, by which he forbade the interment. The order came too late, for the funeral was over; but the prior lost his place. The letter of the prior, in reply to the bishop, states all the circumstances of the funeral, and the grounds on which he considered the body entitled to Christian burial. The bones of Voltaire remained undisturbed till the Revolution, when they were brought back to Paris and interred in the Pantheon.

The works of Voltaire are thus arranged in the edition of Lequien, Paris, 70 volumes, 8vo, 1820, of which the last volume consists of a copious index. 'Vie de Voltaire, par le Marquis de Condorcet, Mémoires,' &c.; vol. i.; 'Théâtre,' vols. ii.-ix., containing his tragedies and comedies; 'Discours sur la Tragédie,' addressed to Lord Bolingbroke; the translation of Shakspere's 'Julius Cæsar,' &c.; 'La Henriade,' vol. x., with the prefaces of the King of Prussia and Marmontel; 'Pucelle,' vol. xi.; 'Poesies,' vols. xii.-xiv., containing his odes and his miscellaneous poems, which are very numerous; 'Essais sur les Mœurs,' vols. xv.-xviii.; 'Siècle de Louis XIV.' vols. xix. xx.; 'Siècle de Louis XV.' vol. xxi.; 'Histoire de Charles XII., vol. xxii.; 'Histoire de Russie,' vol. xxiii.; 'Annales de l'Empire,' vol. xxiv.; 'Histoire du Parlement,' vol. xxv.; 'Mélanges Historiques,' vols. xxvi., xxvii.; 'Politiques et Législation,' vols. xxviii. xxix. of which the latter contains a full account of the affair of Calas; 'Physique,' vol. xxx, which contains his physical writings, which were composed during his intimacy with Madame du Chastellet. Among these is his 'Elémens de la Philosophie de Newton,' dedicated to Madame du Chastellet. At the time when this work was written almost all the French philosophers were Cartesians; Maupertuis and Clairaut, both of whom were then very young, were exceptions; 'Philosophie,' vols. xxxi.-xxxiv., containing his metaphysical writings; 'La Bible expliquée,' &c. His attacks on Christianity are not expressed with much heat, and he is guilty of gross perversion of facts. His judgment of the philosophical writings of others is neither exact nor profound. He calls Spinoza an atheist, which he was not. Voltaire, though a deist, professed a great horror of atheism; and in reading all his philosophical and anti-religious works, it is necessary to bear this in mind. It is a great mistake to confound him with the professed atheists of his day, whom he hated, or at least affected to hate, and who viewed his deism with contempt. 'Dialogues,' vol. xxxv.; 'Dictionnaire Philosophique,' vols. xxxvi.-xlii., a work which shows his extensive and discursive reading, his fertility of invention, and his inveterate prejudices; 'Romans,' xliii. xliv., which are among his most amusing works, though in many respects far from being unexceptionable; 'Facéties,' vol. xlv., containing among other things, 'Les Questions sur les Miracles,' in letters, the first of which appeared in 1765, and the last after the essay of Hume. There is nothing new in the objections of Voltaire, which are in substance that God governs by unchangeable laws, and that we cannot suppose that he permits any deviations from them. 'Mélanges Littéraires,' vols. xlvi. xlvii.; 'Commentaires sur Corneille,' vols. xlviii., xlix.; 'Correspondance avec le Roi de Prusse,' vols. l.-lii.; the first letter is from the Prince-Royal, dated Berlin, 8th August 1736; the last in this collection is from Voltaire, dated Paris, 1st of April 1778, about two months before his death. 'Correspondance avec l'Impératrice de Russie Catherine II.,' vol. liii.; 'Correspondance avec D'Alembert,' vols. liv. lv.: these three volumes are perhaps the most amusing part of his correspondence. 'Correspondance Générale,' vols. lvi.-lxix.; containing letters to and from a great number of persons of rank and literary distinction.

To estimate the character of Voltaire correctly, and his influence on the age in which he lived, would furnish materials for a large volume. He has been the subject of almost unqualified panegyric and of unqualified abuse, but he deserves neither. Education, temperament, and circumstances placed him in opposition to established institutions; his labours were directed to destroy, not to reform or rebuild. No man saw more clearly the vicious and absurd parts of existing institutions; but he could not appreciate the value of that which had been tested by experience. He had no veneration for antiquity. His habit of viewing the ridiculous side of things became so strong as to close his eyes to palpable truths. He was the great Coryphæus of deism, and he fulfilled the prophecy of his preceptor. It is not true, as it has been sometimes said, that his object was solely to root out superstition and to annihilate the power of the church. His panegyrist Condorcet distinctly states that his avowed object was to destroy Christianity, and his sceptical writings render such avowal unnecessary: this is their manifest design. He had no deep convictions, except we allow to be such his belief that a man could not perpetrate the crime that Calas was charged with, and a vague indefinite notion that human nature was better than priests and bigots supposed it to be. He had not the simplicity and sincerity of character that belong to truly great minds, and he was apparently incapable of friendship or of strong attachment, though some instances are alleged in which he retained his friendships to the close of his life. His moral character partook of the vices of the age to which he belonged; his intellectual was above it. The faults of his character pervade his writings. As a poet, he fails to move the passions strongly, nor does he touch the more delicate sympathies of our nature. His dramatic writings are defective as dramas, if we measure them by our standard of excellence. He had studied Shakspere, and he allowed him some merit, but he preferred Corneille; and some of the most undoubted characteristics of Shakspere's great dramatic art appeared to the poet of the age of Louis XV. merely the traits of a barbarous age. Yet his dramatic conception is often just and vigorous; many of his scenes have great artistic merit, and he abounds in lofty truths and generous sentiments. But an affectation of philosophy is the fault of all his writings; he would always be inculcating what he considered to be great truths, and thus we have Voltaire always before us. It is an essential of dramatic art, that the author shall never appear; but in all his writings Voltaire is always apparent.

The 'Henriade' of Voltaire is still the only French epic. The subject is the siege of Paris, which was commenced by Henri III. and Henri of Navarre, afterwards Henri IV., who finally entered the city. The action is confined to Paris and the field of Ivry, which decided the fortunes of Henri IV. It has accordingly an historical basis and the main events are made conformable to historic truth; its poetic part consists of fictions intended to aid the development of the action, and of allegories, which are feeble aids, such as the journey of Discord to Rome, and the Temple of Love. Its machinery is neither original nor grand, and it is deficient in striking events. It contains a love episode, the amours of Henri and La Belle Gabrielle, which might as well have been a separate poem for any connection it has with the main subject. The 'Henriade' has been variously judged even by French critics, and the rest of Europe has pronounced on the whole an unfavourable opinion. The author worked much and long upon it; for he had the ambition of writing a monument which should stand by the side of the epic poems of Greece and Italy. To deny it all merit would be absurd; it contains many fine and vigorous passages, but of all the longer works of Voltaire it is perhaps that which, to a foreigner at least, is the most tedious, except the 'Guerre Civile de Genève,' the dullest of all his productions.

His 'Pucelle d'Orléans' has been already mentioned. The subject, if one can describe such a subject in a few words, is Jeanne d'Arc, the Maid of Orleans. The poem commences with the loves of King Charles VII. and Agnes Sorel, and the siege of Orleans by the English. Jeanne is armed by St. Dionysius, and goes to King Charles at Tours. The poem concludes, after many adventures, with the triumph of Charles. Voltaire aimed to rival Ariosto, but it is universally agreed that he has not approached him. Even in its present form the idea that 'Pucelle' is one of the best productions of modern times, for the corrections of the author principally related to the satirical allusions. All things serious and sacred are treated with ridicule. The poet riots in his licence, and seems to exult in his contempt of decencies and religion. Proportion of time, place, and circumstance—all are disregarded; the 'Pucelle' is the reflection of Voltaire in his most lively and most extravagant mood. The poem has great merits in detail; the versification is easy, and many of the descriptions are beautiful: the exordiums of each canto are justly admired. But the 'Pucelle' has fixed a stain on the moral character of Voltaire, for which all its beauties cannot atone.

The fertility and facility of Voltaire were unequalled. His great and discursive reading supplied him with an infinite variety of matter, which he moulded into every variety of form. His satire and his sarcasm, and his sneer, were always ready and always effective. He seldom rises to eloquence, because he is not impassioned and sincere. But he never sinks into triviality: he is never tiresome; he is always lively and amusing. Clearness and precision characterise all his writings. When he is superficial, which is often the case, it is rather for want of taking pains to examine his subject with sufficient care, than from want of power to comprehend it. We must except the cases where his passions were concerned, and where prejudices had become inveterate. Passion filled him with malice and bitterness, and sometimes made him blind. His historical writings and essays have great merit. He sketched with rapidity and force: he selected what was pertinent and characteristic; he omitted what was trivial and useless. He set the example of a better handling of the materials of history: he was judiciously sceptical, though sometimes, from deficient knowledge and prejudice, unwisely incredulous. He had no exact knowledge of antiquity, or even of the Middle Ages; yet his criticism sometimes sheds a ray of light where the dulness of mere learning has left nothing but darkness. His writings contributed greatly to the enlightenment of the penal laws of France, and to the destruction of many absurd prejudices. That they tended to destroy also many of those notions on which society reposes for its safety, is not and cannot be denied. The prodigious activity and unwearied industry of Voltaire, his long and brilliant career of literary success, and the influence which he exercised on his own generation and that which immediately followed, have made him one of the most conspicuous personages of the 18th century. He has still many readers, and probably will always have some. His best writings please by the mere charm of form, independent of the matter, and they are stamped with the impress which genius alone can give. The influence of his opinions is probably not great at present. He is not the writer for all ages: he belonged to his own age, and that is passed. [*See* SUPPLEMENT.]

VOLTERRA, DANIELE DI. [RICCIARELLI, DANIELE.]

VON VISIN. [VISIN, VON.]

VONDEL, JOOST VON DEN, the great national poet of Holland, was born November 17th, 1587, at Cologne, to which city his parents had retired from Antwerp, in order to avoid the persecution to which, being Anabaptists, they were exposed from the religious severity and jealousy of the Austrian Spanish government. As soon however as the republic of the United Provinces was established, the family removed to Amsterdam, where Vondel continued to reside during his very long life. The education he received from his parents did not extend beyond the ordinary acquirement of reading and writing; for his father was only a tradesman, as he was afterwards himself, dealing in hosiery as his ostensible business, though making poetry his serious occupation. How he contrived to reconcile literary study with business we are not informed; but there is reason for supposing that his attention to the first rather shielded his success in the latter, since he seems to have been far from prosperous in trade as a hosier. For poetry he is said to have evinced a taste very early, and even to have given evidence of his poetic talent when he was no more than thirteen. It was not however until he had reached double that age that he began to study Latin. Not only was his proficiency in the language rapid, but a decided improvement, both as to style and ideas, it is said, soon began to manifest itself in his compositions; yet in proportion as he caught the tone as well as the spirit of the ancients, he probably lost originality of invention and freshness of feeling. His tragedies, which form so considerable a portion and so important a class of his productions, show him to have possessed far higher genius as a lyric poet than as a dramatist; for they owe their chief attraction to the 'Reien,' or choruses with which they are interspersed, and many of which are splendid lyrical pieces; in them, in fact, he seems to give us the loftiest flights of Vondel's genius, and which constitute his chief attractions for modern readers. A selection of them was made by De Vries, who published it in 1820. Among the more celebrated of his dramatic poems are his 'Palamedes,' 'Gijsbrecht van Amstel,' and 'Lucifer.' The first of these, which was a direct allusion to the fate of the grand-pensionary Barneveldt [BARNEVELDT], obtained for its author both political and literary distinction; for though not published till the Prince Maurice's death, in 1625, it was prosecuted by those in power as treasonable, and as libellous on the memory of that prince, and it was only with great difficulty that Vondel escaped severer punishment than a fine of 300 guldens. On the other hand it obtained for him the highest renown both as a patriot and a poet, and passed through thirty editions in the course of a few years. The 'Gijsbrecht,' which was written by him for the opening of the new theatre at Amsterdam, in 1637, is justly considered one of his masterpieces, and is also, of all his dramas, that which is most national in its subject. That however which possesses for us as Englishmen almost the charm of nationality, is his 'Lucifer,' for it may be considered the precursor of our 'Paradise Lost,' which it anticipated by fourteen years; consequently for its Miltonic grandeur and inspiration it is not at all indebted to the work of the English bard, nor is there reason to suppose that Milton kindled his flame at that of his illustrious contemporary. Milton and Vondel were kindred spirits.

To enumerate here chronologically all the productions of Vondel, not in the drama alone, but in almost every other species of poetical composition, would be useless. It will therefore specify one performance, which, had he completed it, might alone have secured for him the reputation of an epic poet, namely, a poem, of which Constantine the Great was the hero, and which he began in 1632; but the death of his wife shortly afterwards, caused him to abandon the subject, and, lest he should be tempted to resume it, he destroyed the manuscript. The loss of his wife was indeed a severe blow to him, for it was she who had chiefly attended to the concerns of their business. From that time his circumstances grew worse, and his embarrassments were afterwards so much increased by the conduct of a spendthrift son, that at the age of seventy-two he was glad to obtain a situation with a small salary in a bank at Amsterdam. Even there however neither his energy nor his genius deserted him, for it was at this period that he composed, besides several other things, his 'Jephtha,' one of the best and the most regular of his tragedies. At length, in 1663, he was permitted to retire, retaining his salary as a pension for life; and, notwithstanding his then advanced age, he lived to enjoy it many years, for he did not die until February 5, 1679, when he had attained a length of days which entitles him to be classed among the patriarchs of literature and art.

VOPISCUS, FLAVIUS. [AUGUSTA HISTORIA.]

VORONIKHIN, ANDREI NIKOPHOROVICH, a Russian architect, was born in 1760, among the peasantry of Count Alexander Stroganov, who, having detected in him a taste for drawing, sent him, in 1777, to Moscow, in order to be properly educated as an artist, and he there received some instruction from Bazhenov and Kazakov, two eminent architects. He was then sent to travel with his patron's son, Count Paul Stroganov, and after visiting the southern provinces of Russia, Germany, and Switzerland, resided for some time at Paris, diligently profiting by the opportunities there afforded of pursuing his architectural studies. In 1790 he returned to St. Petersburg, where Stroganov's protection soon brought him into notice, and obtained for him employment. More employment however, without more than ordinary opportunities, can hardly lead to architectural fame; it was therefore fortunate for Voronikhin that such opportunity was given him in the erection of what is still one of the finest monuments of the northern capital of Russia. It was in 1800 that the Emperor Paul conceived the idea of building a magnificent cathedral in the 'Nevskii Prospect,' to be dedicated to 'Our Lady of Kazan;' and Voronikhin, who was then professor at the Academy of Arts, was appointed architect. In the following year the first stone was laid by the Emperor Alexander, and the edifice was completed and solemnly consecrated in September 1811. Criticism has not been sparing of its remarks on this piece of architecture; because the principal façade is extended by a semicircular colonnade it has been called a copy of St. Peter's at Rome on a reduced scale, whereas there is no other point of similarity between the two buildings. Although Voronikhin is said to have erected a great many other buildings, both public and private, we have no sufficient account nor even a complete list of them; among them however are said to be the colonnade in the gardens at Peterhof, the terraces, &c. at Strelna, and several villas at Gatchina and Pavlovsky. Voronikhin died rather suddenly, Feb. 21 (March 5), 1814.

VORONTSOV. [WORONZOW.]

VÖRÖSMARTY, MIHALY or MICHAEL, an eminent Hungarian poet and prose writer, was born at Nyér in the county of Fejervár, called by the Germans Stuhlweissenburg, in the year 1800. His family, originally from the lost early, was reduced to a nobleman. Michael went in 1817 to Pesth to study law, and in 1824 he was admitted as an advocate, but he early adopted literature as a profession. In 1821 appeared his first drama, 'King Solomon,' founded on the History of King Solomon of Hungary, and in 1824 another drama, 'King Sigismund,' both of which, in 1825, was published his romantic poem of the 'Triumph of Fidelity.' It was as an epic poet that he attained the greatest celebrity: his 'Zalan Futásа,' or Flight of Zalan, his 'Csarhalom,' and his 'Tündervölgy,' or Enchanted Valley, the first published in 1824 and the last in 1837, are considered the finest narrative poems in the Hungarian language. For some years Vörösmarty was editor of the 'Tudomanyos Gyüjtemény,' or Repository of Science, a monthly magazine, which lasted under his guidance and that of others for a quarter of a century, and was during its continuance the chief organ of Hungarian intellectual literature. He was afterwards concerned with Bajza and Schedel in the editorship of the 'Athenæum,' a periodical not unlike the London 'Athenæum,' which had for a time great and deserved success. In 1830, on the establishment of the Hungarian Academy at Pesth, he was appointed one of the members, and soon afterwards its secretary, and for some years his life flowed in an unbroken course of literary labours and literary fame. In general his reputation stood higher among the educated classes than among the people; but one of his lyric poems, the 'Szózat,' or Appeal, written in 1840, enjoyed a double national existence; it rose at once to a strong popularity among the people, like that of the 'Marseillaise' in France, and the Hungarian Academy presented the poet with a ducat for every line. Some of the lines of the 'Szózat,' the subject of which is the fate and prospects of the Hungarian nation, have since acquired a melancholy increase of significance:—

> "For come there will, and some there must,
> To us a better time.
>
> "And if it come not, then come Death
> To end our dark career,
> And be our country, drenched in blood,
> Laid on a glorious bier."

It was natural that at the outbreak of the revolution of 1848 the poet of the 'Szózat' should be called on to take a part, and he was elected deputy for the county of Bacska. His course in the Assembly however was far from meeting the approval of some of the more fiery patriots. The popular and impetuous Pulszky, the Hungarian Burke, was so indignant at one of Vörösmarty's votes that in a poetical address to him he renounced his friendship. [PETÖFI.] On the final triumph of the Austrians Vörösmarty was brought to trial, and condemned as a member of some of the revolutionary committees, but was released and pardoned after a short imprisonment. Such however was the effect produced upon him by the calamities of his country, that he sunk into a deep melancholy, and lived for two or three years in retirement, without suffering pen and paper to come in his sight. Roused from this by the events in 1854, his friends found him in the state of depression, and he undertook a translation of Shakspere, some of whose plays he had rendered into Hungarian in happier days. The task was still not completed when Vörösmarty died at Pesth, on the 9th of November 1856.

A collection of the works of Vörösmarty was issued by his friends Bajza and Schedel as part of the collection of the Hungarian classics, entitled the 'Nemzeti Könyvtar,' or National Library. It was published in 1847. The divisions adopted for the writings are Lyric Poetry, Narrative Poems, Dramas, More Recent Poetry, Novels and Tales, and Miscellaneous Writings in Prose, which are subdivided into Essays on Language and Literature, and Dramatic Criticisms. The whole are comprised in one thick octavo volume, printed in double columns, but would occupy nine or ten ordinary octavos. Vörösmarty's writings are more distinguished for classical correctness of form than for striking originality of substance. His narrative poems

Digitized by Google

are written in hexameters on the classical model, for which the Hungarian is perhaps better adapted than any other modern language. His lyric as well as his epic poetry is estimated at a high value by native critics; but the very qualities that excite their admiration render their beauties difficult of transfer.

VORST, or, Latinised, VORSTIUS, CONRAD, a celebrated German divine, was born at Cologne on the 19th of July 1569. At the time of his birth his family belonged to the Roman Catholic Church, but some years after his father, with his whole family, consisting of his wife and ten children, secretly embraced the Protestant religion. After having received his preparatory education in a village near Cologne, Conrad was sent to Düsseldorf, where he studied from 1583 till 1586. He continued his studies at Cologne, but was prevented taking his degree, partly because he could not subscribe the decisions of the Council of Trent, and partly because his father's means were not sufficient to allow his son to go to a Protestant university. For a time therefore his learned pursuits were abandoned, and Vorstius began to prepare himself for a mercantile life. What enabled him afterwards to continue his studies is not said, but in 1589 he went to Herborn, where he devoted himself with great success to the study of theology under the famous Piscator. During his stay there he gained his living principally by giving private instruction, and in 1593 he went with some of his pupils to Heidelberg, where he was honoured the year after with the degree of Doctor of Divinity. In 1595 he visited the universities of Switzerland, where he took a part in some of the theological controversies which were then carried on there. For some time he delivered lectures at Geneva, which were so well received that the regular professorship of divinity was offered to him in that university. But about this time Count Arnold of Bentheim had founded a great school of divinity at Steinfurt, and he invited Vorstius to a professorship, which he accepted. He soon acquired a great reputation, and received very honourable invitations from several universities; but all offers were refused, partly because his own family did not wish him to go to any great distance from them, and partly because Count Arnold was unwilling to part with him. The generous way with which Vorstius complied with the count's request was afterwards very honourably rewarded, for Vorstius was raised to the highest ecclesiastical office in the count's dominions. About the year 1598 a report got abroad that Vorstius had expressed himself in favour of the doctrines of Socinus. The count hearing of it began to be alarmed, and requested Vorstius to go to Heidelberg and clear himself of the charge before the faculty, which had conferred upon him the degree of Doctor of Divinity. Vorstius succeeded in clearing himself of Socinianism, but was obliged to own that he had expressed himself in which might seem to justify the charge. After having expressed his regret, and solemnly declared his abhorrence of the opinions of Socinus, he returned to Steinfurt. Although he had thus outwardly cleared himself, the suspicion which had once been raised could not be allayed. The matter was brought to a crisis when, in 1610, he received an invitation to the professorship of theology at Leyden, which had become vacant by the death of Arminius. Vorstius, after some consideration, accepted the offer, although he was well aware of the difficulties which he would have to encounter; but he was very much pressed by the followers of Arminius, and he also hoped to find a wider field for the free exercise of his powers than in the small principality of Bentheim. He went to Leyden provided with the most satisfactory testimonials respecting his orthodoxy and his conduct; but his appointment alarmed the Calvinistic party at Leyden and in Holland generally. They protested most vehemently against the appointment, and even solicited the interference of foreign universities, and of James I., king of England. The work of Vorstius on which their fears and accusations were chiefly founded was a collection of dissertations which he had published at Steinfurt, in 1610, under the title 'De Deo, seu Disputationes decem de Natura et Attributis Dei, diverso tempore Steinfurti habitæ.' This book was attacked more fiercely than even the Koran had been by any Christian writer. King James I., after having read the book, found it full of heresies, and had it publicly burnt at Oxford, Cambridge, and London; and he recommended the States of Holland not to tolerate such a heretic within their territory. The States instituted an investigation, and as the contest grew hotter every day, Vorstius was obliged to quit Holland and wait for the final decision in another country. The King of England in the mean time wrote a tract against the unfortunate professor, declared that burning was much too mild a punishment for him, and threatened to make all orthodox Protestants to unite their strength against the Arminian heresies. The synod of Dortrecht at length, in 1619, brought the matter to a close; and it is said to have been chiefly owing to the influence of the English deputies at this synod that Vorstius was declared unworthy of the office to which he had been appointed, and exiled from Holland for ever. For two years Vorstius and his family lived in concealment, and his life was threatened more than once by persons who thought it a religious duty to kill a man who was capable of doing so much injury to the Christian religion. At last the Duke of Holstein offered Vorstius and the scattered remnants of the Arminians a place of refuge in his own duchy, and assigned to them a tract of land, on which they built the town of Friedrichstadt. Vorstius arrived in Holstein in the summer of 1622, but he was taken ill soon after, and died on the 29th of September of the same year at Tönningen. His body was carried to Friedrichstadt, and buried honourably.

Vorstius was a pious and devout man. There is no evidence whatever that he had adopted the Arminian doctrines previous to his going to Leyden. Bayle justly remarks that the persecutions of his enemies for errors of which he was not guilty drove him into them; for that he was an Arminian during the last period of his life is attested by his own evidence. Vorstius was a man of considerable learning, great independence of mind, and of sound judgment. He wrote a great number of works, most of which are of a controversial nature, and directed partly against the doctrines of the Church of Rome, and partly against his opponents among the Protestants. Some few are of a devotional and religious character. Most of them are written in Latin, some in German, and some in Dutch. Lists of them are given in Jöcher's 'Allgemeines Gelehrten-Lexicon,' and in Bayle's 'Dictionnaire Historique et Critique.'

(Sandius, *Bibliotheca Antitrinitariorum*; Guaiterus, *Oratio in obitum Conradi Vorstii*.)

VOS, MARTIN DE, one of the most remarkable painters of his time, was born at Antwerp in 1530, or more probably 1531. His father, Peter de Vos, who was likewise a painter and a member of the Academy of Antwerp, gave him the first instruction in his art, and he afterwards attended the school of the celebrated Frans Floris. From the school of Floris he went to Italy, where he studied some time at Rome, and at Venice with Tintoretto, whose style he adopted, and for whom he painted several landscapes as backgrounds to some of his pictures. He distinguished himself in history and portrait, and painted many portraits for the house of Medici. After a stay of eight years in Italy he returned to Antwerp, and brought home with him, besides a number of his own collection of works, large pictures, ancient vases, &c., from Greek and Roman monuments, which he made use of to great advantage in several pictures of feasts and such subjects. In 1559, shortly after his return, he was made a member of the Academy of Antwerp. He executed an immense number of works: there are more than six hundred prints after his designs; he painted more pictures than any man of his time. He amassed a considerable fortune, and died December 4th, 1603; or, according to the common account, in 1604.

Vos had great ability, and many of his great pictures are composed, designed, and coloured in a masterly style, yet his figures, like those of his model Tintoretto, are often forced and exaggerated in their attitudes. He formed a good school, and educated several excellent scholars; the most distinguished were his nephew William de Vos, and Abraham Janssens Roeberg or Coebergen.

William de Vos was one of the painters whose portraits were painted by Vandyck for the collection of the distinguished artists of his time. There were several other painters of this name, of the same and of different families. There was a Peter de Vos, the brother of Martin; a Simon de Vos (born at Antwerp in 1603, and died in 1662), the scholar of Rubens, who excelled in portrait and in animal painting; a Paul de Vos (born at Aelst about 1600, died in 1654), a celebrated battle-painter, and his son Cornelius, who was a good historical painter, he died at Antwerp in 1724, aged sixty-one. There was another Cornelius de Vos, who studied under and imitated Vandyck; and there was also a Lambert de Vos of Mechlin, who, in 1574, went to Turkey and made many excellent water-colour drawings of Turkish costume. A volume of these drawings upon Turkish paper is or was in the gymnasium library of Bremen.

VOSS, JOHANN HEINRICH, was born on the 20th of February 1751, at Sommersdorf, near Wahren in Mecklenburg. His father was originally a farmer; but, soon after the birth of his son, he got the office of collector of the tolls for Count Malzahn in the little town of Penzlin, and had a house and the privilege of brewing and distilling. In this place Johann Heinrich received his first education. He showed such an extraordinary memory and such a desire to learn, that his father, although his circumstances were continually growing worse, sent him to the public school at Neu-Brandenburg. Benevolent friends and relatives contributed towards the expenses of his education, as he showed all the signs of extraordinary talent. Greek was then taught at Neu-Brandenburg in a very unsatisfactory way. Voss was only 15; and being quite charmed with the beauties of that language, he and some of his schoolfellows had their weekly meetings, in which they communicated to one another what they had learned in private, and thus studied the Greek writers themselves. German poetry also was read and discussed at these meetings, and Voss already commenced writing German poetry which attracted the attention of his friends and acquaintances. After having been at Neu-Brandenburg for two years, he saw that a longer stay would be useless; and as he had no means of continuing his studies at a university, he at last accepted a place as private tutor in the family of a country gentleman near Penzlin. He entered this situation in 1769. As he had not yet been at a university, his salary was less than that of the cook in the family; and he had to endure many humiliations which might have broken his spirits if he had not thought it his duty to hold out in order to get a small sum which might enable him at least to begin his academical career. Another circumstance which helped him over the difficulties of his position was the friendship of a neighbouring clergyman, who saw the great talents of Voss, made him

Digitized by Google

acquainted with the German poets, and drew his attention to Shakspere, to understand whose works Voss immediately began to learn English. Boie, who was then the editor of the 'Göttinger Musenalmanach,' received some of Voss's poems as contributions, and was so pleased with them, that he invited the author to come to Göttingen, where he promised him all the assistance in his power. After repeated invitations Voss went, in 1772, to Göttingen, where, through the mediation of Boie, he obtained free board (Freitisch), and also the means of making a small income. Here Voss became acquainted with Heyne, who received him as a member of the philological seminary. The influence of Boie and of the numerous circle of aspiring young men then assembled at Göttingen, who formed a society under the name of Hainbund, for the purpose of cultivating poetry and improving the national taste, soon drew out the genius of Voss, and he took a very prominent part in the proceedings of the society. He had come to Göttingen with a view to study theology, but he changed his views and devoted himself to the study of philology, with the hope of obtaining the office of teacher in some public school. In his critical exercises in the philological seminary he occasionally differed from Heyne, and thus excited his ill-will; the consequence was that Voss did not attend the seminary so regularly as was expected, though he continued his studies the more zealously in private. This ill-feeling between Heyne and Voss was the foundation of all their subsequent disputes and enmity. During his stay at Göttingen Voss made the acquaintance of Klopstock and Claudius; and in 1774, when Boie left Göttingen, the editorship of the 'Musenalmanach' was given to him. In 1775 Voss also left the university, spent some time at Hamburg, and then went to his friend Claudius at Wandsbeck. In 1777 he married Boie's youngest sister, and the year after he was appointed rector of the public school at Otterndorf, in the county of Hadeln. Soon after settling there he announced his intention of publishing a German translation of the 'Odyssey' in hexameter verse; and in order to convince the world of his competence, he published, in 1780, a dissertation on the Island of Ortygia in the 'Deutsches Museum,' and another on the Ocean of the ancients, in the 'Göttinger Magazin,' which was edited by Forster and Lichtenberg. The peculiar mode which he adopted of writing Greek names drew upon him the severe censure and scorn of Lichtenberg, as the mode also of writing Latin did the champions of Heyne. This completed the breach between Voss and Heyne, and the disputes with Lichtenberg continued for several years, and became at last mixed up with such personalities, that Voss found it necessary to write an essay in vindication of his own character in the 'Deutsches Museum.' In 1781 Voss published his German translation of the 'Odyssey,' which was received with the unanimous approbation of all competent judges. The marshy district of Otterndorf being detrimental to the health of Voss, through the influence of his friend Count Frederic Leopold Stolberg he was invited to the rectorship of the gymnasium of Eutin. He arrived here in 1782, and his circumstances, which had hitherto been extremely limited, were soon greatly improved, and he was further honoured with the title of 'Hofrath.' Being thus in easy circumstances, he devoted his time to the discharge of his duties and to the study of the ancients, whose works it was his pride to nationalise among his countrymen. At the same time he continued to write original poems, which are among the best in the literature of Germany. In 1789 he published his edition of Virgil's 'Georgics,' with a German translation, a commentary, and several engravings representing various forms of ancient ploughs. A new and much improved edition appeared in 2 vols. 8vo, 1800. In 1793 he published his translation of the 'Iliad' and 'Odyssey,' in 4 vols. in 8vo and 4to. That of the 'Odyssey' was an improvement upon the edition already published; but although it is more correct its character is less simple than that of the first edition. During this time he was also engaged with researches on ancient geography and mythology; and in order to counteract the views on mythology proposed by G. Hermann, in his 'Handbuch der Mythologie,' which was extravagantly praised by Heyne and his friends, Voss wrote an essay on Apollo, which was soon after followed by his Letters on Mythology ('Mythologische Briefe,' 2 vols. 8vo, Königsberg, 1794), which were mainly directed against Heyne. A second and enlarged edition of these letters appeared in 3 vols. 8vo, Stuttgard, 1827. No year passed without proofs of the genius and learning of Voss. In 1797 there appeared, in 2 vols., his edition of Virgil's 'Eclogues,' which, like the 'Georgics,' was accompanied by a German translation and an excellent commentary. Two years later he published his translation of all the works of Virgil, but without a commentary. The numerous original poems, which had appeared either in small collections or in periodicals, were now collected and published in 4 vols. 8vo, 1802. This collection contains, in an appendix, an essay on German prosody ('Zeitmessung der Deutschen Sprache'). In this year he also produced a new edition of his translation of Homer, to which he added a map of the Homeric world, and a plan of the palace of Odysseus.

His intense study and incessant literary activity, together with his heavy duties as rector and teacher of the gymnasium of Eutin, and various other painful occurrences, had so much weakened his constitution that it was impossible for him to continue in his office. His physician urged the necessity of a residence in Southern Germany. Duke Peter Frederic of Holstein-Gottorp, though with great reluctance,

not only allowed Voss to resign his office, but granted him an annual pension of 600 thalers. In the autumn of 1802 Voss went to Jena, where he lived for some years in private, enjoying the friendship and esteem of the professors in that university, and of all the illustrious personages then assembled at Weimar.

It was during his stay at Jena that he wrote the review of Heyne's edition of Homer, which created a general sensation in Germany ('Jenaer Allgem. Literaturzeitung,' for May 1803). In 1805 Voss received a letter expressing the desire of the elector of Baden that he should come to Heidelberg, and give a few lectures in the university; but if his health should not permit him to accept, the elector offered him a pension of 500 florins if he would merely settle at Heidelberg. While Voss was hesitating whether he should leave all his friends at Jena and Weimar, a second letter arrived, offering him an annual pension of 1000 florins if he would settle at Heidelberg, and by his mere presence give lustre to the university. This generous offer, which raised him above all want, was gratefully accepted; and in the summer of 1805 Voss arrived at Heidelberg. The mild climate of this place, with its beautiful environs, produced a great change in him. He felt himself again cheerful and young, and with renewed ardour he devoted himself to his literary pursuits. The results were improved editions of his earlier works, as well as many new ones. His fourth and last edition of Homer appeared in 1814, in 4 vols., and his fourth and last edition of Virgil in 1821. Among the new translations of ancient writers which appeared during his residence at Heidelberg, were those of Horace (1806 and 1821), Hesiod (1806), Theocritus, Bion, and Moschus (1808), Tibullus and Lygdamus (1810), of which, in 1811, he also published the original text, corrected from manuscripts, his translation of Aristophanes (1821), and Aeschylus (1824). Voss had occasionally translated works from the English and French into German: in 1819 he determined, in conjunction with his two sons Henry and Abraham, to translate Shakspere. The work was not completed till several years after the death of Voss. This translation is not quite what it should be, but it is a proof of the bold spirit and of the unwearied activity of Voss. In 1824 he published the first volume of a work entitled 'Antisymbolik,' which was directed against the mythological work of Creuzer. The second volume was edited after the latter's death by Abraham Voss. Friedric Stolberg, who had once been a kind and sincere friend to Voss, had become a convert to the Roman Catholic religion in the year 1800; and many years afterwards, in 1819, Voss, seeing the intrigues employed by the Mystics and the Roman Catholics in Germany, wrote an essay called 'Wie ward Friedrich Stolberg ein Unfreier?' ('How Paulus's Handbook,' part iii.). This was the opening of a literary campaign against Roman Catholicism, the Protestant Mystics of Germany, and despotism and aristocratic haughtiness, for these were the causes to which Voss attributed the apostacy of Stolberg. The sensation which these attacks created divided all Germany into two parties; but both agreed that Voss treated the friend of his youth too severely, and they condemned the personalities in which he indulged. The truth is that Voss and Stolberg were each opposite natures that they could not understand each other: Voss was unable to account for the real causes of Stolberg's conduct, as has since been made evident by the letters of Stolberg. Voss died at Heidelberg, on the 30th of March 1826.

Johann Heinrich Voss is one of the most remarkable men of modern times. He possessed a generous, upright character, without the least affectation. In his family and in his relations to his friends there was a kind of patriarchal simplicity and cordiality. But it cannot be denied that his own opinions of what was right and wrong rendered him frequently blind to what was good in others, and made him appear obstinate and querulous. As a writer Voss ranks among the first that Germany can boast of. His knowledge of antiquity was immense, and the life of the ancients was nearly as familiar to him as that of his contemporaries. His commentaries on Virgil's Georgics and Eclogues are among the best that have been written on any ancient author, and Niebuhr used to say that nothing was left for any future commentator on those poems. For Voss had done all that could be desired. He is one of the great fathers of modern philology, and worthy to stand by the side of Lessing and F. A. Wolf. As a translator Voss is unrivalled, and his principles and rules laid down are still followed by the best translators in Germany. No nation of modern Europe can boast of translations of Homer, Virgil, Hesiod, and Theocritus equal to those of Voss, which are real substitutes for the originals. It was the consequence of his own peculiar nature that he was more successful in his translations of epic and idyllic, than of lyric and dramatic poetry. As a poet he must be classed among the first of his country. His expression is strong and vigorous, his sentiments true and pure, and the amiable part of the German character is perhaps not seen in any modern poet more clearly than in the poems of Voss. The simplicity and the natural charms of his idyllic poems have never been equalled by any German poet, and his epico-idyllic poem, 'Luise,' is the most beautiful production of its kind in any language. His essays have been collected under the title 'Kritische Blätter, nebst Geographischen Abhandlungen,' Stuttgard, 2 vols. 8vo, 1829.

(Paulus, *Lebens- und Todeskunden von J. H. Voss*, Heidelberg, 1826; *Briefe von J. H. Voss, nebst erläuternden Beilagen*, edited by Abraham Voss, Halberstadt, 3 vols. 8vo, 1829-33; *Leben des Dichters J. H.*

Voss, by F. E. Th. Schmid, in Voss's Poetical Works, Leipzig, 1835, p. i-xxxix.)

VOSSIUS, GERARD. As his father's name was Johannes Vossius, he called himself Gerardus Johannis Vossius, that is, Gerard Vossius, the son of John. His real family name was Vos, which he Latinised into Vossius. He was born in 1577, in the neighbonrhood of Heidelberg, whither his father, who had once resided at Roermonde, in Holland, had gone after he had embraced the Protestant religion. In the year after the birth of his son Johannes Vossius returned to Holland, and settled finally at Dortrecht. Gerard was only seven years old at the time of his father's death. He began his studies at Dortrecht, and, after having acquired a considerable knowledge of Latin and Greek and of the elements of philosophy, he went, in 1595, to the University of Leyden, where the range of his studies was considerably extended. In 1598 he took his degree in philosophy, and began to devote himself with great zeal to the study of theology, ecclesiastical history, and the Hebrew language. About the year 1600 the University of Leyden was on the point of giving Vossius a professorship, when he left the place, being invited by the town of Dortrecht to undertake the head-mastership of the public school there. Soon after his arrival at Dortrecht he married. His wife died in 1607, after having borne him three children. In about six months he married his second wife, who bore him five sons and two daughters. Of all his children none survived him except his son Isaac.

Gerard Vossius was an intimate friend of Hugo Grotius. Grotius had severely chastised the Dutch clergy in his work 'Pietas Ordinum Hollandiæ,' and Vossius, although he took the pains to avoid being entangled in the theological disputes then going on in Holland, was suspected of entertaining heretical opinions. In 1614 the professorship of theology at Steinfurt was offered to him, and owing to the hostility which some of the Dutch clergy evinced towards him, he was inclined to accept the invitation; but at the same time the rectorship of the theological college at Leyden was offered to him. Vossius accepted this distinguished post to which, some years after, the professorship of eloquence and chronology in the university was added. In 1618 he published a history of the Pelagian controversy ("Historia Pelagiana"), from which his enemies inferred that he was guilty of that heresy. A report also was spread that he was an Arminian, and a secret friend of C. Vorstius. All this increased the number and bitterness of his enemies, and the synod of Tergou was prevailed upon, in 1620, to deprive Vossius of the rectorship of the theological college at Leyden. The synod of Rotterdam, however restored him, in 1621, to his office, on condition that he should neither say nor write anything against the synod of Dortrecht, which had condemned Arminianism. During these troubles Vossius tranquilly continued his studies and literary labours. In 1622 the University of Cambridge offered him a professorship, but he yielded to the wishes of the curators of the University of Leyden, not to quit the place, and the States of Holland showed him their esteem and confidence by commissioning him to write a Latin and a Greek grammar for the use of the public schools in Holland. In 1626 another unsuccessful attempt was made to get Vossius over to England; but he continued at Leyden, where his lectures and the reputation of his learning attracted crowds of students. The work on Pelagianism, which had called forth so many enemies in Holland, gained him the favour of Archbishop Laud, who procured Vossius a prebend in the cathedral of Canterbury, the emoluments of which were to be transmitted to him at Leydan. In 1629 he came over to England to be installed, and after having been honoured with the degree of Doctor of Laws at Oxford he returned to Holland. In 1630 the city of Amsterdam founded a gymnasium, and invited Vossius to the chair of history. Notwithstanding the opposition of the University of Leyden, Vossius accepted the offer, partly because the new office afforded him more leisure, and better opportunity for the education of his children. In 1633 Vossius went to Amsterdam, where he exerted himself to raise the new establishment. Although the successive losses of his children caused him deep and lasting grief, he did not allow these family afflictions to interfere with his official duties or to interrupt his literary activity. He died at Amsterdam in 1649. One day when he was ascending the ladder in his library, the laddar broke, and Vossius was found dead, and buried under his books.

Vossius was a man of extraordinary learning, and had a powerful memory; he boasted that he never forgot anything. He was an humble and devout man, and always ready to serve others. Extremely careful in employing his time, he scarcely ever allowed a friend to stay with him more than a quarter of an hour. He hated nothing more cordially than the theological squabbles and the calumnies with which the scholars of that time assailed one another. His writings, most of which relate to classical antiquity, are very numerous, and some of them necessary to a scholar. They were collected at Amsterdam, 1695-1701, in 6 vols. folio. The following list contains those which are still of great value:—1, 'Aristarchus, sive de Arte Grammatica Libri VII.,' 4to, Amsterdam, 1635, and often reprinted; 2, 'De Historicis Latinis Libri Tres,' 4to, Leyden, 1627; a second edition appeared at Leyden, in 1651. It contains an account of all the writers that ever wrote on historical subjects in the Latin language, down to his own time. 3, 'De Historicis Græcis Libri Tres.' Of this work a most useful edition was published by A. Westermann, 8vo, Leipsig, 1838, which contains many additions and corrections. It gives an account of all the Greek historians down to the taking of Constantinople by the Turks. 4, 'De Veterum Poetarum Temporibus Libri duo qui sant de Poetis Græcis et Latinis,' 4to, Amsterdam, 1652; 5, 'De Logices et Rhetoricæ Naturâ et Constitutione Libri Duo,' 4to, Hagæ, 1658; 6, 'De Philosophorum Sectis Liber,' 4to, Hagæ, 1657.

(Niceron, *Mémoires des Hommes Illustres*, vol. xiii.; Colomesii *Epistolæ G. J. Vossii*, London, 1690.)

VOSSIUS, ISAAC, a son of Gerard Vossius by his second wife, was born at Leyden, in 1618. His education, like that of all his brothers and sisters, was conducted exclusively by his father. After he had completed his studies he travalled for three years through Italy, France, and England, during which time he collected many valuable manuscripts of ancient writers. Queen Christina invited him, in 1648, to Sweden, and Vossius enjoyed for many years her esteem and friendship, and had also the honour of giving her instruction in the Greek language. On his father's death the professorship of history at Amsterdam was offered to him, but he refused it, and although he occasionally visited his native country, yet he spent the greater part of his time in Sweden. Salmasius (Saumaise) was one of the scholars whom Christina drew to her court, and for whom she entertained a very high regard. But Salmasius always treated Vossius in an insolent manner, and when at last the queen was informed that Vossius was going to write against him, she refused to admit him to her presence, whereupon Vossius immediately went back to Holland, in 1658, and never returned to Sweden. In 1663 King Louis XIV. of France sent him a handsome letter, accompanied by a considerable sum of money, partly as an acknowledgment of the great value of his father Gerard Vossius, and partly as an encouragement to Isaac to continue his literary labours. Shortly after this the States of Holland requested Vossius to write a history of the war between England and Holland, and on his refusal, he was deprived of the pension which he had hitherto enjoyed. This appears to have induced him to leave his country, and in 1670 he arrived in England. At Oxford he was made a Doctor of Laws, and in 1673 King Charles II. made him a canon of Windsor, and assigned to him apartments in the castle, where he remained until his death, on the 21st of February, 1688. The splendid library of books and manuscripts which he had collected, and which was considered one of the most complete private collections in Europe, was purchased by the University of Leyden.

Isaac Vossius was almost as learned as his father, but his character was not so blameless. When he attended Divine service in the chapel at Windsor, it is said that he used to read Ovid's 'Amores' and 'Ars Amandi,' instead of his prayer-book, and he was much given to women. He knew all the European languages without being able to speak one of them correctly. He was ignorant in the manners and customs of the ancients, but profoundly ignorant of the world and of the affairs of ordinary life. Although a canon of Windsor, he did not believe in the Divine origin of the Christian religion, and he treated religious matters with contempt, although in all other things he was exceedingly credulous. Charles II. on one occasion said, "This learned divine is a strange man: he will believe anything except the Bible." On his deathbed he refused the Sacrament, and was only prevailed upon to take it by the remark of one of his colleagues, that if he would not do it for the love of God, he ought to do it for the honour of the chapter to which he belonged. His literary merits are great, though his works are not so valuable as those of his father. The following list contains his principal works:—1, 'Periplus Scylacis Caryandensis et Anonymi Peripli Ponti Euxini,' with a Latin translation and notes, 4to, Amsterdam, 1639. 2, 'Justinus Historia Philippica,' with notes, 12mo, Leyden, 1640. 3, 'Ignatii Epistolæ, et Barnabæ Epistola,' with a Latin translation and notes, 4to, Amsterdam, 1646. 4, 'Pomponius Mela, de Situ Orbis,' 4to, Hagæ, 1648; a second edition appeared in 1700, at Francfort. His notes on Mela were criticised against Salmasius. 5, 'Dissertatio de vera Ætate Mundi,' 4to, Hagæ, 1659. In this work he endeavours to establish the chronology of the Septuagint in opposition to that of the Hebrew text. This involved him in various disputes with other divines, especially Horne. 6, 'De Septuaginta Interpretibus, eorumque Translatione et Chronologia, Dissertationes,' 4to, 1663. 7, 'De Sibyllinis aliisque quæ Christi Natalem præcessere Oraculis,' Oxford, 1679. 8, 'Catullus et in eum Isaaci Vossii Observationes,' 4to, London, 1684. 9, 'Variarum Observationum Liber,' 4to, London, 1685. This volume contains a number of dissertations, some of which had been printed separately, but most of them show that he had no critical spirit. 10, 'Observationum ad Pomponium Melam Appendix,' &c., 4to, London, 1686. This appendix is an attack upon Jacob Cronovius, who had censured Vossius's edition of Mela. Isaac also edited the 'Annales Hollandiæ et Zelandiæ, Sexcentorum fere Annorum à Theodorico I usque ad Translatum à Jacobo in Philippum Imperium,' which had been written by his brother Matthias Vossius, who died before the work was completed.

(Niceron, *Mémoires des Hommes Illustres*, vol. iii.; Andreæ *Bibliotheca Belgica*; Wood, *Athenæ Oxonienses*.)

VOUET, SIMON, commonly considered the founder of the French school of painting, was born at Paris in 1590. He was instructed by his father Laurent Vouet, a painter of moderate ability, and distinguished himself at a very early age. Baron de Sancy, French ambassador to the Porte, took Vouet with him to Constantinople in 1611,

Digitized by Google

where he painted from memory, after a single interview, an excellent portrait of the Sultan Achmet I. From Constantinople he went to Venice, and from that place, in 1613, to Rome. In Venice he was attracted by the works of Paul Veronese, but in Rome he forsook for a time his style for that of Carravaggio. His reputation procured him a pension from Louis XIII. while he was in Rome, where he was made president of the Academy of St. Luke; and in 1637 Louis recalled him to Paris, gave him the title of principal painter to the king, and apartments in the Louvre. In Paris he had so much to do that he found occupation for a numerous school of young painters, among whom were Le Brun, Le Sueur, Mignard, Du Fresnoy, Testelin, Patel, the elder Dorigny, and several others. His commissions were so numerous that he was obliged to entrust nearly the entire execution of many of his works to these painters. He painted ceilings, galleries, altarpieces, small religious pieces and other easel pictures, as well as portraits both in oil and in crayons. He painted with great facility in a style peculiar to himself; it was gay, yet feeble in colouring, owing to a want of harmony in the composition of colour: he was mannered likewise in his drawing, especially in the hands and in the heads, which he painted too frequently in profile; he was also deficient in invention and expression, and there is little merit in his compositions. Yet notwithstanding these defects, Vonet greatly improved the French school of painting, and he is allowed by the French historians of art to have done as much for painting as Corneille did for the drama in France. He is however more distinguished for the several excellent painters who were educated by him than for his paintings. He died June 30, 1649. There are about 200 prints after his works, the principal of which are—the chapel and gallery of the Palais Royal; some works in the Hôtel de Bullion; a ceiling in the Hôtel de Bretonvilliers, &c.; also altarpieces in St. Eustache, St. Nicholas des Champs, St. Merry, and in the chapel of St. François de Paule, Place Royale: there is likewise a good picture by him in the Academy of Painting.

VRIES, HANS FREDEMAN DE, a Dutch architectural and perspective painter, born in 1527, at Leeuwarden in Friesland. He was beloved for five years at Leeuwarden, to a painter of Amsterdam, of the name of Gerritez, and designed becoming a glass-painter. He painted some time at Mechlin, and settled for a time at Antwerp, where, in 1549, he was employed with other painters to paint the triumphal arches erected in honour of the entry of Charles V. and his son Philip. He afterwards visited many cities of Germany, in all of which he added to his reputation by his works. De Vries was a complete master of perspective; he published a treatise upon the science, which was afterwards enlarged by Samuel Marolois. His paintings, large and small, are very true; they consist of gardens, exteriors and interiors of buildings; and some of them are embellished with figures by other masters. His drawings and designs were very numerous. There have been published twenty-six books of prints by him, illustrating various styles of architecture, with views of buildings, villas, &c. He was a great admirer of the works of Vitruvius and Serlio, which he studied in the Flemish translations of Peter Koek. Hans had two sons, Paul and Solomon de Vries, who painted in the same style as their father; but though well, with less success. Solomon died in the Hague in 1604, before his father, the date of whose death is not known; the date 1588, in Filkington's 'Dictionary' (ed. 1829), is an error. Paul executed some extensive works at Prague. When he died is also unknown; he was living at Amsterdam in 1604, according to Van Mander; the date therefore of 1593, given in Filkington's 'Dictionary' as the year of his death, is also an error.

Hans de Vries is called sometimes Frisius. There is a portrait of him in Van Mander's work *Leven der Schilders, &c.*

VRIES, MARTIN GERRITZON, a Dutch navigator of the 17th century. In 1643, Van Diemen, at that time governor-general of the Dutch possessions in India, gave him the command of an expedition destined to examine the countries north of Japan, and the west coast of Tartary as far north as the 56th degree of latitude. Vries hoisted his flag on board the Kastricum, and had under him Henrik Cornelissen Schaap, in command of the Breskens. The two vessels sailed from Batavia on the 3rd of February 1643. They were separated on the 26th of May, in a storm off Niphon, and did not meet again till September. During the interim, the Kastricum partially examined the islands in the vicinity of Perouse's Straits, and some were accurately delineated by that navigator and Krusenstern. When Vries rejoined the Breskens, he found the captain and part of the crew had been imprisoned by the Japanese, on a suspicion of their having smuggled some Portuguese priests into the island. The prisoners were soon released till the 24th of July 1644. A brief account of the voyage of Vries was published at Amsterdam in 1646. The venot inserted an abstract of it in his collection of voyages; the instructions given to Vries have been printed in the ninth volume of the 'Philosophical Transactions.' D'Anville corrected a part of the coast-line of the Jesuits' map of China from a large manuscript chart of the track of the Kastricum which came into his hands. A copy of part of this chart on a reduced scale was published in the account of La Perouse's voyage. Both Krusenstern and La Perouse speak with great respect of Vries's talents as a navigator; his astronomical observations are wonderfully accurate, considering the state of instruments in his time. The narrative of his voyage contains some graphic details respecting the appearance of the country he visited and the customs of the inhabitants. Buache, who was not acquainted with the Dutch language, calls Vries by mistake Vries, and the error has been perpetuated in the Voyage of La Perouse. Of the history of Vries, prior and subsequently to his voyage, nothing appears to be known.

W

WAAGEN, GUSTAV FRIEDRICH, an eminent German critic and writer on art, was born at Hamburg in 1794. In that city he prosecuted his early studies in art till they were for a time interrupted by the war with the French. Afterwards he renewed his favourite pursuits with fresh zeal in various places and especially in Munich; but he eventually settled in Berlin, where he some years later received the appointment of Director of the Royal Gallery of Paintings. As an author Dr. Waagen first made himself known by the publication of a pamphlet 'Ueber die in der königlich bair. Sammlung der Akademie der Wissenschaften befindlichen Marmor und andere ägypt. Alterthümer' ('On the royal Bavarian Collection of the Academy of Sciences, particularly as to the Mummies and other Egyptian Antiquities'), Münch., 1820. This was followed by a monograph 'Ueber Hubert und Johann van Eyck,' Breslau, 1822; and by a controversial work 'Hirt als Forscher über die Geschichte der neuern Malerei' ('Hirt as an Inquirer into the History of modern Painting'), Berlin, 1832, in which he defended himself against an attack by Hirt. But his most elaborate work, and that which made him first generally known to English readers, was his 'Kunstwerke und Künstler in England und Frankreich,' 4 vols. Berlin, 1837, of which the first, relating to this country, was translated in 1838 under the title of 'Works of Art and Artists in England.' A new and greatly extended edition of this work, or rather a new work founded upon it, was published in English in 3 vols. 8vo, in 1854, under the title of 'The Treasures of Art in Great Britain; being an Account of the chief Collections of Paintings, Sculptures, Drawings, Illuminated MSS., &c.'; and a fourth and supplemental volume entitled 'Additional Art-Treasures in Great Britain, being an Account of Forty Galleries, visited in 1854 and 1856,' 8vo. 1857; he also re-cast Kugler's 'Handbook of Painting: German, &c., Schools,' 2 vols. 1860. Dr. Waagen has had opportunities afforded him beyond any other person of becoming acquainted with the contents of the Art-Galleries of this country, which have been, both private and public, laid open to him without reserve; and he is familiar with the contents of all the principal picture-galleries on the Continent. He has moreover dedicated his life to the study of pictures, and he is regarded as one of the most accomplished living connoisseurs. His carefully-conducted survey of the picture-galleries of England carries with it therefore necessarily a great amount of authority, and his work is in all respects the most complete and valuable which has been published. As a critic in all technical matters he is eminently learned and judicious; in the higher mental, poetic, or esthetic qualities, though equally conscientious, less trustworthy: his point of view is too exclusively that of the gallery-trained connoisseur. Thus he, in 1857, published a useful little brochure, 'A Walk through the Art-Treasures exhibited in Manchester in 1857, to Observe,' in which these characteristics are strikingly displayed. The only other work of his which requires to be particularly mentioned is his 'Künstlerwerke und Künstler in Deutschland,' 2 vols. Leipzig, 1843-45; but he has also written a sketch of the life of Rubens, and some other minor works. As director of the gallery at Berlin, to Dr. Waagen was assigned the task of newly arranging that noble collection, and this he did upon a chronological plan, by which the progressive development of the art in the various countries was sought to be as far as possible illustrated. This method of arranging pictures, which Dr. Waagen was the first to carry out to its full extent, has since been much canvassed, but it is being followed more or less strictly in the various galleries of the Continent. In England the plan has been adopted with admirable taste and skill by Mr. Cockerell in arranging the works of the old masters in the Art-Treasures Exhibition at Manchester, and where there is so fine a collection of works of a high class the plan is unquestionably capable of producing a pleasing as well as an instructive result. Dr. Waagen was invited during one of his visits to this country, by the Commissioners appointed to inquire into the future management of the National Gallery, to state his opinion respecting the arrangement of the pictures, and it is understood that his views have found acceptance, but the present building quite precludes the practical carrying of them into effect, if even the collection were sufficiently complete to admit of such an arrangement.

WACE, MASTER ROBERT. The name of this early Anglo-Norman poet is variously written in different manuscripts of his poems, and in the ancient writings which make mention of him. The most

Digitized by Google

usual forms are Wace, Gasse, Gace, Guace, Huace, and Huistace, names which appear to be abbreviations of Eustache or Eustace. His Christian name is likewise doubtful, as he never styles himself otherwise than 'Master Wace.' Du Cange supposed it to have been Matthew, and Huet is the first writer who calls him Robert. He was born in the island of Jersey about the year 1112, and received his early education at Caen; he completed his studies, which appear to have been chiefly connected with the clerical profession, during a residence of some time in the territories of the King of France, and he afterwards returned to Caen, where Henry I. usually held his court. In this town he spent the greatest portion of his life; his chief occupation was the composition of metrical romances, so called from their being written in the Romance or vulgar dialect. The 'Roman du Rou,' which he commenced in 1160, was dedicated to Henry II., and was presented to him by Wace in person, who was rewarded with a canonry in the cathedral church of Bayeux; this preferment, according to the ancient capitularies of that church, he held from 1161 to 1171. As he frequently styles himself 'clerc lisant,' reading clerk, it has been supposed that he was attached to the private chapel of Henry II. He complains however, and that somewhat bitterly, that the reward he received from the Dukes of Normandy neither answered his anticipations nor came up to the promises they had made him. He is said to have died in England, about the year 1184.

The principal details in this brief notice of the life of Wace, are given to us by himself in his 'Roman du Rou.'

"Lunge * est la geste des Normanz,	[*Longue.]
Et à metre est grieve ce Romanz.	
Si l'on demande qui ce dist ?	[† Qui dit cela.]
Ki ceste estoire[†] en Romanz mist ;	[† Histoire.]

Del rei Henri segund vos di,	
Nevou Henri, père Henri."	

The rhymed chronicle from which this extract is taken is entitled 'Le Roman du Rou (Rollo) et des Ducs de Normendie,' and is the best known of the writings of Wace ; it is held in high esteem as a monument of the language and as an historical document, which, though incorrect in some of its details and sometimes inexact in its dates, presents a faithful picture of society during that period. It contains the history of the Dukes of Normandy from the first invasion by Rollo down to the eighth year of King Henry I., and not simply, as Hallam states, the narrative of the battle of Hastings and conquest of England by the Normans. The first, or introductory part, is written in lines of eight syllables, and presents us with the history of the first irruption of the Northmen into England and France. The second part or section is written in Alexandrine verse, and relates the principal events which took place in the reign of Rollo ; the third, in the same metre, the history of William Longsword and his son Richard, the first Duke of Normandy of that name ; in the fourth part, which is alone longer than the three preceding, he resumes the eight-syllable measure, and presents us with a sequel of the history of Richard, and that of his successors to the year 1106. The whole poem contains exactly 16,547 verses. He generally follows Dudon and William of Jumieges as his guides in the relation of historical facts, but he adds many interesting and curious details which he reports to have received from hearsay.

His description of the battle of Hastings is given with considerable minuteness of detail, and has been largely drawn upon by succeeding historians. Among the disadvantages under which the English laboured, Wace says that they could not fight on horseback, nor shelter themselves under a buckler with one hand, while with the other they directed their blows against the enemy.

The other chief recognised poem of Wace is 'Le Brut d'Angleterre,' a work which preceded his 'Roman du Rou.' The date of it as ascertained by some lines near the end of the poem is 1155. The principal incidents in it are derived from a Latin translation, by Geoffrey of Monmouth, of a poem composed in the dialect of Lower Brittany. The subject of it is a certain Brutus, who is imagined to have been the great-grandson of Æneas, and who ruled over Great Britain. It contains nearly eighteen hundred lines, in the same metre as those above quoted, and is by some supposed to have been the first work containing the origin of Arthur's round table, his knights, and tournaments. [ARTHUR.]

The next authentic work of Wace is styled 'La Chronique ascendante des Ducs de Normandie :' it commences with Henry II. and goes back to Rollo. It is a short poem of only three hundred and fourteen Alexandrine verses, and is published in the first volume of the 'Mémoires de la Société des Antiquaires de la Normandie,' p. 144. It must have been written later than 1173, as it makes mention of the troubles excited in Normandy during that year by the revolt of the sons of Henry II. against their father.

The other two remaining poems of Wace possess less interest, and are not so generally known. The first of them is entitled 'L'Establissement de la Feste de la Conception, dicte la Feste au Normandes ;' the second, 'La Vie de S. Nicolas,' of which Hickes has published several extracts in his 'Thesaurus Litteraturæ Septentrionalis.'

The above-mentioned works are the only ones which have been preserved, and on their authenticity no doubt exists. Two other poems have been ascribed to him, 'Le Roman du Chevalier au Lion,' and 'Le Roman d'Alexandrie ;' but, though they are undoubtedly productions of the 12th century, they are now generally supposed by the best critics not to belong to Wace.

The manuscripts of his poems are very numerous; there are complete manuscripts of the 'Roman du Rou' both at the Royal Library of Paris, No. 7567, and at the library of the Arsenal; that in the Royal Library is supposed to have been written in the 14th century. The most ancient is in the British Museum, and was probably written in the first years of the 13th century ; it contains however only the fourth part of the 'Romen du Rou.'

There is a valuable essay on the manuscripts of the 'Roman du Rou' by M. de Brequigny, in the fifth volume of his 'Notices des MSS. de la Bibliothèque Royale.'

In 1827, there was published at Rouen a remarkably fine edition of the 'Roman du Rou,' in two octavo volumes, with very valuable notes, by M. Frederic Pluquet, who had devoted several years to the task of collating the text of the various manuscripts in existence. That portion of Pluquet's text which relates to the conquest of England, was re-published, with a translation by Sir A. Malet, in 1860.

The student may consult :—1. Capefigue, 'Essai sur les Invasions Maritimes des Normands dans les Gaules,' 1823; 2. Depping, 'Histoire des Expéditions Maritimes des Normands,' 1826; 3. Wheaton, 'History of the Northmen,' London, 1831. In these two works there are copious and interesting extracts from the 'Roman du Rou;' Depping particularly has very justly appreciated the value of Wace as a poet and an historian. 4. Pluquet, 'Notice sur la Vie et les Ecrits de Robert Wace, suivie de Citations extraites de ses Ouvrages,' Rouen, 1824. 5. Hardy, 'Desc. Catalogue of Materials relating to the Hist. of Great Britain,' ii. 428-37. Roquefort, 'Glossaire de la Langue Romane,' 8vo, 2 vols. 1808, will be found useful in the readers of Wace.

WACHTER, JOHN GEORGE, a distinguished scholar and archæologist, was born at Memmingen in Suabia, in 1673. He studied classical, oriental, and modern languages, and became early known for his learning ; he was also thoroughly acquainted with numismatics. Combining great sagacity and a sound judgment with an extensive stock of knowledge, he was able to produce works, some of which are still among the best of their kind. For some time he was employed in the Museum of Antiquities in Berlin, and was chosen member of the Royal Academy of Sciences of that city. However, the first kings of Prussia, Frederic I. and William I., showed little disposition to promote the arts and sciences, and Wachter left Prussia for Leipzig, where he was appointed first librarian and director of the Museum of Antiquities. He died in 1757. His principal works are :—1, 'Glossarii Germanici Specimen ex Monumentis Ferragine decerptum,' Leipzig, 8vo, 1727: this work was the forerunner of, 2, 'Glossarium Germanicum, continens Origines et Antiquitates totius Linguæ Germanicæ,' Leipzig, 2 vols. fol., 1736-37. This is his principal work, and is still considered a valuable book. Wachter understood all the dialects of the Celtic and Low German languages, and he had also a complete knowledge of the Persian language, which enabled him to establish the meaning and and etymology of a great number of words. He was one of the most distinguished the founders of the school of comparative grammar. 3, 'Archæologia Numaria,' &c., and 'Nova Acta Eruditorum,' and separately, Leipsig, 4to, 1740. The chief object of this work was the explanation of the difficulties connected with the study of numismatics. In the last chapter the author discusses several passages of Pliny ('Hist. Nat.'), concerning coins, and although these passages had already been illustrated by eminent men, such as Father Hardouin and others, the results of Wachter were much more satisfactory. 4, 'Naturæ et Scripturæ Concordia, Commentario de Literis ac Numeris Primævis illustrata et Tabulis Æneis depicta,' Leipzig, 4to, 1752, without the author's name. Besides these and other works on similar subjects, Wachter wrote a great number of valuable memoirs for the 'Miscellanea Berolinensia' (first series) and the 'Nova Acta Eruditorum,' such as 'Tyrannus in Vetere Gemma monetiformi et portentoso emblemate repræsentatus ;' 'De Alphabeto Naturæ et Literarum non Naturalium & Naturalibus Origine Animadversiones ;' 'Ad Dissertationem Eruditam Viri Clarissimi Swentoni de Lingua Etrurim, &c. Annotationculæ,' &c. In his last will Wachter left the manuscript of his great Glossary, which he had enriched with notes and numerous additions, to the library of his native town, Memmingen, where it is still kept. Other valuable linguistic dissertations in manuscript are in the Royal Library at Dresden.

WADDING, LUKE, a Roman Catholic priest of great learning and

Digitized by Google

ability, was born at Waterford, in Ireland, October 16th, 1588. Having been sent abroad in his fifteenth year to complete his education for the ecclesiastical profession, he first spent six months at an Irish seminary belonging to the Jesuits at Lisbon; and then, having joined the order of the Franciscans in 1605, he continued his studies in their convents at Liria, at Lisbon, and at Coimbra. On taking priest's orders he went to Salamanca, and, after residing for some time in that university, was made superintendent of the students and lecturer in divinity. In these offices he acquitted himself so much to the satisfaction of the heads of his order, that, in 1618, when Anthony-à-Trejo, the vicar-general of the Franciscans, was promoted to the bishopric of Carthagena, and was sent as legate from Philip III. of Spain to Pope Paul V. for the settlement of the dispute which divided the Romish Church about the immaculate conception of the Virgin Mary, he took Wadding with him to Rome as chaplain to the embassy, an appointment of distinction and influence, which was coveted by the most eminent members of the order. Wadding did not spend his time in idleness while holding this office: the result of his researches in the libraries not only of Rome, but of Assisi, Perugia, Naples, and many other cities, was the publication at Louvain, in 1624, of a history of the embassy, in a folio volume, entitled 'Legatio Philippi III. et IV., Hispaniæ Regum, ad Sanctissimos DD. Paulum V. et Gregorium XV. et Urbanum VIII., pro defidenda Controversia Conceptionis B. Mariæ Virginis; per illustrissimum Anthonium-à-Trejo.' He had also, before this great work appeared, written three pamphlets on the point in controversy; and although, after the bishop of Cartagena returned to Spain, the whole weight of the negociation, made over nominally to the Spanish ambassador, the duke of Albuquerque, rested upon his shoulders, he found leisure to carry through the press, and to write a learned introduction to, the great Hebrew Concordance of Marius de Calasio, which accordingly appeared at Rome, in 4 vols. folio, in 1621. De Calasio had died at Rome after completing his manuscript, and the funds for printing the work were obtained on the application of Wadding from Paul V. and Peregrino-à-Genua, the general of the Franciscans. A second and superior edition of this Concordance was published at London, in 4 vols. folio, in 1747 and following years, under the care of the Rev. William Romaine. Wadding also prepared an edition of certain writings of St. Francis from manuscripts in the libraries at Rome, which was published at Antwerp in 1623, under the title of 'Sancti Francisci Libri Tres.' He spent the rest of his life at Rome, where, in 1625, he founded the college of St. Isidore, for the education of Irish students of the Franciscan order, and where he was also instrumental in procuring the establishment and endowment of various other institutions for the advancement of theological learning. From 1630 to 1634 he held the appointment of procurator for the Franciscans at Rome; and in 1645 he was appointed vice-commissary of his order, but resigned that dignity in 1648. Of several other works which he edited, the most important is a complete collection of the writings of Duns Scotus, which appeared at Lyon in 12 vols. folio, in 1639, now of great rarity. Of his original works the greatest is his 'Annales Minorum, seu Historia Trium Ordinum à S. Francisco institutorum,' which was printed in 8 vols. folio, the first at Lyon, in 1647 and following years, the eighth at Rome in 1654. There is a second and improved edition of this work, brought out under the care of Joseph Maria Fonseca, in 19 vols. folio, at Rome, 1731-1744; and a Supplement to this was published in one volume, folio, at Rome, in 1806, a posthumous work of a Franciscan named Hyacinthus Sbaralea. Wadding also published at Rome, in 1 vol. folio, in 1650, a valuable bibliographical history of the Franciscans, under the title of 'Scriptores Ordinis Minorum.' To this a supplement was published, at Salamanca, in 1 vol. 4to, in 1728, by Friar Joannes à Divo Antonio. Wadding, after dwelling the office of a cardinal's hat, died at Rome, November 18th, 1657.

WADSTROEM, CARL BERNS, was born at Stockholm, in the year 1746. He entered the Swedish service as an engineer. His acquirements in mineralogy and mechanics procured for him (1767-8) the direction of the works at Trollhetta on the Wener canal. In 1769 he was appointed superintendent of the copper-mines at Atvedaberg. He was subsequently promoted to be chief director of the Royal Assay and Refining Office, and enjoyed the confidence of his king.

While thus steadily advancing in his professional career, Wadstroem found leisure at intervals to visit many parts of Europe. He had contracted a prejudice against commerce and commercial men; his enthusiastic and imaginative turn of mind had adopted many of the views of Raynal and Rousseau; it is also alleged—but the truth of this assertion is uncertain—that the tenets of Swedenborg had made some impression upon Wadstroem. Be this as it may, he conceived, about the beginning of 1787, the idea of a journey into the interior of Africa. The botanist Sparrman and the mineralogist Arrhenius were persuaded to accompany him; and Gustavus III. advanced funds for the expedition. M. de Stiel, Swedish minister at Paris, entered zealously into the project, and mainly through his instrumentality, a free passage in a French ship from Hâvre to Senegal was obtained for the three associates. They sailed in August 1787. After their arrival at Senegal they made several excursions in the vicinity of St. Louis, but finding the obstacles in the way of their advance into the interior insurmountable, they repaired to the English settlement at Sierra Leone, in hopes of finding there the means of their carrying their intentions into effect. Here again they were disappointed, and they left the colony for England towards the close of 1788.

The question of the abolition of the slave-trade was anxiously discussed at the moment of their arrival. Wadstroem had visited London two years earlier, and contracted some acquaintances. As soon as it was known that he and his companion Sparrman were just returned from the coast of Africa, they were invited to give evidence, in the first place, before the privy council, and afterwards before a committee of the House of Commons. Wadstroem now set himself for the first time to study the slave question with earnestness and attention. As might have been anticipated from his turn of mind, the inquiry terminated in his becoming a zealous advocate of the views of Clarkson, Granville Sharpe, and Wilberforce. In the course of the year 1789 he published a pamphlet intended to promote the views of the slave-trade abolitionists, 'Observations on the Slave Trade, and a Description of some part of the Coast of Guinea during a Voyage made in 1787 and 1788, in company with Dr. A. Sparrman and Captain Arrhenius.' From an advertisement at the end, we learn that the author had already given to the world 'Two Views of the Coast of Guinea, with separate Descriptions, embellished with four small prints;' and from an incidental remark in the body of the pamphlet we learn that he contemplated publishing the whole of his voyage. This latter undertaking was never realised.

In his 'Observations on the Slave Trade,' the idea of establishing colonies on the west coast of Africa as a means of civilising the natives and ultimately destroying the slave-trade, appears to have been thrown out for the first time. The hint was acted upon, and to it we are indebted for the British settlement at Sierra Leone (on its present footing), and for that on the island of Bulama. To the discussions which arose in the course of realising the project we are in all probability indebted for 'An Essay on Colonisation, particularly applied to the Western Coast of Africa, with some free Thoughts on Colonisation and Commerce; also brief Descriptions of the Colonies already formed or contemplated in Africa, including those of Sierra Leone and Bulama.' The first part of this work appeared in 1794, the second part early in 1795. The book is not without signs of talent; it bears ample traces of enthusiastic benevolence, but its views are crude in the last degree.

The difficulties of the colonisation of Sierra Leone by a French squadron (1794) appears to have supplied the inducement which carried Wadstroem to Paris in 1795. He memorialised the Directory and the legislative body in that year, urging an agreement between France and England to recognise, in future Sierra Leone and Bulama as neutral settlements that might be made in Africa as neutral territories. In 1796 Wadstroem induced his old friend De Stiel to strengthen his representations by a letter to Lacroix, the minister for foreign affairs. Their united representations were fruitless. The accession of Talleyrand to office, whose predilection for colonising was known, appears to have stimulated Wadstroem to another effort. In 1798 he published a brief sketch of the history of Sierra Leone and Bulama, appended to it De Stiel's letter, and one from Afzelius, a Swedish naturalist, who had been in Sierra Leone at the time the colony was attacked by the French; and also an abstract of his own essay on colonisation, and dedicated the whole to the minister. The only effect of this publication appears to have been the exciting the Chief Consul's curiosity to see Wadstroem's essay. The interruption of all communication with England rendered it impossible to procure his book from this country, and Wadstroem had the gratification (to him it was a gratification, for he admired Bonaparte) of presenting to the French ruler the only copy in France. Wadstroem did not long survive this incident; he died of a pulmonary consumption in the spring of 1799. His only publications are the works mentioned above.

WAEL, or WAAL, CORNE'LIUS DE, a clever battle-painter, born at Antwerp, in 1594. He was the son and pupil of John de Wael, a good figure-painter. Cornelius went with his brother Lucas, a landscape-painter, to Genoa, with the intention of remaining only a short time there, and then of visiting Rome to prosecute his studies. Some of his pieces however being very much admired in Genoa, he was induced to remain there, and he found employment for sixteen years. He painted pictures of various descriptions, but he excelled chiefly in land and sea fights, in which he always introduced a great many very excellent figures of a small size. De Wael at last visited Rome, but found the climate disagree with him, and he returned to Genoa after a year. He was induced however to try a second visit; and after returning a second time to Genoa for a short period, he went a fifth time to Rome, where, says Sopranl, he died a few days after his arrival, in 1662. His best pieces, says Houbraken, were painted for Philip III. of Spain, and for the Duke of Aarschot. Cornelius de Wael etched many of his own designs.

JOHN DE WAEL was born likewise at Antwerp, in 1591. After he had received some instruction from his father, he studied with John Breugel, and painted many pictures in his style. Lucas lived in Italy with his brother, and painted in Genoa many excellent landscapes both in fresco and in oil. Lucas returned to Antwerp about 1660; when he died, Houbraken has not mentioned. Pilkington's 'Dictionary' (ed. 1829) gives 1676 as the date of his death.

WAGENSEIL, JOHN CHRISTOPHER, a learned German, whose reputation however was much greater than his real merit. He was

Digitized by Google

born at Nürnberg, in 1643, and educated in Sweden: he finished his academical studies at Rostock and Greifswald. Gifted with a prodigious memory, he made himself a name by showing what he had learned. In 1667 he accompanied some young German noblemen as tutor, on a tour through Western Europe; the party remained six years abroad. During their stay in Italy Wagenseil was chosen member of the Academies of Literature and Sciences of Padua and Turin, and in Turin he discovered, in the Museum of Antiquities of the Duke of Savoy, the celebrated Table of Isis, which was formerly in possession of the Duke of Mantua, from whose library it unaccountably disappeared in 1630. The faculty of law at Orleans conferred upon him the degree of Doctor in Law; and Colbert, according to the system of bribery then adopted by France with respect to German philosophers and scholars of reputation, gave him a pension of 1500 livres, in order that he might "blow the trumpet of glory for King Louis XIV. in Spain," whither Wagenseil and his pupils were going. In 1667 Wagenseil became professor of history in the University of Altdorf; he also lectured on civil law and Oriental languages: he knew Hebrew well. In 1673 the professorship of Oriental languages at Leyden was offered to him, but he declined it. In 1676 he was appointed chief tutor of the young counts palatine. He died in 1705. His daughter Helena Sibylla, married to Professor Mollern, was renowned for her learning, and was chosen member of the Academy of Padua. Wagenseil published a great number of works and treatises on very different subjects. The principal are:—1, 'Sota: hoc est, Liber Mischnicus de Uxore Adulterii suspecta,' 4to, Altdorf, 1674; a large volume, containing the Hebrew text and a Latin translation of the Mishna and Ghemara: the author's notes are much esteemed by Hebrew scholars. 2, 'Tela Ignea Satanæ: hoc est, Arcani et Horribiles Judaeorum adversus Christum Deum et Christianam Religionem Libri duo,' 2 vols. 4to, Altdorf, 1681. This is a collection of the principal works written by Jews against the Christian faith, with a Latin translation of Wagenseil, who refutes the Jews in his notes. 3, 'De Rei Monetali Veterum Romanorum Dissertatio,' 12mo, Altdorf, 1691. 4, 'Nova Tema Trimestralium super sub Petronii Nomine vulgata Dissertationes H. Valesii et J. C. Wagenseilii,' 8vo, Paris, 1666. 5, 'Exercitationes Varii Argumenti,' 4to, 1719, published after the author's death by Roth-Scholtzius, who has added a biography of Wagenseil. A 'Vita J. C. Wagenseilii,' with a catalogue of his works and an analytical examination of them, was published at Nürnberg, 4to, 1719.

WAGER, SIR CHARLES, ADMIRAL, was born in 1666. He was appointed captain of a fireship in 1692, and was promoted in 1697 to the command of a ship of war. Having been sent out in 1707 to the West Indies as commodore, in May 1708, with only four ships of the line, he attacked seventeen Spanish galleons, which were sailing close along shore from Carthagena to Porto Bello in South America. The battle began at sunset. Soon after dark the Spanish admiral's ship blew up, and the Margo, which was very valuable, was entirely lost. About two in the morning the rear-admiral struck his colours. The vice-admiral escaped in a shattered condition, and some of the other galleons were saved by running them behind a dangerous shoal off Carthagena. More property was lost than was taken, yet Commodore Wager's share of the prize-money was said to have amounted to 100,000*l*. For his conduct in this action he was knighted by Queen Anne, and promoted to the rank of rear-admiral.

Sir Charles Wager afterwards commanded a fleet in the Mediterranean till the peace of Utrecht in 1713, when he was made vice-admiral, and was also elected a member of the House of Commons. In 1726 he was sent with a squadron to the Baltic, to keep the Russians in check and to support the Swedes and Danes, and completely effected the object for which he was sent. In 1731, having been advanced to the rank of admiral, he escorted Don Carlos, the infant of Spain, to Leghorn, and was soon afterwards appointed first lord of the admiralty.

Sir Charles Wager and Lord Sundon had been the representatives of the city of Westminster in the parliament which terminated in 1741, and it was expected that they would have been triumphantly re-elected; but Admiral Vernon and Mr. Edwin were proposed by the opposition, and in the mean time Admiral Wager was summoned by the king to convey him to Hanover. The contest was severe, and the tumult so great on the day of election, that Lord Sundon imprudently got the magistrates to sanction the calling out of a party of soldiers, and while the military surrounded the hustings, the high-bailiff returned Lord Sundon and Sir Charles Wager as duly elected. The return was opposed in the new parliament, the new members were unseated, the magistrates were summoned before the House to be reprimanded, and a resolution was passed that the presence of armed soldiers at an election of members of parliament is a manifest violation of the freedom of election, and an open defiance of the laws and constitution.

In 1742, on the defeat of Sir Robert Walpole's ministry, Sir Charles Wager resigned his office as first lord of the admiralty, which he had held about nine years. He died at his house at Chelsea, June 4, 1743, and was buried in Westminster Abbey. Sir Charles Wager had some reputation for mathematical and physical knowledge, and had devoted a good deal of attention to ship-building. In private life he was much esteemed; his political influence was considerable, and his character as a public man was unblemished.

WAGHORN, LIEUT. THOMAS, R.N., was born in the early part of the year 1800, at Chatham, in Kent. He entered the royal navy as a midshipman, November 10, 1812. Before he had quite completed his sixteenth year he had passed in navigation for a lieutenant before the Royal Naval College, at Portsmouth. He was paid off in 1817, and after serving some time as a mate in a free trader to Calcutta, was appointed in 1819 to the Bengal Pilot Service, in which he remained till 1826. He then volunteered for the war in Arracan, and was appointed to the command of the Matchless, East India Company's cutter, and of a division of the gunboats connected with the flotilla and army. He was employed in much service by land as well as by sea, was in five engagements, and was once wounded in the right thigh. He returned to Calcutta in 1827, and soon afterward entered into communication with the government authorities there with respect to a project which he had conceived of communication by steamers between Great Britain and the East Indies. Having returned to England with recommendations from some of the chief members of the Bengal government, he immediately began to advocate in London, Liverpool, Glasgow, and other large towns, as he had previously done at Madras, Mauritius, and the Cape of Good Hope, the great project which he had in contemplation, and to the accomplishment of which he applied the whole force of his energetic mind and will. Unfortunately the chief authorities of the post-office, as well as nearly the whole of the East India directors, were adverse to his project. But in October 1829, Lord Ellenborough, president of the Board of Control, and Mr. Loch, chairman of the Court of Directors, engaged him to proceed through Egypt to Hindustan with despatches for Sir John Malcolm, governor of Bombay, and he was directed to join the Enterprise steamer at Suez on the 6th of December. The Enterprise however having broken her machinery on the voyage from Calcutta to Suez, Waghorn was not there, and Mr. Hayes, rather than return to England with the despatches, sailed down the Red Sea in an open boat, without chart or compass, directing his course by the sun and stars. In six days and a half he reached Jiddah, on the coast of Arabia, a distance of 628 miles, whence he proceeded by ship to Bombay. This journey convinced him of the advantages of the line of communication through Egypt, and by Suez down the Red Sea to Bombay. With unabated energy and perseverance, supported only by the Bombay Steam Committee, he was enabled to complete the overland route in three entire years before it was taken up by the British government. He accomplished the building of the halting-places and the establishment of the hotels on the desert between Cairo and Suez. He supplied carriages, vans, and other necessary means of conveyance, and also placed small steamers on the canal of Alexandria and on the Nile, as well as suitable steamers on the Red Sea. From 1831 to 1834 the overland mails to and from the East Indies were worked by himself. In 1832 he brought under the notice of the Pasha of Egypt the advantages which would result to that country from the formation of a railway between Cairo and Suez, but that improvement of the overland route has not yet been undertaken. He attained the naval rank of lieutenant March 23, 1842, after which he retired on half-pay. In the winter of 1847 Lieutenant Waghorn effected a saving of thirteen days by performing the journey by the way of Trieste, instead of through France, and he also explored other routes, by Genoa, and through the Papal States, taking steamer at Ancona. The prosecution of the Trieste line in 1846 involved Lieutenant Waghorn in pecuniary engagements, from which the sacrifice of his entire property was insufficient to release him. A petition of time before his death a pension was granted him by the British government, of which he lived to receive only the first quarterly payment. He died January 7, 1850, at Pentonville, London, in the forty-ninth year of his age, worn out by a life of anxious labour and exposure to extremes of weather and climate. A small pension was granted by the British government to his widow, to which a small addition was made by the East India Company from a fund at their disposal.

WAGNER, RICHARD, a German dramatic composer of the present day, was born at Leipzig in 1813. He had attained an eminent position in his profession at Berlin; but, having been involved in the political disturbances which originated in the year 1848, he was under the necessity of leaving Prussia, and has subsequently resided chiefly at Zurich. He passed the season of 1855 in London, having been engaged as conductor of the orchestra of the Philharmonic Society. Herr Wagner is chiefly known as the author of several German operas, especially 'Tannhauser' and 'Lochengrin,' both of which have acquired considerable popularity in Germany, though they are unknown to the English public, only a few fragments of his compositions having ever been performed in this country. In Germany, his character as an artist is a disputed question. By some critics he is extolled as a great musical reformer, who has thrown aside the established forms and conventionalities of the art, and laid the foundation of an entirely new style, founded on true æsthetic principles. By others, however—and they appear to form the majority—his music is characterised as obscure and fantastic, destitute of melody and symmetry of form, and full of crude and discordant combinations. He has himself expounded, in some literary essays, the principles which his compositions are designed to illustrate, but these writings are tinged with the mysticism which prevails in German philosophy and which often renders it so incomprehensible to the English in-

Digitized by Google

tallest. Wagner himself designates his music as "the Music of the Future:" whether it will really be adopted by "the Future," or whether it will pass away, among other dreams of misdirected genius, time only can show.

WAHHÁB, 'ABDU-L-, a Mohammedan sheikh, who flourished in the 12th century of the Hejira, the 18th century of the Christian era, and the founder of the WAHABEES, or WAHHÁBÍS, a Mohammedan sect in Arabia. The origin of this sect is intimately connected with the following circumstances. When Sultan Selîm I. had conquered Egypt and deposed the last kelîf of Cairo, Al-muta-wakkel in A.H. 922 (A.D. 1517), he was acknowledged as successor of the kelîfs by Berkât, the grand sherîf of Mecca, who presented him with the keye of the Ka'bah. From this time the sultans of the Osmanlîs were the protectors of the Mohammedan feith, though only recognised as such by the Sunnites; they were the guardians of the holy cities, Mecca and Medîna; and they had the privilege and the duty of protecting the numerous caravans of hâjis, or pilgrims, which annually travel to Mecca. A Turkish pasha resided at Jidda, and sometimes also at Mocha, and while the fertile provinces of Hejaz and Yemen in Western Arabia seemed to obey the Sultan, the pashas of Baghdâd and Basrah made frequent attempts to establish the Turkish authority in the province of El-Hassa in Eastern Arabia. The Mohammedan religion had generally departed from its primitive purity, and was particularly corrupted among the Turks. The Mohammedan priesthood introduced many of their religion, which were rather calculated to please the senses, and which found favour among people who have always loved to follow the bent of their imagination. Mohammed gradually received honours like God himself; virtuous men became saints, and the miracles they were said to have performed were eagerly believed by the people. In many sustere rules of the Korân were forgotten or left to the extravagances "of a few derwishes and fakirs;" and the places of worship were adorned by the princes and the rich with the arts and luxuries of the East, while the poorer Mohammedans indulged their passion for religious buildings by erecting a rude tomb to some unknown saint, surmounted by a cupola of painted brick-work. To this we must add that the Korân ceased to be the sole source of religious knowledge, and that traditions concerning Mohammed were considered by his disciples as pure and trustworthy as the Korân itself. Although the Arabs had deviated from the rule of the Korân, there was a striking difference between them and the Turks. The Turks used opium and wine; not satisfied with polygamy, they indulged in various licentious practices, which are strictly prohibited by the Korân, and even that once holy hâjis of the Turkish caravans had polluted the sacred cities with their scandalous conduct. The caravans especially, those congregations of pious men assembled for the purpose of performing one of the most sacred duties of their faith, presented a revolting aspect to the simple and uncorrupted believers among the Bedouins of the desert. Their leaders gave full licence to debauchery, and although it was generally their riches which tempted the Beduins, and excited them to predatory attacks, it often happened that the Son of the Desert unsheathed his sword, indignant at the pride and vices of men who, from the moment they reached Mecca, proudly assumed the holy title of 'hâjî.'

Such was the state of the Islâm, when, in the beginning of the last century, a Mohammedan sheikh conceived the project of reforming the religion of Mohammed, and restoring it to its primitive purity.

This sheikh was 'ABDU-L-WAHHAB ('the servant of Him who gives (us) every thing'), who, according to Burckhardt, was born at El-Hauta, a village five or six days' journey south of Der'aiyeh, the capital of the province of Nejd, on the road from this town to the district called Wâdî Sowâder. The life of 'Abdu-l-Wahhâb, in the 'Universal Biographical Dictionary,' his birth-place is called 'Al-Aynah, in Nejd; and in the 'Annals of the Turkish Empire,' by Izî, Constantinople and Skutari, A.H. 1198 (A.D. 1784), p. 207, as *ibne*, it is called Aiyineh, which seems to be El-Aeyneh, near Der'aiyeh. Scott Waring calls it Ujunu, a bad orthography for Ajsna. 'Abu-l-Wahhâb was born at the beginning of the 12th century of the Hejira, which corresponds to the end of the 17th century of our era. His father was the sheikh or chief of the Beni Wahhâb, a branch of the great tribe of Temîm, which occupies a considerable part of Nejd. 'Abdu-l-Wahhâb received his education in the schools of Basrah, where he studied divinity. He made the usual pilgrimages to Mecca and Medîna, and he lived several years at Damascus, where he had frequent disputations with the divines on the Islâm, but as he despised all formal in the abolition of abuses, his doctrine was considered as schismatic, and being exposed to persecutions, he fled to Mosul. After some time he returned to Arabia, but the doctrines which he preached to the natives, and his violent attacks on Turkish tyranny and vice, became so many causes for new persecutions, and he led a wandering life till he settled at Der'aiyeh, the residence of the Sheikh MOHAMMED IBN SA'ÛD. This intelligent chief listened to the words of the reformer. He became his disciple; he married his daughter; and soon drew his sword to propagate the new doctrine among the tribes of Arabia. Mohammed Ibn Sa'ûd thus laid the foundations of a powerful empire on theocratical principles, of which his descendants remained masters for nearly a century.

When Sa'ûd, the grandson of Mohammed Ibn Sa'ûd, conquered Mecca, he ordered a kind of confession of faith to be published, the substance of which is as follows:—

'Abdu-l-Wahhâb's doctrine teaches the salvation of mankind. It is divided into three parts: I., the knowledge of God; II., the knowledge of religion; III., the knowledge of the prophet. In the first part, God, it is said, is one Almighty, and we acquire the knowledge of him by adoring him. The second part, knowledge of religion, is threefold, and contains—1, The Islâm, or resignation to the will of God; 2, faith; 3, good works. The Islâm contains five things: 1, The belief that there le only one God, and that Mohammed is his prophet; 2, the five daily prayers; 3, alms, one-fifth of the annual income; 4, fasts during the month of Ramazan; 5, the pilgrimage to Mecca. The faith contains six things, viz.:—1, The belief in God; 2, in his angels; 3, in his Holy Scripture; 4, in his prophets; 5, in his divine and perfect qualities; 6, in the day of judgment. Good works are only the consequence of the rule that we should adore God as if he were present to our eyes; and though we cannot see him, we must know that he sees us. The knowledge of the prophet, which is the most important part of Wahhâbism, is based on very positive principles. Mohammed, the prophet, was a mortal, like all other men, and he preached for all the nations of the world, and not for one only, the Arabs; no religion is perfect and true in all its parts except his, and after him no other prophet will come; Moses and Jesus were virtuous men, though inferior to Mohammed, notwithstanding he was not of divine nature. Those who do not fulfil their religious duties are to be severely punished. The reformed religion shall be propagated with the sword, and all those who refuse to adopt it are to be exterminated.

'Abdu-l-Wahhâb not only forbade the adoration of Mohammed and of saints, but he also ordered their splendid tombs to be destroyed, and the declared tradition to be an impure source. He made several other prohibitions concerning society and religious abuses, such as the habit of using wine, opium, and tobacco, the use of the rosary for prayers, and he preached strongly against those unnatural practices which were and are still so frequent among the Turks.

The doctrine of 'Abdu-l-Wahhâb was no new religion: it was Mohammedanism reduced to a pure deism, and so little did it deviate from the Korân, that even to the present day many theologians of Syria and Egypt do not venture to say that it is schismatic. Yet Abdu-l-Wahhâb maintained that there had never been any man directly inspired by God, and that there was no scripture or book whatsoever which was entitled to be called divine. Hence it follows that according to 'Abdu-l-Wahhâb there is no revealed religion; and if he calls the Mohammedan a divine religion, it is not because he believed that it had been transmitted directly from God to man, but merely on the ground of its perfection.

The reformed Mohammedanism made rapid progress, especially among the nomadic Arabs or Bedouins, who had never adored Mohammed as a divine person, nor viewed the Korân as a divine book, although they considered themselves as bad as orthodox Mohammedans as any of the other nations which have adopted the Islâm.

The inhabitants of the towns were less inclined to adopt Wahhâbism, but Mohammed Ibn Sa'ûd nevertheless succeeded in conquering the greater part of Nejd, of which he was the temporal chief, while 'Abdu-l-Wahhâb was the spiritual chief. The system of government established by these two men was strictly conformable to the political prescriptions of the Korân, and very like that of the first kalifs. The temporal chief, or sultan, lay in the hands of the temporal chief, but his authority was confined to the direction of important affairs; the governors of the provinces and the under-governors were kept in strict obedience to the orders of the prince, but their authority over the Arabs was not very great. The ulema of the capital, Der'aiyeh, who generally belonged to the clan or family of Sa'ûd, formed a council or ministry for religious and legislative affairs, and in time of war the governors used to assemble in Der'aiyeh for the purpose of concerting the plan of the campaign. Trade and agriculture were well protected. The revenues of the Wahhâbee states were composed of:—1, One-fifth of the booty taken from heretics; the remaining four-fifths were for the soldiers. 2, the tribute, called 'alms' in the Korân: it was a certain part of the property, which varied according to the nature of the property; for fields watered by rain or rivers it was one-tenth of the yearly produce; for fields watered artificially, one-twentieth only; merchants paid one and a half per cent. of their capital. The Beduins, who had always been tax-free, disliked these 'alms' very much, but they were indemnified by the considerable booty which they gained from the chief or prince's own estates, and from the plunder of rebellious towns. The punishment for a first rebellion was a general plunder, one-fifth of which belonged to the fiscus; in case of a second rebellion, all the grounds belonging to the town were confiscated and became the property of the reigning chief; and as such rebellions were very frequent, the chief acquired immense estates. The greater part of them were afterwards confiscated by Mehemet Ali, the pasha of Egypt. Except a few hundred men who formed the prince's life-guard at Der'aiyeh, the Wahhâbîs had no standing army, but assembled when the prince designed some expedition. Two or three great expeditions were made every year.

The name of the Wahhâbîs soon became known in the Turkish provinces adjacent to Arabia. The Turkish government was not aware that this sect had as much warlike and religious energy as the Arabs under the first kalifs, but it is quite unaccountable to us

Digitized by Google

Rhuseau, the French consul-general at Baghdad did, of looking at the memorable events in Arabia "with a stupid eye, as usual." As early as A.H. 1161 and 1162 (A.D. 1748 and 1749) Ahmed El-Hájí, pasha of Baghdad, and formerly grand-vizir, displayed great activity against the adherents of Mohammed Ibn 'Abdu-l-Wahhábi, whose "impious doctrine sapped the fundamental principles of Islám, and who set himself up as the head of a new religion." (Izl, cited above: 'Universal Biographical Dictionary,' Life of Ahmed Pasha El-Hájí.) The simple fact that, if Wahhábism had become predominant, the sultan would have ceased to be the 'visible' chief of the believers, leads us to conclude that the diwan had never looked with a stupid eye on the religious reform in Arabia.

Mohammed Ibn Sa'úd died in A.H. 1179 (A.D. 1765), and 'Abdu-l-Wahhábi died on the 29th of Shawwál A.H. 1206 (14th of June A.D. 1787).

The successor of Mohammed Ibn Sa'úd was his son, 'Abdu-l-Azíz, under whom the power of the Wahhábis was extended over the greater part of Arabia, and became the terror of Turkey. As early as 1792-93 the Wahhábis made a successful campaign against Ghálieb, the grand sheikh of Mecca.

The provinces of Basrah and Baghdad, adjacent to Nejd, had suffered from the incursions of the Wahhábis from the time of their coming into political power. In 1797 Soliman, pasha of Baghdad, made a fruitless attempt to attack them in the province of El-Hassa; his troops were obliged to retreat, the victorious Arabs overran the neighbourhood of Basrah, and took the holy town of Imám Hussein, where they destroyed the famous temple and robbed it of the immense treasures which had been deposited there by the pious generosity of the sultans of the Osmanlis and the shahs of Persia. Another Turkish army, reinforced by a strong body of Arabs from Irák Arabi, entered Nejd in 1801, and was only five or six journeys from Dar'aiyeh, when Thoeni, the sheikh of the Beni Montesh and commander of the Arab auxiliaries of the Turks, was murdered by a fanatical Wahhábi. It is said that the other chiefs of the Turks were bribed by 'Abdu-l-Azíz, for they retreated suddenly, but were nevertheless attacked on their march, and the whole Turkish army was destroyed. In the same year, 1801, 'Abdu-l-Azíz, at the head of more than 100,000 men, made a fresh expedition against Mecca. Othmán-el-Medhayfah, the brother of Ghálieb, the sheikh of Mecca, joined the Wahhábis, and having been put at the head of a considerable body by 'Abdu-l-Azíz, he took Tayef, a large town east of Mecca, and Konfodah, a port on the Red Sea. The rest of Hejáz was conquered by 'Abdu-l-Azíz, who took Mecca early in 1803, after an obstinate siege. He would have taken Mecca earlier, but for the arrival of the great caravan of Damascus, commanded by the pasha of Damascus, which was allowed to enter the Mecca for three days, after which the Wahhábis entered the town without resistance. They killed many sheikhs and other believers who refused to adopt Wahhábism; they robbed the splendid tombs of the Mohammedan saints who were interred there; and their fanatical zeal did not even spare the famous mosque, which they robbed of the immense treasures and costly furniture to which each Mohammedan prince of Europe, Asia, and Africa had contributed his share. The fall of Mecca was followed by that of Medina in 1804, and the tomb of Mohammed was robbed and destroyed. 'Abdu-l-Mayn, a brother of Ghálieb, was appointed governor of Mecca, but he soon lost his post; Ghálieb, who had fled to Jidda, having bribed the chief of the Wahhábis, and succeeded in being appointed governor on promising to adopt Wahhábism, which he did. Previously to the fall of Medina, and as early as 1803, 'Abdu-l-Azíz was murdered by a fanatical Shíite, a native of Persia; his successor was his eldest son, Sa'úd, whose complete name was Sa'úd Ibn 'Abdu-l-Azíz. Ghálieb, anxious to obtain his former dignity and independence, intrigued against Sa'úd, in the hope of kindling a general war between Turkey and Arabia, from which he might derive advantage, he persuaded Sa'úd to forbid the khotbah, or public prayers, to be said in the name of the sultan. Sa'úd gave the order, and from that moment the sultan, in the eyes of the people, ceased to be the protector of the holy towns and the visible chief of their religion.

If during the course of the Thirty Years' War a Protestant army had taken possession of Rome and put a married priest on the seat of St. Peter, the scandal and confusion produced by such an event among the Roman Catholics could not have been greater than the horror and general consternation which spread throughout the East when the people heard that the tomb of the prophet had been despoiled, and that the first temple in the Mohammedan world was in the hands of heretics. The pilgrimages were stopped: from 1803 to 1809 no great caravan ventured to cross Arabia; and from the Atlantic to the banks of the Ganges and the frontiers of China every pious Mohammedan felt deeply grieved at the thought that henceforth he would be prevented from performing a duty which he considered most sacred. Persia was unable to give aid, and the diwan, absorbed by the danger to Turkey from the wars in Europe, was compelled to resignation.

In the time that followed the conquest of Mecca and Medina, Sa'úd, the greatest chief of the Wahhábis, established his authority in the remainder of Arabia, except Hadhramaut and Omán, where he found a formidable adversary in the Imám of Maskat. Sa'úd conquered the whole province of El-Hassa, the islands of Bahrein, and several Arabic towns on the coast of Persia. The Gulf of Persia was then infested by Arab pirates, who, after Sa'úd had taken possession of the greater part of the coasts, were either Wahhábis or at least made common cause with them. The British commerce in those seas was greatly injured by these pirates, who were severely chastised by the British forces under Captain Wainwright, the commander of the fleet, and Colonel (afterwards General) Sir Lionel Smith. The British troops acted in concert with the forces of the Imám of Maskat, and the war was finished early in 1809.

The very existence of Turkey being menaced by the Wahhábis, who overran Syria and concluded an alliance with Yúsuf, the rebellious pasha of Baghdad, the diwan at last found a man who was able to subject those terrible enemies. This man was Mehemet Alí, the late pasha of Egypt.

Mehemet Alí made his first preparations in 1809. To save his army from marching round the northern gulfs of the Red Sea, he ordered the timber for a flotilla of twenty-eight vessels to be got ready at Bulák, the port of Cairo, whence it was carried on camels to Suez, where the ships were constructed. The commander of the expedition was Túrún-Bey, the second son of Mehemet Alí, then eighteen years old, who was seconded by Ahmed Agha, surnamed Napoleon or Bonaparte. Túrún-Bey entered Arabia in 1811; in 1812 he was beaten by the Wahhábis near Medina, but he took this town in the course of the same year, a conquest which was mainly due to the impetuous courage of Thomas Keith, a Scotch renegade, known as Ibrahim Agha, who took the outworks of Medina by storm. Mecca was taken in 1813, and Ghálieb, in spite of his withstanding he had favoured the Egyptian invasion, was made prisoner, and sent to Salonica in European Turkey, where he died in 1816.

In 1814 Sa'úd died, and was succeeded by his eldest son 'Abdullah. The power of Sa'úd was the foundation of the ruin of the Wahhábis. In 1815 the Egyptians suffered a defeat at Zohrán, but they obtained a signal victory at Bisel. Túrún-Bey paid six dollars for every head of a Wahhábi; and having obtained 6000 heads, he ordered them to be piled up in a pyramid. Peace was concluded during the course of the following year (1815) on unfavourable conditions to 'Abdullah, who sent an ambassador to Cairo named 'Abdu-l-Aziz, a learned sheikh, whose further negociations were interrupted by the sudden outbreak of fresh hostilities.

The commander of the new Egyptian expedition was the celebrated Ibrahim Pasha, the son of Mehemet Alí, who entered Arabia in 1816. After an obstinate resistance, the Wahhábis retreated to Der'aiyeh in 1818, where 'Abdullah was besieged by Ibrahim. The siege was long, but it was carried on by Ibrahim with skill, boldness, and admirable perseverance till the month of September 1818, when 'Abdullah surrendered. He and several of his family were sent to Constantinople, and after having been promenaded through the streets for three days they were beheaded, and their bodies were exposed to the outrages of the populace. The greater part of the territories conquered by the Wahhábis fell under the authority of Mehemet Alí. Thus the power of the Wahhábis was broken, and though they were not exterminated, they have not since been able to make head against the Egyptian power.

WAILLY, NOEL-FRANÇOIS DE, one of the most esteemed of French grammarians, was the son of a municipal officer at Amiens, where he was born on the 31st of July 1724. At first he was intended and educated for the priesthood, but he was withdrawn from that vocation by his attachment to general literature, and a more than common aptitude for the study of living languages. In order to pursue this study he went to Paris, where he obtained a preceptor's place in the school conducted by M. de Prétot, one of the best educators of the day, who became his patron. In 1754 he published his 'Principes généraux et particuliers de la Langue Française,' which was at once received as an original work of real value. It raised the author to an eminent position among grammarians, and introduced him to the friendship of Beauzée, Duclos, the Abbé Girard, and Marmontel, who remained his intimate friends and colleagues during his lifetime, and was repeatedly revised by the author. M. de Wailly had dedicated his Grammaire to the University of Paris, by whom it was considered as one of the best elementary treatises, and its use urgently recommended to public schools in preference to those of Restaut and Olivet. Some critics however have alleged that it still exhibits serious deficiencies and peremptory decisions peculiar to the author. Restaut, in his grammar, had not treated the syntax as a distinct subject, a separate division; and, like all his predecessors, had adopted the Latin form of declension with the nouns, which De Wailly felt to be irrelevant, as the article alone clearly pointed out the distinction of cases. He likewise greatly simplified the theory of the article and pronouns. His grammatical reforms were also extended to the French verbs; but in this case his innovations were not so favourably received by the learned. His opinions on the subject of orthographical reform were considered to be impossible in practice, however well founded in themselves. It was somewhat on the phonetic principle, which has been, with similar ill success, endeavoured to be introduced into the English language. His other works were, 'Principes de la Langue Latine,' of which the ninth edition was published in 1773; 'De l'Orthographe, au Moyens simples et raisonnés de diminuer les imperfections de nôtre orthographe;' 'Introduction à la

Digitized by Google

Syntaxe Latine, traduit de l'Anglais,' published in 1773; the 'Dictionnaire portatif de la Langue Française' 2 vols., 1774; the 'Dictionnaire des Rimes;' the 'Histoire choisie du Nouveau Testament;' but especially his 'Nouveau Vocabulaire Français, ou Abrégé du Dictionnaire de l'Académie,' deserve mention: this last work, in which he was assisted by his son, and to which his grandson afterwards contributed, went through thirteen editions. He also revised the standard translations of Persius, Quintilian, Sallust, Cicero, Cæsar, and Eutropius. He was a member of the Institute from its foundation, and was also a member of several academies. He married in 1766; he had several children, and lived in the midst of his family in comparative tranquillity, through the Revolution, the Reign of Terror, and the first years of the Consulate. He died at Paris, April 7, 1801.

ETIENNE-AUGUSTIN DE WAILLY, his son, was born on the 1st of November, 1770, and died May 15, 1821. Besides the assistance he rendered his father in compiling lexicographical works, he produced an edition of the works of Jean-Baptiste Rousseau, the lyric poet, with notes, and a translation in verse of the first three books of Horace's Odes. In this translation he has adopted the metre of Rousseau, which he greatly admired. From 1802 to 1810 he was one of the editors of the 'Mercure de France.' Shortly before his death he was proposed for the Académie Française, with every likelihood of his being elected.

CHARLES DE WAILLY (born November 1729, died November 1798), the principal founder of the Society of the 'Amis des Arts,' and distinguished in his day as an architect, was a member of the same family.

WAKE, WILLIAM, D.D., a distinguished English prelate, was born in 1657 at Blandford in Dorsetshire, where his father, William Wake, Esq., the descendant of an old family, possessed considerable property. In 1672 he was admitted a student of Christchurch, Oxford; and having taken his degree of B.A. in 1676, and that of M.A. in 1679, he resolved to enter the church, although his father is said to have designed him for a commercial life. Having accordingly taken holy orders, he went in 1682 to Paris as chaplain with Viscount Preston, despatched as envoy extraordinary to that court. Returning home with his lordship in 1685, he was soon after elected preacher to Gray's Inn. His first publication appears to have been 'A Preparative for Death, being a Letter to a young Gentlewoman in France,' a fourth edition of which appeared in 1688. In 1686 he published a tract in 4to, entitled 'Exposition of the Doctrine of the Church of England,' in answer to Bossuet's recently-published 'Exposition of the Roman Catholic Faith,' which Wake charged the author with having found himself compelled by the objections of the doctors of the Sorbonne to alter materially from the form in which he had originally written it, and in which it had not only been extensively circulated in manuscript, but actually printed. This, with his ceremonial relative to the 'Test Catechism,' gave rise to a long controversy, in the course of which Wake published 'A Defence' of his Exposition in 1686 and 'A Second Defence,' in two parts, in 1688. He also took an active part in the general controversy between the Romish and Protestant churches, which was carried on in England through the press in 1687 and 1688. In October of the latter year he married Miss Ethelred Hovel, daughter of Sir William Hovel, of Illington in Norfolk. Immediately after the Revolution he was appointed deputy-clerk of the closet to King William; and in June 1689 he was preferred to a canonry of Christchurch, Oxford. He now either accumulated his degrees in divinity, or, according to another account, was created D.D. In 1693 he obtained the rectory of St. James's, Westminster; and the same year he published one of his principal works, 'An English Version of the Genuine Epistles of the Apostolic Fathers, with a Preliminary Discourse concerning the use of those Fathers.' He greatly improved this work in a second edition of it, which he brought out in 1710; and it was afterwards twice reprinted during his lifetime. Another work subject in the public discussion of which he engaged was that of the powers of the Convocation; in the controversy respecting which he published in 1697 an octavo tract entitled 'The Authority of Christian Princes over their Ecclesiastical Synods asserted;' in 1698, 'An Appeal to all the true Members of the Church of England in behalf of the King's Ecclesiastical Supremecy;' and finally, in 1703, a folio volume entitled 'The State of the Church and Clergy of England, in their Councils, Synods, Convocations, Conventions, and other public assemblies, historically deduced from the Conversion of the Saxons to the present times.' To this elaborate work no answer was attempted by Atterbury or any of his fellow-disputants on the other side. In 1701 Wake had been made dean of Exeter, and in 1705 he was raised to the bishopric of Lincoln. In the earlier years of his episcopacy he continued to adhere to what was called the Low Church party; but he afterwards became more conservative at least, and if he did not actually change his principles and go over to the other side, he was thrown in opposition to those who were now the leaders of the party with which he had originally acted. In January 1716, on the death of Archbishop Tenison, he was translated to Canterbury; and in 1718 he exerted himself in the House of Lords to prevent the repeal of the Schism and Occasional Conformity Bill, and the year following, more successfully, against the attempt to repeal the Test and Corporation Acts. About the same time his zeal broke out in a Latin letter directed against Bishop Hoadly and his partisans, which he addressed to the superintendent of Zürich, and which was immediately published in that city. It exposed him to some severe strictures. In 1721 also he got into a controversy with Whiston, whom he had formerly endeavoured to protect, by the part he took in support of the bill for the more effectual suppression of blasphemy and profaneness, brought into the House of Lords by the Earl of Nottingham, which was understood to be chiefly levelled against Arianism, but did not pass. The most remarkable affair however in which Archbishop Wake was involved was the negociation which he entered into with M. Dupin and some of the heads of the Jansenist party in France, for the bringing about of a union between the church of that country and the Church of England. The correspondence upon this subject, which commenced on the part of Dupin in 1718, is most fully given in an appendix to Maclaine's translation of Mosheim's 'Ecclesiastical History,' published in 1768. The part which Wake took subjected him long afterwards, while the facts were but imperfectly known, to much obloquy, especially from Archdeacon Blackburne, in 'The Confessional,' published in 1766; but it does not appear that he really made any concession of principle to his Romish correspondents, or indeed went further than merely to express his willingness to assist in bringing about the proposed union if it could be managed without any such concession. The last years of Archbishop Wake's life were clouded by great infirmity; and he died at Lambeth January 24th, 1737. He bequeathed his library and his collection of coins, together valued at 10,000*l.*, to Christchurch College, Oxford. A collection of his 'Sermons and Charges,' in 8 vols. 8vo, was published after his death. By his wife, who died in 1731, he left six daughters, who all made good marriages. He was succeeded in the primacy by Dr. John Potter.

WAKEFIELD, EDWARD GIBBON, is a son of Edward Wakefield, who died May 18, 1854, aged 86, and who published 'An Account of Ireland, Statistical and Political,' 2 vols. 4to, 1812. This bulky compilation was chiefly intended to be an expositon of the industrial resources of Ireland, and much of it is consequently occupied with observations on matters connected with political economy. Edward Gibbon Wakefield seems to have become interested in the speculations which engaged so much of his father's attention, and in 1833 published 'England and America, a Comparison of the Social and Political State of both Nations,' 2 vols. 8vo. This work was distinguished not only by the popular boldness of the author's opinions on questions relating to the government and administration of Great Britain and the United States, but by many original and correct views of the social conditions and peculiarities of the respective countries. The greatest part of the second volume is occupied with a treatise on Colonisation, in which the author shows very distinctly what have been the causes of failure and success in modern colonies, and lays down the principles which ought to be observed in their foundation and establishment. In this work he restricts the meaning of the words colonisation and colony to "the removal of people from an old to a new country, and the settlement of people on the waste land of the new country." The author was probably connected, though not ostensibly, with the South Australian Land Company, instituted in 1832, the object of which was to found a colony on the shores of Spencer's Gulf. Lord Goderich, then minister for the colonies, refused to grant a charter, and the company was dissolved. The work of E. G. Wakefield, 'A View of the Art of Colonisation,' published in the following year, attracted much attention, but it seems not to have led to any result till 1837, when he became the founder of the New Zealand Association, which was also refused a charter by the colonial office. The Association however, with permission of the government, resolved to purchase New Zealand and form settlements in New Zealand in the manner which had been previously sanctioned by the crown. With this view a number of persons were collected who were disposed to go out as settlers under the direction of an agent, who was instructed to acquire from the natives by the usual method of purchase, but if possible upon a far larger scale than had ever been necessary for purposes of cultivation and trading by individuals.

The agent appointed by the association was Colonel William Wakefield, a brother of E. G. Wakefield, who was authorised to select the most eligible site for a new colony, and make preparations for the reception and settlement of the colonists. Colonel Wakefield, accompanied by a few passengers, including Edward Jerningham Wakefield, a son of E. G. Wakefield, set sail from Plymouth May 12, 1839, in the Troy, a vessel of 300 tons, which entered Cook's Straits on the 16th of August. Colonel Wakefield selected the vicinity of Port Nicholson, at the south end of the North Island, or New Ulster, as a suitable locality for a colony, and there he purchased land, and prepared for the reception of the emigrants, of whom the first shipment arrived early in 1840. The colony flourished, other emigrants came, and a town was founded on the eastern shore of Port Nicholson, and was named Britannia, but the name was afterwards changed to Wellington. At length, in the early part of 1841 New Zealand was proclaimed an independent colony, the association was incorporated by royal charter, and a governor was appointed by the crown. New Plymouth was founded by the association on the west coast of New Ulster, and another set of colonists afterwards arrived, under the direction of Captain Arthur Wakefield, a naval officer, and another brother of E. G. Wakefield, by whom the town of Nelson was founded at the bottom of Blind Bay, at the north-western end of the Middle Island, or New

Digitized by Google

Leinster. Captain Wakefield and some others were murdered by a party of hostile natives June 17, 1843. Edward Jerningham Wakefield returned to England in 1844, and in 1845 published 'Adventure in New Zealand from 1839 to 1844, with an Account of the Beginning of the Colonisation of the Islands,' 2 vols. 8vo, an interesting and apparently a trustworthy narrative.

Edward Gibbon Wakefield did not take any active part in the carrying out of his own system. Indeed in 1839, when the New Zealand colonisation was taking place, he accompanied the Earl of Durham to Canada as his private secretary, and his advice is understood to have had great weight in the measures there adopted. In addition to the works above mentioned he published in 1831 'Facts on the Punishment of Death in the Metropolis,' 8vo, and commenced in 1836 an edition of Smith's 'Wealth of Nations,' which was however left incomplete. [*See* SUPPLEMENT.]

WAKEFIELD, REV. GILBERT, was born the 22nd of February 1756, in the parsonage-house of St. Nicolas of Nottingham, and was the third son of the Rev. George Wakefield, then vicar of that parish. After having been taught to read at home, Gilbert was sent, in May 1759, to a school kept by an old lady at Nottingham; in his fifth year he was put to a writing-school; from that he went at the age of seven to the Nottingham free grammar-school; which two years after he exchanged for that of Hilford, in the neighborhood of his native town. In 1767, on his father's removal to Kingston, or rather to Richmond, where he took up his residence, that chapelry being annexed to the vicarage, he was put to a school kept by his father's curate, under whom he began the study of Greek; from this teacher, whom he describes as miserably incompetent, he was transferred two years after to the charge of the Rev. Richard Wooddeson, at Kingston, with whom he remained till that gentleman gave up his school and removed to Chelsea in 1772; when Wakefield, now in his seventeenth year, was sent to Jesus College, Cambridge.

Here he applied himself almost exclusively to classical studies. In the third year of his residence he wrote for Dr. Brown's three medals; and although he admits that his Greek Ode and his two epigrams (one Greek, the other Latin) were worthless, he maintains that his Horatian Latin ode, which also failed, deserved a better fate. In 1775 he commenced the study of Hebrew; having accidentally discovered what he calls "the abominable stupidity—a stupidity which no words can sufficiently stigmatise—of learning that language with the points," and obtained a Masclef's Grammar, which enabled him, he says, in the course of ten days, by the help only of Buxtorf's 'Lexicon,' to read nine or ten of the first chapters in Genesis, "without much difficulty and with infinite delight."

In January 1776 he took his Bachelor's degree, and in April following he was elected to a fellowship in his college. In the same year appeared his first publication, a small 4to volume of Latin poems, 'Poematæ Latinæ partim scripta, partim reddita,' which was printed at the University press. In March 1778, Wakefield was ordained deacon by Dr. Hinchcliffe, bishop of Peterborough. He had been from his earliest years, as he continued to the end of his life, strongly attached to the study of theology; but his opinions had already begun to take that deviation from the common standard which ultimately carried him out of the pale of the church in which he had been born and educated. About three weeks after his ordination he left the University for the curacy of Stockport in Cheshire, of which the Rev. John Watson was incumbent; but he remained in this situation only for a few months, quitting it before the end of the year for the curacy of St. Peter's at Liverpool,—"principally," he states, "with the view of establishing a day-school in that town, if a suitable opportunity should present itself." In March 1779, he married Miss Watson, the niece of his late rector. "While I continued at Liverpool," he says, "I persevered in reading the New and Old Testaments with all possible attention and assiduity. My objections to the creed of my forefathers were daily multiplying, and my determination was already made to quit the church for some other line of life on the first opportunity. My attachment however to theology would never suffer me to think with tranquillity of transferring myself to any other profession independently of additional objections of a very serious nature to such an alteration in my plan of life."

In August 1779, on the invitation of the trustees of the Dissenting Academy at Warrington, he removed thither to fill the situation of classical master in that establishment. While here, he published, in 1781, his first theological work, 'A New Translation of the First Epistle of Paul the Apostle to the Thessalonians,' 8vo. This was followed in the same year by 'A Plain and Short Account of the Nature of Baptism,' 12mo; and an 'Essay on Inspiration,' 8vo. All three publications were brought out at the Warrington press, as was also 'A New Translation of the Gospel of St. Matthew,' 4to, which he produced in the following year. For the first six years after his leaving college, he intimates, the Greek and Roman writers received a very small portion of his attention; but while at Warrington he prosecuted the study of Hebrew, learned Syriac and Chaldee, acquired, he says, a perfect knowledge of the Samaritan and Syro-Chaldaic, formed some acquaintance with the Æthiopic, Arabic, and Persian, and read the Coptic version of the New Testament. He remained at Warrington till the Academy was broken up in 1783, after it had existed twenty-six years. On this he retired in the first instance to the village of Bramcoate in Nottinghamshire, with the intention of taking pupils into his house; but he did not succeed in procuring any. While here he published anonymously, at London, a small tract in 12mo, entitled 'Directions for the Student in Theology,' and also the first volume, in 8vo, of his 'Enquiry into the Opinions of the Christian Writers of the Three First Centuries concerning the Person of Jesus Christ,' a work which he never carried farther. In May 1784, he removed to his brother's parish of Richmond in Surrey, and advertised for pupils there, but was as unsuccessful as at Bramcoate; and at Michaelmas in the same year he took up his residence in his native town of Nottingham. Up to this time he had continued to preach occasionally; a sermon which he preached at Richmond on the 29th of July 1784, the thanksgiving-day on account of the peace, was soon after printed; and he also published about two or three sermons in Nottingham between 1785 and 1786. But from that last date he became not only wholly alienated from the established church, but its open and bitter assailant, although he never joined any body of dissenters. Indeed he came at last to the conclusion that public worship in any form was wrong.

He got some pupils at Nottingham, and remained there for six years. During this period his publications were—an edition of 'The Poems of Mr. Gray, with Notes,' 8vo, Lond., 1786; an edition of 'Virgil's Georgics,' 8vo, 1788, from the Cambridge University press; 'Remarks on Dr. Horsley's Ordination Sermon,' Lond., 12mo, 1788; 'Four Marks of Antichrist,' Lond., 8vo, 1788; 'A New Translation of those parts of the New Testament which are wrongly translated in our Common Version,' Lond., 8vo, 1789; 'An Address to the Inhabitants of Nottingham' (on the Test Laws), Lond., 8vo, 1789; 'Remarks on the Internal Evidence of the Christian Religion,' Lond., 8vo, 1789; 'Silva Critica, sive in Auctores Sacros Profanosque Commentarius Philologus, Pars prima,' 8vo, 1789, from the Cambridge University press; 'An Address to Dr. Horsley, late Lord Bp. Dr. Porteus on the Liturgy of the Church of England,' Birmingham, 8vo, 1790; 'Silva Critica, Pars secunda,' Cambridge, 8vo, 1790; and 'Cursory Reflections on the Corporation and Test Acts,' Birmingham, 8vo, 1790. He always wrote with extraordinary rapidity, and certainly often with very little consideration, and he generally carried to the press with his manuscript before the ink was dry. He was however in his way a hard student, methodical, punctual, and a great economist of his time. In this way he found leisure for a good deal of society, and also for some rather singular indulgences. Writing my abode at Nottingham," he relates, "I never failed to attend all the capital punishments that took place there; courting at all times every circumstance which might read me a wholesome lecture on mortality, or suggest an additional motive of gratitude to God for the comforts of my own condition."

In July 1790 however he was induced to leave this and the other attractions of Nottingham by an invitation to become classical tutor in the dissenting academy at Hackney. But this situation he only held till June 1791. A quarrel with his colleagues finally induced him to give in his resignation, after some minor causes had contributed to make him dissatisfied with his position.

Towards the end of the year 1791 he published at London one of his most considerable works, his 'Translation of the New Testament, with Notes,' in 3 vols. 8vo. This performance, in which he had the good taste to adhere to the words of the existing translation wherever he thought they conveyed the correct sense, was not unfavourably received, and he produced a second edition of it, in 2 vols., in 1795. Its first publication was immediately followed by 'An Enquiry into the Expediency and Propriety of Public or Social Worship,' 8vo, London, 1791, a tract which made some noise, was twice reprinted in this and the next year, and drew forth several answers, to which he replied in two additional expositions of his views published in 1792. In 1791 also appeared a third part of his 'Silva Critica,' printed, like the two former parts, at the Cambridge University press. And in the same year he published, in 1 vol. 8vo, his 'Memoirs' of his own life, which he says that he wrote "all to a little collish," in twelve days. The work certainly has the appearance of having been rapidly composed.

For the next six years his biography is merely the history of the appearance of his successive publications: for, continuing to reside at Hackney, he now sought no other employment than writing for the booksellers. In 1793 he brought out a fourth part of his 'Silva Critica,' at London, at his own expense, the curators refusing him the further use of the Cambridge press. The same year he published, in 8vo, a treatise on the 'Evidences of Christianity,' being an enlarged edition of the same tract on the same subject that appeared in 1789. He now turned for the first time to politics, or to theologico-political discussion, and in 1794 published three pamphlets: 'The Spirit of Christianity compared with the Spirit of the Times in Great Britain,' which went through three editions; an answer to Paine, under the title of 'An Examination of the Age of Reason,' of which a second edition was called for the same year; and a vehement philippic against the war with France, in the form of 'Remarks on the General Orders of the Duke of York to his Army.' Then, striking into another new path, he produced his first complete edition of an ancient classic—a Horace, with notes, and what he called an amended text—in 2 vols. 12mo, London, 1794. It is renowned for a proposed conversion of 'O beate Sexti,' in the 4th ode of the 1st book, into 'O bea te, Sexti,'

Digitized by Google

which is set down without a thought being given to the inadmissibility of such a reading on the most obvious metrical grounds. The Horace was followed the same year by a selection of Greek Tragedies, in 2 vols. 8vo, and that by a first volume of an edition of the 'Works of Pope,' 8vo, Warrington, which was not continued. A fifth part of the 'Silva Critica,' 8vo, London, a 12mo volume of 'Poetical Translations from the Antients,' an edition, in a volume of the same size, of the remains of Bion and Moschus, and a 'Reply to the Second Part of Paine's Age of Reason,' 8vo, all appeared in 1795. His publications of the next year were:—an edition of Virgil, with few notes, in 2 vols. 12mo: an 8vo volume of 'Observations on Pope;' 'A Reply to the Letter of Edmund Burke, Esq., to a Noble Lord,' which went through three editions; and a new edition, with notes, of Pope's Translation of the Iliad, in 12 vols. 8vo. This year also appeared the first volume, in 4to, of his Lucretius, of all his editions of ancient authors the one that was most wanted and upon which he has bestowed the greatest pains, and the only one that remains in any estimation. The second and third volumes followed in the course of the succeeding year, 1797; which gave birth besides to a Latin pamphlet—'Diatribe Extemporalis,' as he entitled it—an Person's new edition of the 'Hecuba;' 'A Letter to Jacob Bryant, Esq., concerning his Dissertation on the War of Troy,' 4to; and 'A Letter to William Wilberforce, Esq., on the subject of his late Publication' (his 'Practical View of Christianity'). The last-named work reached a second edition.

In January 1798, Dr. Watson, bishop of Llandaff, came forward in the new character of a champion of the war, in a pamphlet which he entitled 'An Address to the People of Great Britain.' Both the drift of this address, and what seemed to him the apostacy of the writer, kindled Wakefield's very combustible temper; and on the very morning of the day on which it came into his hands he finished a very vehement 'Reply to some parts of the Bishop of Llandaff's Address,' which he immediately sent to the press. It was published by Mr. John Cuthell, of Middle Row, Holborn, a dealer in old books, for whom he brought it without any intimation of its nature. Cuthell was thereupon indicted for the publication of a seditious libel; and being tried before Lord Kenyon and a special jury at Westminster, on the 21st of February 1799, was found guilty, and on the 18th of April following was sentenced to pay a fine of thirty marks. Wakefield and Cuthell all the expenses to which he had been put, amounting to 153l. 4s. 8d., a sum which he afterwards described as equal to the clear annual income of all he was worth. Wakefield himself was also tried at Westminster (the trials of him and Cuthell; and Johnson, a bookseller, who had sold some copies of the pamphlet, a few days after before the same judge at Guildhall: we are not informed what was Johnson's sentence; but Wakefield, who, in the interim between the conviction of Johnson and his being himself brought up for judgment, published 'A Letter to Sir John Scott, Attorney General,' a stinging general, on the subject of a late trial in Guildhall' (that of Johnson), was sentenced by Mr. Justice Gross, on the 30th of May, to be imprisoned in Dorchester jail for two years, and to give security for his good behaviour for five years after the expiration of that term, himself in 500l., and two others in 250l. each. A subscription was immediately raised for him among the friends of opposition politics, which ultimately amounted to about 5000l. He printed and gave away, but did not regularly publish, his 'Defence,' and two subsequent addresses to the Court of King's Bench, one actually delivered, the other only intended to have been delivered; and he bore with fortitude and good humour his two years' incarceration, which with the exception of some impositions in money matters by the jailor, does not appear to have been attended with any unusual hardship. While in prison he print-d an imitation, in English verse, of the Tenth Satire of Juvenal, 12mo, 1800; and also the same year a translation, in an 8vo pamphlet, of 'Some Essays of Dion Chrysostom, with Notes.' In 1801 he published a small 12mo tract on some discoveries which he supposed he had made as to the laws of Greek hexameter verse, under the title of 'Noctes Carcerariæ.' His release took place on the 29th of May 1801; upon which he immediately hurried to London, and commenced a course of lectures on the Second Book of the Æneid, the delivery of which occupied him till the beginning of July. On the 27th of August he was taken ill of a disease of a typhus fever, which carried him off on the 9th of September. He left, besides his widow, four sons and two daughters.

All Wakefield's publications have been mentioned in the above sketch, except an 'An Essay on the Origin of Alphabetical Characters' (endeavouring to prove that they must have been revealed from Heaven), which he communicated, in 1784, to the Literary and Philosophical Society of Manchester, and which is printed in the second volume of their Transactions, and, in an enlarged and amended form, with the second edition of his Memoirs; and many papers which he contributed to various periodical publications, especially the 'Theological Repository' and the 'Monthly Magazine.' He had also made considerable collections for a Greek and English Lexicon, which remained after his death in possession of his family. A new edition of his Memoirs, extended to two volumes, and brought down to the close of his life, was published by his friends, Messrs. John Towill Rutt and Arnold Waisewright, in 1804; and a 'Collection of Letters' that passed between him and Charles Fox, chiefly upon points of classical criticism, has since been published.

His scholarship, in its amount and character, has been ably estimated by Dr. Parr, in a letter printed in the second edition of his Museiris, vol. ii., pp. 437-453, although his deficiencies may perhaps be thought to be touched by his friend and admirer with a lenient hand. He had evidently read rapidly a great deal of Greek and Latin, and, by the help of a memory which he used to complain of as too good, had retained an unusually large proportion of the miscellaneous intellectual sustenance which he had thus taken in; but, partly from imperfections in the manner in which he had been educated, partly from defects of mental character, he was not and never could have become either a pro'ound or a refined scholar. Both his Latin style and his English are vicious and barbarous in the extreme. Honest and high-minded he certainly was, as well as warm-hearted; but his ardour became intemperance and ferocity whenever it encountered opposition, and his honesty only made him the more intolerant of difference of opinion upon any subject in another, a thing for which he had no name except only knavery or imbecility. No man ever adhered to the most maturely considered conclusions with more pertinacity than he did to judgments which he would form in the most precipitate manner.

WALAFRIDUS, or WALHAFRIDUS, surnamed 'Strabo,' or 'Strabus,' because his eyes were awry, was a German monk who lived in the first part of the 9th century. Some writers have thought that he was a native of Anglo-Saxon, and a brother of Bede, but fabricius proves by the monk's own words that he was a native of Suabia in Germany, an opinion which now seems to be general. He received his education in the monastery of St. Gallen, which was then one of the most famous schools in Germany, and he finished his studies in the monastery of Fulda, under the celebrated Rabanus Maurus. After having taken orders, he became dean of St. Gallen, and in 842 he was chosen abbot of Reichenau (Augia Dives) in the diocese of Constance. It is said that for some time he was head master of the school in the monastery of Hirsfeld. He died in 849, in France, where he was travelling on some business. Walafridus was a learned man for his time; he is the author of several works on divinity, ecclesiastical history, and botany; the most remarkable are:—'De Officiis Divinis, sive de Exordiis et Incrementis Rerum Ecclesiasticarum,' which is published in the 'Bibliotheca Patrum Maximæ,' and in several other collections of early writers on divinity; 'Vita B. Galli Confessoris,' in Goldast's 'Scriptores Rerum Alemannicarum;' 'Vita S. Othmari Abbatis,' in Goldast's 'Vita S. Biatmnici Abbatis, Hiensis, et Martyri,' in 'Acta Sanctorum,' 'Bibliotheca Patrum Maximæ,' and in several other collections; 'Hortulus'—this little work on botany, which is much esteemed, is written in Latin verse; it was published at Nürnberg, 4to, 1512; 8vo, Freiburg im Breisgau, 1530; 8vo, Frankfurt-on-the-Main, 1564, 1571; Venice, 1547; Basel, 1627; it is likewise contained in several collections, as in the 'Bibliotheca Patrum Latina,' in the 'Bibliotheca Patrum Coloniensis,' &c.; 'Glossa Latino Barbarica de Partibus Humani Corporis rursum ex Doctrina Rabani Mauri per Walafridum descripta,' in Goldast cited above. 'Glossa ordinaria interliverans in Scripturam Sacram:' it has been supposed that Rabanus Maurus is the author of it, and that Walafrido only put it together. Editions of it are contained in the different 'Bibliothecæ Patrum,' as well as in some other collections cited above. The first edition is a large finely-printed folio, without date or place, and supposed to have been printed at Venice about 1480. Some French writers attribute to Walafridus the beginning of the celebrated 'Annales Fuldenses.' A complete catalogue of the works and other literary productions of Walafridus is contained in Fabricius, 'Bibliotheca Latina Mediæ et Infimæ Ætatis.'

WALCH, JOHANN GEORG, a distinguished German divine, was born at Meiningen, in 1693. His father was general superintendent of the Protestant church in the duchy of Saxe-Weimar. In 1710 he went to the university of Jena, where he studied divinity and philology, and of which he became afterwards one of the professors. In 1724 he was appointed extraordinary professor of divinity in the university of Jena; and in 1726 he took his degree of D.D., and was appointed ordinary professor of divinity, an office which he held till his death, January 18, 1775.

Walch distinguished himself as a scholar at a very early age. In 1712, when he was only nineteen, he published a good edition of Velleius Paterculus, which he accompanied with an index and valuable notes; in 1714 he published 'Diatribe de Vita et Stilo C. Cornelii Taciti,' a work characterised by sound judgment, though the production of a youth of twenty-one. His works are numerous, the principal are:—1, 'Philosophisches Lexicon, darin die in allen Theilen der Philosophie furkommenden Materien und Kunstwörter erklärt werden,' 8vo, Leipzig, 1726. This work ran through four editions, and was a standard book till new philosophical terms came in use, together with the establishment of the school of Kant, which in its turn was superseded by the systems of Fichte, Hegel, and Schelling. 2, 'Historia Critica Latinæ Linguæ,' 8vo, Leipzig, 1716; ran through four editions. 3, 'Historische und Theologische Einleitung in die vornehmsten Religions-Streitigkeiten der Evangelischen Kirche,' 5 vols. 8vo, Jena, 1724-36. 4, 'Historische und Theologische Einleitung in die vornehmsten Religions-Streitigkeiten der Evangelischen Kirche,' 5 vols. 8vo, Jena, 1730-39. 5, 'Bibliotheca Patristica literaria Adcatechumbus instructa,' 8vo, Jena, 1720; 2nd edition, Jena, 1834, by Professor Danz. 6,

Digitized by Google

'Bibliotheca Theologica selecta, literaris Adnotationibus instructa,' 4 vols. 8vo, Jena, 1757-65. 7, Dr. Martin Luther's 'Sämmtliche Schriften,' 24 vols. 4to, Halle, 1740-50. A carefully revised edition of the works of Luther; the 14th volume contains Luther's Latin version of the Bible, which was separately published by Walch in 1745. Walch also published an edition of Lactantius, Leipzig, 1715; 2nd edition, 1735. Walch was the father of three sons, Johann Ernst Immanuel, Christian Wilhelm Franz, and Karl Friedrich, noticed below, each of whom attained a high rank in the learned literature of Germany.

WALCH, JOHANN ERNST IMMANUEL, the eldest son of Johann Georg Walch, was born at Jena on the 29th of August 1725. He studied divinity at Jena, and in 1747 undertook a long journey with his brother Christian Wilhelm Franz, to France, Italy, and several other countries. Through the two brothers's name rather young, the name of their father procured them everywhere a favourable reception. They thus were on intimate terms with Assemani, the cardinals Maffei and Passionei, as well as with several other celebrated men at Rome. It is said that they were presented to Pope Benedict XIV., who asked them if they were the sons of the celebrated heretic J. G. Walch. In 1759 J. E. I. Walch was appointed professor of divinity at Jena, his name being already known by several works on ecclesiastical history. Next to divinity, natural history was his favourite science, which he cultivated with great success, as may be seen from his works on natural history, cited below. He was a member of many learned societies in Italy, Germany, and other countries. He died on the 1st of December, 1778. His principal works are—1, 'De Christianorum sub Diocletiano in Hispania Persecutione,' 8vo, Jena, 1751; 2, 'Miscellanea sacra antiquum Vexationis Christianorum Neronianas insigne Documentum illustratum,' 4to, Jena, 1750; 2nd edition, under the title 'Persecutionis Christianæ Neronianæ in Hispania ex antiquo Monumento probandæ uberior Explanatio,' 4to, Jena, 1753; 3, 'Acta Societatis Latinæ Jenensis, edita,' 4 vols. 8vo, Jena, 1752-55. The 'Transactions' of this Society, which were under the care of Walch for several years, contain many of his minor productions. 4, 'Dissertationes in Acta Apostolorum,' 3 vols. 4to, Jena, 1756-61; 5, 'De Arte critica veterum Romanorum Libellus,' 3rd edition, Jena, 1771; 6, 'Die Steinreich systematisch entworfen' (a system of mineralogy), 2 vols. 8vo, 2nd edition, Halle, 1769; 7, 'Antiquitates Medicæ selectæ,' 8vo, Jena, 1772; 8, 'Sigilium Mediei Ocularii Romani nuper in Agro Jenensi repertum et Observationibus illustratum,' 4to, Jena, 1763; 9, 'Georg Wolfgang Knorr's Sammlung von Merkwürdigkeiten der Natur und den Alterthümern des Erdbodens welcher petrificirte Cörper enthält, herausgegeben mit Classificatione-Tabellen, &c., von J. E. I. Walch, mit illuminirten Kupfertafeln, etc.,' 7 parts, in 3 vols. folio, Nürnberg, 1768-73. Walch's collection of fossils was celebrated in all Europe. Statius Müller had published a catalogue of it, with a description of the different objects, but this work was incomplete and without any systematical order. The work of Walch however is still considered a model for similar works: a French translation of it was published in 1775, and a Dutch in 1776.

(Lebensgeschichte des wohlseligen Herrn Hofraths Johann Ernst Immanuel Walch, 8vo, Jena, 1780, contains a complete catalogue of his works and minor productions: a *Leben und Character des Prof. Joh. Ernst Im. Walchs* appeared at Weimar, 8vo, 1780.)

WALCH, CHRISTIAN WILHELM FRANZ, one of the greatest divines of Germany, was the second son of Johann Georg Walch. He was born at Jena in 1726, and after having studied divinity in that university, travelled with his brother Immanuel in France and Italy. The learned Italian Gori invited him and his brother to contribute to his 'Symbola Literaria,' and Gori wrote several memoirs for the 'Transactions' of the Societas Latina at Jena. In 1750 Walch was appointed extraordinary professor of philosophy in the University of Jena; in 1753 he was chosen president of the Societas Latina in this town; in 1754 he went to Göttingen as extraordinary professor of divinity; he became ordinary professor of divinity in 1757. He died suddenly in 1784, whilst talking with his wife and children.

Walch wrote many works on classical literature, divinity, and ecclesiastical history, some of which are among the best of their kind, and they all bear the marks of a superior mind and extensive learning. A complete catalogue of his works is given in the authority cited below; and the greater part of them are in the library of the British Museum. The following are the principal works:—1, 'Antiquitates Pallii Philosophici veterum Christianorum,' Jena, 1746. The first section of the book treats of the pallium of the ancient philosophers; and the second of the pallium assumed by Christian philosophers. 2, 'Oratio de Eloquentia Latina veterum Germanorum,' 1750; an interesting little book, in which the author shows that a considerable number of ancient Germans, among whom was Arminius, the conqueror of Varus, were well acquainted with the Roman language and literature: there are no hypotheses or opinions in this book; it is founded on facts stated by Roman authors. 3, 'Historia Patriarcharum Judæorum quorum in Libris Juris Romani fit Mentio,' 1751. The object of this work is to show that even during the later period of the Roman Empire the Jews continued to live under the moral inspection of 'patriarchs,' a Greek word translated from the Hebrew, and which, according to Walch, was first used by the 'Seventy' of Alexandria; the Roman laws referred to by the author are the titull, 'De Judæis,' 'Coelicolis,' and 'Samaritanis,' in the Codex of Theodosius and Justinian. 4, 'Compendium Historiæ Ecclesiasticæ recentissimæ,' Göttingen, 1757. 5, 'Entwurf einer vollständigen Historie der Kirchen-Versammlungen,' Leipzig, 1759. 6, 'Monimenta Medii Ævi ex Bibliotheca Regia Hanoverana,' 3 vols. 8vo, Göttingen, 1763. 7, 'Grundsätze der Kirchengeschichte des Neuen Testaments,' 4 vols. 8vo, 2nd edition, Göttingen, 1772-74. 8, 'Grundsätze der Natürlichen Gottesgelehrsamkeit,' 2nd edition, Göttingen, 1775. 9, 'Kritische Untersuchung von Gebrauch der Heiligen Schrift unter den alten Christen in den ersten vier Jahrhunderten,' Leipzig, 1779. 10, 'Neueste Religions Geschichte,' 9 vols. 8vo, Lemgo, 1771-83. 11, 'Bibliotheca Symbolica vetus ex Monimentis Quinque priorum Sæculorum maxime collecta,' &c., Lemgo, 1770. 12, 'Bibliotheca Philologica,' 3 vols. 8vo, Göttingen, 1770-77. 13, 'Entwurf einer vollständigen Historie der Ketzereien, Spaltungen, und Religions-Streitigkeiten, bis auf die Zeiten der Reformatioo,' 11 vols. 8vo, Leipzig, 1762-85. This work made great sensation throughout all Europe, and the Germans call its author generally, Der Ketzer-Walch (Ketzer signifies a heretic), in order to distinguish him from his brother, his father, and so many other writers whose name is Walch. Walch is also the author of an excellent biography of Catherine von Born, the wife of Luther, which is preceded by her portrait engraved after the original painting of Lucas Cranach. KARL FRIEDRICH, the younger brother of Christian Walch, born in 1734, was professor of law at Göttingen, and afterwards at Jena, where he died in 1799. He is the author of several distinguished works on jurisprudence, such as, 'Glossarium Germanicum Interpretationi Constitutionis Criminalis Carolinæ inserviens,' Jena, 1790. The Carolina Criminalis Ordinatio Criminalis Juris, the Criminal Code issued by the Emperor Charles V., is still in use in some parts of Germany, as the duchy of Brunswick and the Kingdom of Hanover.

(Strodtmann, *Das Neue Gelehrte Europa*, part 14, in vol. iv.)

WALDECK, PRINCES OF. The house of Waldeck is one of the oldest dynasties of Northern Germany. It is of Saxon origin, and is descended from one of those powerful dukes of ancient Saxony who commanded in the wars against Charlemagne, perhaps from Wittekind, although this cannot be historically established. They were formerly counts, but the title of prince was conferred upon Count George Frederic in 1682. This prince, born in 1620, was a celebrated general of the emperor Leopold I., and obtained several signal victories over the Turks and the French. Delille, the French poet, has addressed to him his ode 'De la Pitié,' praising him for his humane conduct towards the French. The republic of the United Provinces of the Netherlands appointed him commander-in-chief of the Dutch armies. He died in 1692. His brother, Count Josias, had equal military reputation. The republic of Venice put him at the head of her armies, and after his death, in 1711, had a splendid monument erected to his memory in the church of Wildungen, in the principality of Waldeck. Josias was the founder of a younger branch of the house of Waldeck, upon which however the title of prince has not been conferred. Prince Christian Augustus, born in 1744, signalised himself as an able general in the wars against the French during the revolution. He commanded a part of the imperial armies. In 1793 he directed the passage of the imperial troops over the Rhine near Selz, for the purpose of attacking the rear of the famous lines of Weissenburg, defended by the French: they were assailed in front by Field-Marshal Wurmser, the Austrian commander-in-chief, and Field Marshal Kalckreuth, the Prussian generalissimo. This combined attack, which resulted in the taking of the lines, and was followed by a general rout of the French, is considered one of the most brilliant manœuvres executed in modern times. It is said that the Prince of Waldeck, who had the most difficult part in this undertaking, also conceived the idea of the whole plan. He also took the fortress of Kehl, opposite Strasbourg, and afterwards commanded in Flanders, displaying such superior talents that the emperor Francis shortly appointed him member of the military council at Vienna, and commander-in-chief of the militia of Bohemia. In 1797 the Prince Regent of Portugal addressed himself to the emperor for the purpose of obtaining his permission to put the Prince of Waldeck at the head of his armies, which were in a very disorganised state. The request having been granted, this prince went to Lisbon, but died in 1798, before he had carried into effect his plans for reorganising the Portuguese troops. His great-grandson, George Victor, the present reigning prince, was born in 1831, and succeeded his father, Prince George Frederic Henry, in 1845. (See SUPPLEMENT.)

WALDEGRAVE, JAMES WALDEGRAVE, SECOND EARL, was the son of James, first Earl Waldegrave, K.G., who was descended from ancestors originally settled at Walgrave in Northamptonshire, and in later times distinguished for their attachment to the Roman Catholic faith. The first Earl Waldegrave married his eldest sister of Baron Waldegrave of Chewton, in the county of Somerset, from his father Henry, who having married Henrietta, natural daughter of James II., by Arabella Churchill, sister of the Duke of Marlborough, was raised to the peerage in 1685, and, following his father-in-law to Paris on the Revolution, died there in 1689. The earl had conformed to the Established Church in 1722, and served under Sir Robert Walpole, who placed great confidence in him, as ambassador, first at Paris and afterwards at Vienna, from 1725 to 1740. He was created Viscount Chewton and Earl Waldegrave in 1729, and died in 1741, at the age of fifty-seven, six months after he had obtained leave to return to England for the recovery of his health. He had married in 1714,

Digitized by Google

Mary, daughter of Sir John Webbe of Hatherop, in the county of Gloucester, Baronet.

James, who was his eldest son, was born on the 14th of March, 1715. Attaching himself to the court, and becoming a favourite of George II., he was in 1743 appointed a lord of the bedchamber; and in April 1751, among the changes which took place on the death of Frederick, Prince of Wales, he was made steward and warden (or master) of the Stanneries. About a year and a half after this, in December 1752, Lord Waldegrave, as the earnest request of the king, was prevailed upon to accept the office of governor to the young Prince of Wales, which Lord Harcourt had resigned. In 1756 Lord Waldegrave obtained a grant of the reversion of one of the tellerships of the exchequer, and in less than two months after he came into possession of this lucrative appointment by the death of Horace, Lord Walpole. In 1759 he married Maria, the second of the three natural daughters of Sir Edward Walpole, K.B. (second son of Sir Robert), by Maria Clements, a milliner's apprentice, whose father was postmaster at Darlington. This lady, equally distinguished by her beauty and her virtues, was twenty years younger than the earl; and in 1766, after his death, remarried William Henry, duke of Gloucester, brother of George III., whom she also survived, dying in 1807, at the age of seventy-two. She was the mother of the late Duke of Gloucester, and of the Princess Sophia Matilda of Gloucester.

The most important political transaction in which Earl Waldegrave was engaged, was the attempt into which he was forced by the king, in June 1757, to form e ministry, with himself at its head. He was actually appointed first lord of the treasury. "The public," says Walpole, "was not more astonished at that designation than the earl himself." Of the negociations connected with this project, which was abandoned after a few days, a sketch is given by Walpole ('Memoires,' ii. 209-223), but the most ample details have been given to us by the earl himself. Proposals were also made to him to take office in the last days of Lord Bute's administration, in the end of March 1763. The day after he had finally declined these overtures, on the 1st of April, he was attacked by small-pox, and his death followed on the 8th of that month. Leaving only three daughters, he was succeeded in the earldom by his brother John.

An account of the political and court transactions of a portion of his own time by Earl Waldegrave was published under the title of 'Memoirs from 1754 to 1758,' 4to. and 8vo. London, 1821. This work, which had evidently been prepared with the intention that it should be given to the public, is a clear, full, and trustworthy narrative, and throws much light upon the restless and complicated intrigues of the latter part of the reign of George II. It leaves a very favourable impression of his wisdom and moderation, as well as of his sincerity and frankness, although it has nothing of the manner of an anxious or systematic defence of his conduct.

WALDEMAR I., King of Denmark, reigned from A.D. 1157 to 1181. He was the son of Knud, or Canut, Duke of Sleswig, and king of the Obotrites in Mecklenburg, a prince of the first royal dynasty of Denmark. He was born on the 15th of January 1131, eight days after the murder of his father, who perished during the civil troubles which then desolated Denmark. To save her son from a similar fate, his mother, Ingeborg, a Russian princess, fled with him to her native country, where the young prince lived during the earlier part of his youth. He afterwards returned to Denmark, and on the death of King Erik IV., Emund, in 1139, Waldemar was chosen king, but on account of his youth he was put under the guardianship of Erik, surnamed Lam, the son-in-law of the late King Erik III., Eiegod. Erik Lam, disregarding the rights of his ward, usurped the royal authority and reigned as Erik V., till 1147, when he resigned and retired to a convent. The guardianship of young Waldemar was now disputed between Svend Eriksen and Knud Magnussen, both royal princes, and the contest having been terminated by a decision of the Emperor Frederic I., Barbarossa, which was favourable to Svend, that prince assumed the title of king, and in 1156 murdered Knud, who had likewise styled himself king, and reigned in a part of Denmark as Knud or Canut V. Svend also intended to murder Waldemar, who however escaped and made war on Svend, commonly called Sueno IV., whom he defeated in the battle of Viborg, when the usurper was slain by some plundering peasants. This battle was fought on the 22nd of September 1157, and from this day dates the reign of Waldemar, whose rights to the crown were no longer disputed.

During the first years of his reign Waldemar was occupied with restoring domestic peace to his kingdom. In 1158 he made an alliance with Henry the Lion, duke of Saxony, for the purpose of subjugating the Obotrites and other Wendish or Slavonian nations in the north-eastern part of Germany, over which the kings of Denmark and the emperors of Germany had hitherto exercised a nominal authority. The Danish army and navy were commanded by Absalon, the warlike archbishop of Roeskild, who took Arcona, the capital of the Wendish empire, in the island of Rügen, and broke the idols of Swantewit and other gods of the heathen Wendes. In 1170 he took Julin, the Constantinople of the north (Krantz, 'Wandalia,' lib. iii.), and the northern limit of an overland trade with Asia Minor, Persia, and India, the direction of which we may now trace, since the discovery of numerous Arabic coins along the banks of the Dnieper and the Volga. (Rasmussen, De Orientis Commercio cum Russia et Scandinavia Medio Aevo;' a rare book, extracts from which are given in 'Journal Asiatique,' vol. v., 1824, p. 340, &c.)

After these defeats the Wendes of Rügen, Mecklenburg, and the most western part of Pomerania recognised the Danish king as their sovereign, and Waldemar did homage for his conquests to the Emperor Frederic I., whom he met at Lone-le-Saulnier, in the present Franche-Comté. It has been said that he also did homage for his kingdom of Denmark, and this opinion, which has roused the national pride of so many Danish historians, is not without foundation. The title of King of the Wendes, which is still retained among the other titles of the kings of Denmark, dates from the conquests of Bishop Absalon. Waldemar also acquired the most southern part of Norway, which he took from King Erling. The latter years of his reign were troubled by the rebellion of Eskild, bishop of Lund, in Scania, which province belonged to Denmark at that time. Waldemar died on the 12th of May 1181 (some say 1182), at Wordingborg, and it was said that he was poisoned. Waldemar I. was not a warrior only, he is equally distinguished as a legislator; he ordered the laws of several of his provinces to be collected, and he added his own, which are still preserved in the great collections of the Danish law. The Danes call him 'the Great;' but, without prejudice to his merits, this title is more than he deserves. Waldemar's successor was his eldest son Knud or Canut VI., whom he had by Sophia, princess of Pomerania.

(Holberg, Baron af, *Dannemark's Riges Historie*, vol. i., p. 208-247; Krautz, *Saxonia;* *Wandalia;* Mallet, *Histoire du Dannemark.*)

WALDEMAR II., surnamed Seier, or 'the Victorious,' king of Denmark, who reigned from 1202 to 1241, was the second son of Waldemar I. His brother, King Knud, or Canut VI., conferred upon him the duchy of Sleswig, and was assisted by him in the consolidation of the Danish government in the Baltic provinces, which had been conquered by Waldemar I., and in which many more parts were conquered during the reign of Knud VI., namely, Estland, Kurland, and Livonia. During the rebellion of Waldemar, bishop of Sleswig, who likewise belonged to the royal house of Denmark, and who was assisted by Adolphus III., count of Holstein, he took the field for his brother, and they succeeded in conquering Holstein, and in driving out the rebellious prelate, who fled to Germany (1200). After the death of Knud in 1203, Waldemar ascended the throne, and his subjects, as well as his neighbours, soon found that Denmark was ruled by a great king. He indeed established the Danish authority in the Wendish provinces, the population of which, a headstrong but not uncivilised race, was still ready for rebellion. The Danish possessions in Esthland, Kurland, and Livonia having been menaced by the natives, Waldemar availed himself of the occasion to carry a plan into execution which, if not his own idea, was at least realised by him. Chile was to found a Baltic empire, consisting of Denmark, the key and centre of the whole, Holstein, Mecklenburg, all Pomerania, Kurland, Livonia, Esthland, the large islands in the middle part of the Baltic, and the southern part of Sweden and Norway. This vast plan was afterwards conceived and partly realised by the great Gustavus Adolphus of Sweden, and similar empires were founded by the Carthaginians in the Mediterranean, by Mithridates round the Pontus, and on a smaller scale by Venice round the Adriatic Sea and the Archipelago. If this Danish empire was of short duration, it was the result of two causes which have been and always will be equally dangerous to such empires. The immense extent of narrow tracts along the sea-shore afford innumerable points of attack to the continental nations who are excluded from the coast by these tracts, and they can only be defended by a great navy, the chief condition of which is an extensive commerce. Now Denmark being the centre and key of that empire, only the military condition of its existence was fulfilled, while the commercial condition only existed temporarily. The Sound was not open, as it is now, frequented by ships of all nations, for the commerce in the Baltic had a more southerly direction from Russia towards the coasts of Pomerania and Holstein, whence the merchandise was carried overland to Germany and France. However, for a short period, Waldemar, being in possession of Wisby, Calin (or at least the mouth of the Oder, for the town is said to have been entirely (?) destroyed by Bishop Absalon), and also of Lübeck, was enabled, by the advantages which he derived from the merchandise of those towns, to raise that formidable force, the greater part of which he employed in the conquest of Livonia and the adjoining provinces. His army consisted of 160,000 men, and he had a navy of 1200 ships. He sailed for Livonia in 1219. The main body of the army, consisting of Danes, and commanded by Andreas, bishop of Lund, was surprised by the natives and in danger of being cut to pieces, when it was relieved by the king's Wendish and German auxiliaries, who won the day. Tradition says that in the midst of danger a flag fell from heaven, at the sight of which the Danes recovered their courage. This was the 'Dauebrog,' in memory of which the Order of the Dauebrog was founded. The campaign resulted in the conquest of Esthland, Livonia, and Kurland, and a Danish bishop took up his residence at Riga. During the contest of Frederic II. and Otho of Brunswick for the imperial crown, Waldemar assisted Frederic, who in his turn acknowledged him as king of the Slavonians or Wends, a title which had already been assumed by Waldemar I. Waldemar was now the ruler of the North, but his greatness was humbled by the treachery of a petty German count. Henry, count of Schwerin, had some reason to complain of

Digitized by Google

the king, and not having obtained satisfaction, he treacherously seized him in the island of Laaland, brought him on board a vessel ready for that purpose, and carried him to Schwerin. The numerous enemies of the king protected the count, and even Frederic II. acted in a way which clearly showed that he was pleased with the fate of his rival in the North. Pope Honorius III. alone took the part of the captive king, whose assistance he wished to have in his contest with the emperor; and by his mediation Waldemar was released in 1225, on condition of paying 45,000 marks of silver, an enormous sum for the time, ceding Holstein to its legal possessor Count Adolphus IV., and renouncing the sovereignty of Mecklenburg, which from that time was governed by the descendants of its ancient Slavonic kings, the progenitors of the present house of Mecklenburg, as a fief and homage to the emperor. No sooner was Waldemar restored to liberty than he forgot his promises, and aimed at recovering those provinces which he had ceded, and which had been occupied by his enemies. The first in importance among his enemies were Count Adolphus IV. of Holstein, and the citizens of Lübeck, who, during the military government of Waldemar, had prudently attracted to their town the commerce of the Baltic. Waldemar had now to learn that all power was transient which owes its existence merely to the military genius of a king, and is not the result of the well-directed activity of the community. The king was powerful, without having the means of preserving his power, and those industrious citizens, being possessed of such means, were formidable even before they knew it. In the battle of Bornhövd, a village not far from Eutin in Holstein, the Danish army was totally routed, by the united forces of Lübeck, Holstein, and some neighbouring princes, and the king narrowly escaped death or captivity. He concluded peace in 1229, and was fortunate in escaping new humiliations. He renewed the war with Lübeck in 1234, but his navy was destroyed, and he was compelled to grant extensive privileges to the commerce of this town, which soon became known as the head of the Hanseatic confederation. Waldemar employed the rest of his life in the peaceful government of the remainder of his empire. During his reign the clergy and nobility rose to great influence, and the freemen gradually lost their political rights, which we may conclude from the circumstance that the ancient 'things,' or 'dings,' that is, meetings of the whole community, were changed into 'herredage,' or 'lords' days,' that is, assemblies of the lords temporal and spiritual. Waldemar ordered the laws of Jutland to be collected: this is the 'Jydske Lov,' which is still in use in Jutland. It is contained in the great collections of the Danish laws, and there are also several separate editions of it. Waldemar II., sometimes called the Great, and with more justice than his father, died on the 28th of March 1241. His first wife was Margaretha Sambiria, daughter of Premisl Otcon I., Duke of Pomerania. By her death he married Berengaria, daughter of Sancho I., king of Portugal. His eldest son Waldemar, who was married to Eleonora, daughter of Alphonso II., king of Portugal, died before his father, without leaving issue. He was Duke of Slesvig, and is often called King Waldemar III., but he never reigned. The successor of Waldemar II. was his second son, Erik VI., Plogpenning.

WALDEMAR III. (IV.), surnamed Atterdag, was the son of King Christopher, who was deposed in 1326. Waldemar, born in 1315, was chosen king in his stead, but on account of his youth he was placed under the guardianship of Gerd, or Gerhard, count of Holstein, of the house of Schauenburg, surnamed the Arbiter of the North. The Danes, having been oppressed by Gerd, recalled Christopher, in whose hands young Waldemar voluntarily placed his authority. Gerd forced the king to cede him half of his kingdom, and after the death of Christopher, in 1331, he again became guardian of Waldemar, and continued so for nine years. His pupil however was not in Denmark, but was educated at the court of Louis of Bavaria, emperor of Germany. After the murder of Gerd, in 1340, the Danes invited Waldemar, who made his peace with the sons of Gerd, and sold the province of Scania to Magnus, king of Sweden. In 1347 he also sold Esthland, Kurland, and Livonia, which had been conquered by Waldemar II., to the grand-master of the Teutonic Order in Prussia, for 18,000 marks of silver. With the money he raised an army, and although he renounced Livonia and the sister-provinces, he attacked King Magnus of Sweden, in 1361, and forced him to cede Scania. He also conquered the island of Gothland, which remained a Danish province till 1645. He was less successful in two wars with the Hanseatic towns, and he did not obtain peace until he had given up almost the whole commerce of Denmark into the hands of those powerful citizens, who treated the king with great haughtiness. The treaty by which the second war was finished, in 1364, was particularly humiliating for the king: the treaty of peace begins:—'We, the burgomasters, aldermen and citizens of the towns of Lübeck, &c., promise to grant an eternal peace to Waldemar, king of Denmark, the Wends, and Gotha.' This is the first instance of the title of king of the Gothe having been given to the king of Denmark, and it seems that Waldemar assumed it after the conquest of the island of Gothland. The title is still used in Denmark. In 1363 Waldemar gave his daughter Margaretha in marriage to Hagen or Hakon, the son and heir of Magnus, king of Norway. In 1369 he was again involved in war with the Hanseatic towns, and after the destruction of his navy, as well as his army, he begged for peace, in 1370, and ceded to these towns the province of Scania for fifteen years.

Waldemar III. died in 1375, the last of the first Danish dynasty, which had ruled in Denmark from the beginning of Danish history. He left two daughters: Ingeborg, married to Henry, duke of Mecklenburg; and Margaretha, married to Hakon of Norway, as already observed. After the death of Waldemar, one part of the Danes wished to chose Albrecht, duke of Mecklenburg, the son of Ingeborg, for their king, while another part voted for Olaus, the son of Margaretha. A civil war broke out, which however was soon terminated by an agreement that Olaus should be king. But on account of his youth, Olaus was put under the guardianship of his mother Margaretha, who afterwards succeeded in uniting the three Scandinavian kingdoms by the Union of Kalmar.

WALDO, or VALDO, PETER, was born at Vanx, on the borders of the Rhone, in France, early in the 12th century. He acquired a large fortune by commerce in Lyon, when the sudden death of a friend occasioned him to devote himself to a religious life. He sold his goods, and gave the produce to the poor; he caused the Four Gospels to be translated into his native language by Stephanus da Eva, about 1160, and read and explained them to the recipients of his alms. In 1170, from a frequent reading of the Scriptures, he arrived at the conviction that he had equally with the priests the right of preaching the word of God. His theory involved him immediately in a persecution. In 1179 the doctrine was formally condemned by a general council held in the Lateran at Rome, and the condemnation has been repeated more then once. Forced to quit Lyon he retired to the mountains of Dauphiné, and thence, it is said, to those of Piedmont. Here his followers not only adhered to, but increased, and he has thence been assumed to be the founder of the reformed creed of the Vaudois; though Theodore Beza, and Jean Léger, the historian of the sect, contend, and we think with justice, that the sect was of an earlier origin than the time of Waldo, or rather than the time of Waldenses, the followers of Waldo, differ in some degree from the Vaudois, and the two were often confounded by the uninitiated. Mosheim is of the contrary opinion. It is probable however that the nature of his tenets, so well according with those of the Vaudois, may have had considerable effect in consolidating and fixing their creed, and a translation of the Scriptures into the Vaudois tongue is attributed to him. In the earlier persecutions of his followers they were frequently styled Leonists, from the Latin name of the city of Lyon, to which Peter had belonged. He is said to have died at Prague in Bohemia, where he opened his doctrine there; and Protestants admit him as a precursor of Luther. The period of his death is uncertain, but it probably took place about 1190.

WALES, WILLIAM, an English mathematician and astronomer, was born about the year 1734, of parents in humble circumstances. It is not known where he received the rudiments of his education, and it is probable that he was one of the many persons who, for their attainments in science, owe more to nature and intense application than to the precepts of a teacher.

He first distinguished himself as a contributor to the 'Ladies' Diary,' a work containing an extensive collection of mathematical propositions with their solutions. It was begun in the year 1704; and under the able direction of Leighton, Thomas Simpson, and Dr. Charles Hutton, it had no small influence in promoting the advance of science in this country during the 18th century: it may be added that it still numbers among its contributors several eminent mathematicians. Many of the solutions which were given by Mr. Wales, are signed with his own name, but occasionally they appear under fictitious signatures.

The merit shown in these solutions appears to have procured for him a recommendation to the government; and in 1768 he was appointed, together with Mr. Dymond, to go to Hudson's Bay, for the purpose of observing in that region the transit of Venus over the sun's disk, which was to take place in the following year (*June* 1769). The observations were made at Fort Prince of Wales, and each of the observers was so fortunate as to witness the exterior and interior contact at both the commencement and end of the transit. Mr. Wales made at the same place a great number of astronomical observations, one series of which was published in the 'Philosophical Transactions' for 1769; and again, in 1772, in a separate work, entitled 'General Observations made at Hudson's Bay,' &c., 4to, London. He also, principally, as he observes, for amusement during the many dreary hours which he passed on the shores of Hudson's Bay, computed tables of the equations to equal altitudes, for facilitating the solution of the problem relating to the determination of time: these tables were first published in the 'Nautical Almanac' for 1773; and again, in the year 1794, in his tract entitled 'The Method of Finding the Longitude by Timekeepers,' 8vo.

Mr. Wales returned to England in 1770, and in 1772 he published 'The two books of Apollonius concerning Determinate Sections,' 4to, London. In the same year he was appointed, together with Mr. Bayly, and with the title of astronomer, to accompany Captain Cook in his second voyage for the circumnavigation of the earth; and on the return of the expedition he was (in 1776) elected a fellow of the Royal Society. The series of astronomical observations which had been made during the voyage, with an introduction by Wales, was published in 1777, at the expense of the Board of Longitude, in a quarto volume, with charts and plates. In the same year was published by Wales a tract entitled 'Observations on a Voyage with Captain Cook;' and in

Digitized by Google

1778, his strictures on an account of the same voyage, which had been published by John George Forster, who, with his father, had sailed with the expedition as naturalist. [FORSTER, J. R.; FORSTER, J. G.] In this work the accusations made by the elder Forster against the captain and his officers are shown to be entirely without foundation.

In 1776 Mr. Wales again embarked with Captain Cook in the Resolution, on the third voyage of that navigator to the Pacific Ocean: he returned with the expedition in 1780; and soon afterwards, on the death of Mr. Harris, he was appointed mathematical master of Christ's Hospital. He was subsequently made secretary to the Board of Longitude; and both these posts he filled with credit till his death, which happened in the year 1798, when he was about sixty-four years of age.

He published, in 1781, 'An Enquiry concerning the Population of England and Wales;' and in 1788, 'Astronomical Observations made in the Voyages of Byron, Wallis, Carteret, and Cook,' 4to, London.

In 1739 the French captain De Rouvet had discovered, to the south of the Cape of Good Hope, an island, to which he gave the name of Ile Bouvet, or Cap Circoncision; but its geographical position being erroneously stated, Captain Cook, in his voyages to the south, had been unable to find it, and he was led to suspect that the French seaman had mistaken some bank of ice for an island. On this occasion Lemonnier ungenerously stated, in a paper which was read at a sitting of the Académie des Sciences, that Cook from jealousy had sought for the island under a meridian different from that which had been assigned to it; and Mr. Wales published a pamphlet in which the statement is disproved. The island, or cape, is now supposed to have been that which was, in 1808, discovered by the Swan and the Otter in 56° 20' S. lat. and about 2° E. long. from Greenwich.

Mr. Wales is said to have been the author of the dissertation on the achronychal rising of the Pleiades, which is annexed to Dr. Vincent's 'Voyage of Nearchus.'

WALKER, CLEMENT, is known as the author of a work entitled 'The History of Independency,' the first part of which was published in a small 4to, under the pseudonym of Theophilus Verax in 1648, in two editions, one much more extended than the other; the second (a much more considerable volume) in 1649; the third, under the title of 'The High Court of Justice, or Cromwell's New Slaughter House,' in 1651. A fourth part, by a different writer, who calls himself 'T. M., Esq., a Lover of his King and Country,' appeared in 1661, along with a reprint of the other three parts, in which the second has the new title of 'Anarchia Anglicana.' In this edition the work is entitled 'The Compleat History of Independency.' The first part has been reprinted by Baron Maseres, in his 'Select Tracts relating to the Civil Wars,' 2 vols. 8vo, 1815.

The little that is known of the personal history of Clement Walker is chiefly to be found in Wood's 'Athenæ Oxonienses' and in his own work. He was born at Cliffe, in Dorsetshire, towards the close of the 16th century, and there he appears to have spent the early part of his life: the register of that parish, according to Hutchins, in his 'History of Dorsetshire,' records the births or baptisms of three sons of Mr. Clement Walker and Frances his wife: Thomas in 1626, Antony in 1629, Peter in 1631. Wood mentions another son, John, a scholar, a commoner of Lincoln College, Oxford. This John told Wood that his father had studied at Christchurch in that university, but no record of his matriculation there remained. Before the breaking out of the contest between the king and the parliament, he lived, Wood tells us, on his estate at Chatterstone, near Wells, in Somersetshire, and held the appointment of usher of the Exchequer. At this time he was reputed both a sound royalist and a good churchman, holding puritanism as well as dissent in avowed dislike. Nevertheless, when matters came to a crisis he declared himself for the popular party, and was on that profession returned as one of the members for the city of Wells to the memorable second parliament of 1640. But notwithstanding what is thus asserted by the Oxford antiquary, we must not too hastily assume that Walker at this time really changed either his professions or his principles. He appears to have continued to the end of his life attached to the monarchical part of the constitution, and he had probably been from the first opposed to the excesses of prerogative. In parliament he necessarily acted with the Presbyterians, as on the whole coming nearest, in the course they followed, to his own principles, and his ability and reputation for integrity soon acquired him considerable ascendancy with his party. But his book is by no means, as it has been generally represented, an indiscriminating defence and laudation of that section of the house. He is however, it must be admitted, unsparingly severe in his castigation of the dominant Independent faction, and can see nothing but hypocrisy, fraud, violence, and the destruction alike of all order and liberty in the proceedings of Cromwell and his associates. Yet his work has preserved a good many minute facts not elsewhere to be found; and although the author sees no sense, and no good of any kind, either to the right hand or to the left of the middle way in which he and his friends attempted to walk, it throws a considerable, though it may be a highly-coloured, light on the events and characters of the time. Walker also published soon-mously several other short tracts against the republican government, a list of which, so far as they are known, may be seen in Wood: the most important of them are incorporated in his History. His authorship of that work was discovered soon after the appearance of the second part, upon which he was immediately consigned by Cromwell to the Tower, but he was not debarred the use of his weapon, the pen, and while in confinement he wrote and sent to the press the third part of his History, which, as may be conjectured from the title, is the most violent portion of it. In fact he never recovered his liberty, but died in the Tower, in October 1651.

Walker was one of the two prosecutors (William Prynne being the other) of Colonel Fiennes before the council of war, at St. Albans, in November 1643, for the surrender of Bristol. (See the proceedings in 'State Trials,' iv. 185.) Lord Clarendon upon this occasion describes Walker as "a gentleman of Somersetshire, of a good fortune, and by the loss of that the more provoked; who had been in the town when it was lost, and had strictly observed all that was done."

WALKER, SIR EDWARD, is said to have been the son of a Roman Catholic gentleman, Edward Walker of Roobers, in Netherstowey, Somersetshire. In early life he appears to have held some office in the household of Thomas, twentieth Earl of Arundel (the collector of the Arundelian Marbles), by whose interest he was made in 1637 Rouge Dragon Pursuivant-at-Arms in ordinary, and Chester Herald-at-Arms; and, having accompanied the Earl of Arundel as his secretary on the expedition to Scotland in 1639, he then became known to Charles I., who, after taking him into his service, made him his secretary-at-war, and to that added, in June 1644, the appointment of clerk extraordinary of the privy council. In this latter year also, while he was with the king at Oxford, the university conferred on him the degree of M.A.; and, in 1645, he received the honour of knighthood. After the execution of his royal master, Walker fled to Charles II., whom he accompanied to Scotland in 1650, and, after the failure of that enterprise, rejoined on the Continent. Charles, during his exile, made him Garter King at Arms; and after the Restoration, he was appointed one of the clerks of the privy council. Both these offices he held till his death, at Whitehall, 19th February 1677.

Walker is several times mentioned by Lord Clarendon, whom he is said to have assisted in the parts of his history which relate to military transactions.

In 1705 there was published in London a folio volume, entitled 'Historical Discourses upon several occasions, by Sir Edward Walker, Knight, &c.' It is dedicated to the queen in an address signed Hugh Clopton, and there is also a dedication of the Discourses by Walker himself, "to his grandchild, Edward Clopton, Esq. of Clopton," dated 1664, followed by a postscript, dated 1674, at Clopton, near Stratford-on-Avon, for checking them to be made public after his death. It is quite clear that all the Discourses were printed for the first time in 1705. In 1820 was published, in London, in an 8vo volume of 131 pages, with plates, 'A Circumstantial Account of the Preparations for the Coronation of his Majesty King Charles the Second, and a minute detail of that splendid ceremony, &c., from an original manuscript by Sir Edward Walker, Knight, Garter principal King at Arms at that period.'

The common biographical accounts attribute to Sir Edward Walker an historical tactica, entitled 'Military Discoveries,' published in folio, in 1705; and also the following works, which are stated to have appeared in his lifetime, but the dates of none of which are given:—'Iter Carolinum, being a succinct account of the necessitated marches, retreats, and sufferings of his Majesty King Charles I., from January to 1646, to the time of his death, in 1648, collected by a daily attendant upon his sacred Majesty during all that time,' folio; 'Acts of Knights of the Garter in the Civil Wars;' 'Account of the Celebration of St. George's Day at Windsor in 1674.' We have not been able to ascertain the existence of any of these alleged works. The substance of the 'Iter Carolinum,' however, appears to be contained in the 'Historical Discourses,' the first of which is entitled 'The History, Progress, and Success of the Arms of King Charles I., from 30 March to 23 November 1644, written by his Majesty's special command, and corrected almost in every page with his own hand;' and the second, 'Memoriale of his Majesty's unfortunate success in the year following.' The seventh discourse is entitled 'Observations on L'Estrange's Annals of Charles I.;' and the eighth is a 'Review of the entire reign of that king.' The third is a 'Journal of the Expedition of Charles II. to Scotland in 1650-51.' The fourth discourse is entitled 'The Life and Actions of Thomas Howard, Earl of Arundel and Surrey.' The fifth professes to be a full answer to William Lilly's 'Monarchy or No Monarchy;' and the sixth consists of 'Observations' upon the incongruities and the frequent promotions to titles of honour since the accession of James I.

WALKER, REVEREND GEORGE, the heroic defender of Londonderry, was born of English parents in the county of Tyrone in Ireland, and, after being educated in the University of Glasgow, took orders in the established Church, and became rector of Donoughmore. When King James landed in Ireland after the revolution, Walker raised a regiment at his own expense to oppose him. On the approach of James to Londonderry, he went out to meet him at the head of a body of troops at Long Causeway, but after a resolute defence was obliged to retire into the town, which he found Lundie, the governor, preparing in all haste to leave. Destitute as the place was of all apparent means of standing a siege, Walker and Major Baker, who had

Digitized by Google

succeeded Lundie in the command of the garrison, determined to hold out as long as possible, in the hope that King William would, before they were exhausted, be able to throw in supplies by sea. This was about the middle of April 1689. The besieged were soon reduced to the most terrible extremities. Baker died on the 20th of June, and then the sole command devolved on Walker, who however showed himself quite equal to the emergency, directing and assisting in every operation, preserving the strictest discipline under the most difficult circumstances, and dividing himself between the most opposite duties, —now heading a sallying party, now reviving the hearts of soldiers and citizens by a rousing sermon in the cathedral. The end was, that the siege was at last raised, on the 30th of July, by Major-General Kirk making his way with three ships over a boom which James had thrown across the river. Walker soon after came over to England, and having published a narrative of the scenes in which he had been engaged, under the title of 'A True Account of the Siege of Londonderry;' in a quarto pamphlet, he received in November the thanks of the House of Commons for his heroic exertions. His account provoked some controversy: he defended himself against some of his assailants in a vindication published the same year; this was followed by an anonymous 'Apology for the Failures charged on the Rev. G. Walker's printed Account,' also 4to, 1689; and that by a 'Narrative of the Siege,' &c., by the Rev. John Mackenzie, 4to, 1690, professing to rectify Walker's mistakes, which was answered the same year by a friend of Walker, in another quarto pamphlet, entitled 'Mr. Walker's Mackenzie's Narrative a False Libel.' Meanwhile Walker, having been created D.D. by the University of Oxford, had been nominated by King William to the bishopric of Derry; but having resolved to serve another campaign before entering upon his episcopal duties, he was killed at the battle of the Boyne, on the 1st of July 1690.

There is in the British Museum a pamphlet of ten pages, entitled 'The Substance of a Discourse, being an Encouragement for Protestants, or a happy prospect of glorious success, &c., occasionally (sic) on the Protestants' victory over the French and Irish Papists before Londonderry, in raising that desperate Siege. By Dr. Walker, Minister, Governor of the City. London, printed by A. M. in the year 1689.' This was probably a reporter's publication. Prefixed on the title-page is a rude wood-cut, which seems to be intended to be taken for a portrait of Walker.

WALKER, REVEREND JOHN, is the author of a work entitled 'An Attempt towards recovering an Account of the Numbers and Sufferings of the Clergy of the Church of England, Heads of Colleges, Fellows, Scholars, &c., who were sequestered, harrassed, &c. in the late times of the Grand Rebellion; occasioned by the Ninth Chapter (now the Second Volume) of Dr. Calamy's Abridgement of the Life of Mr. Baxter: together with an examination of that Chapter,' folio, London, 1714. It contains a long list of subscribers, is dedicated to 'The Archbishops, Bishops, and Clergy, now assembled in Convocation,' and commences with a preface of above 50 pages, in which the author gives a very detailed account of his sources of information and the extensive researches he had made both in printed books and in public and private repositories. The body of the work consists of two parts, the first in 204 pp., the second in 436.

On his title-page the author designates himself 'M.A., Rector of St. Mary's the More in Exeter, and sometime Fellow of Exeter College, in Oxford.' In Watt's 'Bibliotheca' he is called 'Vicar of Ledbury, Herefordshire;' and elsewhere attributed to him, besides the above-mentioned work, two single Sermons, both published in 1710, and 'Conscience Displayed, in several Discourses on *Acts* xxiv. 16,' 8vo, 1729. But whether different writers be not confounded in this notice may be doubted. In Gorton's 'Biographical Dictionary' Walker is stated to have been a native of Devonshire, to have been, after the publication of his work on the Sufferings of the Clergy, complimented by the University of Oxford with the honorary degree of D.D., and to have died at Exeter in 1730. This information professes to be given on the authority of the 'Biographia Britannica;' but there is no account of Walker either in that work or in any of the other collections of English biography which we have had an opportunity of consulting.

Walker's 'Account of the Sufferings of the Clergy' has been severely attacked for its misstatements and exaggerations by Puritan and dissenting writers. It was replied to soon after its first appearance by Dr. Calamy, in a tract entitled 'The Church and Dissenters compared as to Persecution;' and also by the Rev. John Withers, a dissenting minister of Exeter. Several of its assertions were disputed by Neal, in various passages of his 'History of the Puritans;' and there is a general notice of the book in the preface to the third volume of that work, published in 1735, in which it is denounced as written "with notorious partiality, and in language not fit for the lips of a clergyman, a scholar, or a Christian." It must be admitted that Walker was a man of a coarse and violently prejudiced mind, without any critical judgment, and with little learning or ability of any kind: he boasts indeed of his unusual ignorance of the history of the time to which his work relates when he undertook its compilation, as rather a qualification for the task; and with all his parade of inquiry and preparation, it is evident that, partly from incompetency, partly from haste, he has set down many things upon very insufficient authority. His style is illiterate to the point of barbarism, and he complains pathetically of the laborious occupation he found writing for the press to be. Yet, after all deductions that may justly be made from the value of his book, it must be allowed to have preserved much curious information that in all probability would otherwise have been lost. Walker makes the entire number of the episcopal clergy who were "imprisoned, banished, and sent a starving," to have amounted to seven or eight thousand.

WALKER, JOHN, was born at Colney-Hatch, in the parish of Friern-Barnet, Middlesex, 18th March 1732, and was brought up to trade, but adopted the profession of an actor, which he followed with no great success till 1767, when he quitted the stage, and joined Mr. James Usher in establishing a school at Islington. This partnership lasted only about two years, after which Walker set up for himself as a teacher of elocution, and soon became greatly distinguished in that capacity. Not confining his instructions to the metropolis, he visited Scotland, Ireland, and various provincial towns, especially Oxford, where early in his career the heads of houses invited him to give a course of private lectures in the University. He soon also began to employ the aid of the press in disseminating what he considered to be correct views on the art which he professed. The settlement of the pronunciation of the English language upon analogical principles, and according to the best usage, was certainly attempted by Walker more systematically than by any preceding writer; and his various works, characterised as they all are by good sense and careful inquiry, as well as a respectable amount of information, cannot be denied to have done considerable service in that matter. His first publication was a prospectus of his Pronouncing Dictionary, under the title of 'A General Idea of a Pronouncing Dictionary of the English Language,' which he printed in quarto in 1772. This was followed in 1774 by 'A Dictionary of the English Language, answering at once the purposes of rhyming, spelling, and pronouncing;' afterwards reprinted, at least twice, under the title of 'A Rhyming Dictionary . . . . . in which the whole Language is arranged according to its Terminations,' &c. In 1781 appeared his 'Elements of Elocution,' which has gone through many editions. In 1783 he published a pamphlet, entitled 'Hints for Improvement in the Art of Reading.' The greater part of this tract he afterwards incorporated in his 'Rhetorical Grammar,' first published in 1785, and since often reprinted, as well as his 'Academic Speaker,' and two or three other similar compilations. In 1787 he published a small 8vo tract of 70 pages, entitled 'The Melody of Speaking delineated, or Elocution taught, like Music, by visible Signs;' which is not much known. His 'Critical Pronouncing Dictionary, and Expositor of the English Language,' the work which has occupied most of his attention, and upon which the reputation principally rests, first appeared in 1791. It has been eminently successful, having since gone through some thirty editions, and having superseded all other previous works of the same nature. Several of the later editions contain also his 'Key to the Classical Pronunciation of Greek, Latin, and Scriptural Proper Names,' which was first published a few years after the Dictionary, and of which there are also many editions in a separate form. His last publication was his 'Outlines of English Grammar,' which appeared in 1805. Mr. Walker, who was brought up a Presbyterian, but became a Roman Catholic, and a very strict one, in his latter days, died on the 1st of August 1807, and was buried among his co-religionists in Old St. Pancras church-yard, London.

WALKER, OBADIAH, was born at Worsbrough, near Barnesley, in the West Riding of Yorkshire, probably in the year 1616, and was educated at University College, Oxford, where he took his degree of M.A. in July 1635, and was chosen Fellow of his college in August following. In April 1638, he took his master's degree, and entered into holy orders. Becoming now very distinguished as a college tutor, he remained at Oxford till he was expelled from his fellowship by the parliamentary visitors in May 1648; on which he retired to Rome. On the Restoration he was reinstated in his fellowship; but he soon after paid another visit to Rome in the capacity of travelling tutor. Returning home in 1665, he might then have been elected master of his college, but declined the appointment. He accepted it however on the death of Dr. Richard Clayton in 1676.

Walker's tutors at Oxford had been Mr. Anderson and Mr. Abraham Woodhead, both of whom appear to have been then inclined towards popery, which Woodhead afterwards openly professed. Their instruction and his visits to Rome had probably made Walker a convert to the same faith long before his election to the mastership of University College. Although it is asserted by Anthony Wood that at the time of his appointment to this office he was actually assisting Woodward in his seminary at Hogsdon, or Hoxton, near London, in which young men were educated in the Romish religion. It was not however till 1678 that attention was drawn to his principles and conduct by the publication of his Latin translation of Sir John Spelman's Life of King Alfred, which appeared at Oxford in a magnificent folio in 1678. In October of this year, in the ferment excited by the death of Sir Edmundbury Godfrey, complaint was made in the House of Commons of the dangerous tendency of some of the notes to this work, and also of Walker's connection with the seminary at Hoxton. But no consequences followed; and, although the matter was mentioned again in April 1679, the master of University College remained still unmolested. At last, on the accession of James II. in 1685, Walker

Digitized by Google

openly declared himself a papist, and, after having paid a visit to London, during which he is understood to have been consulted by the king on the measures to be taken for restoring the old religion, he not only had mass celebrated in his lodgings, but converted two of the rooms of his college, forming the lower half of the side of the quadrangle next the chapel, into a Romish chapel, which he opened for public use on Sunday the 15th of August 1686. He at the same time obtained a mandate from the king to sequester the revenue of a fellowship towards the maintenance of his priest, and erected a statue of James over the inside of the college gate; and the next year he set up a press in the back part of his lodgings in the college, under letters-patent from his majesty, for the avowed purpose of printing books against the established religion. Many tracts, principally written by Woodward, issued in the course of the next few years from this press.

These rash proceedings of course made him a marked man when the Revolution came. He left Oxford on the 9th of November 1688; and on the 11th of December following, he, Andrew Fulton, a Jesuit, and others, put themselves into a coach at London, in the hope of making their escape to France; but hearing that the populace in Kent were seizing all papists that attempted to leave the kingdom, the party turned back. They were however pursued, seized, and carried first to Feversham, and thence to London, where Walker was committed to the Tower. On the 5th of February following, the vice-chancellor and doctors of the University declared him no longer master of University College; and on the 15th of the same month his place was filled up by the election of Edward Ferrer, the senior fellow.

On the 25th of October Walker was brought up by habeas corpus to Westminster Hall, and sued for bail; but he was immediately sent for, with other prisoners in the same circumstances, to the bar of the House of Commons; and the result of his examination there, in which he denied that he had ever stated his religion, the principles which he now professed being, he said, the same which had been taught him in his youth by his tutor Mr. Anderson, was that he was remanded to the Tower on a charge of treason. But on the 31st of January 1690, being again brought up to the court of King's Bench, he was allowed to give bail and was set at liberty; nor was he further troubled, although he was excepted out of the Act of Pardon soon after passed (the 2 Will. & Mar., sess. 1, c. 10). He spent the remainder of his days in retirement, and partly abroad; but he died at London, on the 21st of January 1693, in the house of Dr. Radcliffe, who was one of his old pupils, and by whom he had been some time principally supported. He was buried, at Radcliffe's expense, in old St. Pancras churchyard, the common place of interment of London Roman Catholics of the upper classes.

Walker, who is admitted on all hands to have been a man of learning and talent, is the author of various works, of which the principal are, 'A brief Account of Ancient Church Government,' Lond., 4to, 1662; a 12mo. tract, entitled 'Of Education, especially of Young Gentlemen,' first printed at Oxford in 1673, and for the fourth time in 1683; a Latin treatise on Logic, entitled 'Artis Rationis, maxima ex parte ad Mentem Nominalium, Libri Tres,' Oxford, 8vo, 1673; 'Some Instructions concerning the Art of Oratory,' 2nd edition, Oxford, 4to, 1682; 'An Historical Narration of the Life and Death of Our Saviour Jesus Christ,' Oxford, 4to, 1685 (the sale of which was prohibited by the vice-chancellor of the University, on the ground of the alleged popish tendency of some things in it); 'Some Instructions in the Art of Grammar,' Lon. 8vo, 1691; and 'The Greek and Roman History illustrated by Coins and Medals,' Lon., 8vo, 1692; a work which formerly had a high reputation.

WALKER, ROBERT, a clever English portrait-painter contemporary with Vandyck, and the principal painter employed by Cromwell. Walker painted several portraits of Cromwell, and those of most of his officers, military and naval. One of these portraits of Cromwell is now in the Pitti Palace at Florence. It was purchased by the reigning grand-duke in Cromwell's lifetime for 500*l.*: he sent a person to England for the express purpose of procuring a portrait of the Protector. The agent had much difficulty in procuring one to his satisfaction; but he at last found this by Walker, in the possession of a lady who was related to Cromwell, and who, being unwilling to sell the picture, in order to get rid of the importunity of the agent, asked him what appeared to her the exorbitant sum of 500*l.* for it. The amount was however immediately paid, she was obliged to part with her picture. A portrait by Walker of the Protector (half-length) in armour, and holding a truncheon in his hand, is in the British Museum; of this portrait Mr. J. Tollemache has a duplicate. Another was in the possession of Lord Mountford, at Horseth in Cambridgeshire, to whom it was given by Mr. Commissary Greaves, who found it at an inn in that county. There is a gold chain upon Cromwell's neck, to which is appended a gold medal with three crowns, the arms of Sweden, and a pearl: it was sent to him by Christina of Sweden in return for his picture by Cooper, on which Milton wrote a Latin epigram. Another was in the possession of the earl of Essex at Cashiobury; and another in Lord Bradford's collection, with the portrait of Lambert in the same piece.

"From one of R. Symonde's pocket-books," says Walpole, "in which he has set down many directions in painting that had been communicated to him by various artists, he mentions some from Walker, and says the latter received ten pounds for the portrait of Mr. Thomas Knight's wife to the knees; that she sat thrice to him, four or five hours at a time. That for two half-lengths of philosophers, which he drew from poor old men, he had ten pounds each in 1652; that he paid twenty-five pounds for the Venus putting on her Smock (by Titian), which was the king's, and valued it at sixty pounds, as he was told by Mrs. Boardman, who copied it, a paintress of whom I find no other mention; and that Walker copied Titian's famous Venus, which was purchased by the Spanish ambassador, and for which the king had been offered 2,500*l.* He adds, Walker cries up De Critz for the best painter in London."

Walker had for some time apartments in Arundel House: he died a little before the Restoration. There is a portrait of him by himself in the collection of Richard Gaywood, at Gunnister and finer at Hampton Court: there is also a good print of Walker, holding a drawing, by Lombart. Wadham College possesses a portrait of Blake—said to be the only portrait of the great admiral—by Walker. Walpole speaks of a half-length of General Monk at the countess of Montrath's, Twickenham Park, which he supposes to be by Walker: he mentions also by this painter a fine whole-length, sitting in a chair, of Keble, keeper of the great seal in 1660. Breckeridge says that Walker's works, by their life, best speak their own praises. The portrait of Cromwell in the Pitti Palace is painted in a masterly style: in the catalogue of that gallery this picture is attributed to Sir Peter Lely.

WALLACE, SIR WILLIAM. The life and exploits of this most popular national hero of the Scots have been principally preserved in a legendary form by poetry and tradition, and are only to a very small extent matter of contemporary record or illustrated by authentic documents. There is no extant Scottish chronicler of the age of Wallace. Fordun, the earliest of his countrymen from whom we have any account of him, is his junior by nearly a century. Wynton, the next authority, is still half a century later. His chief celebrator is the metrical writer Blind Harry, or Harry the Minstrel, whose work confesses itself by its very form to be quite as much a fiction as a history, and whose era at any rate is supposed to be nearly two centuries subsequent to that of his hero. Some few facts however may be got out of the English annalists Trivet and Hemingford, who were the contemporaries of Wallace.

There are contradictory statements of the year of his birth, but it is probable that he was born about 1270. His family was one of some distinction in Scotland, and he is said to have been the younger of the two sons of Sir Malcolm Wallace of Elderslie and Auchinbothie, in the neighbourhood of Paisley. His mother, who, according to one account was Sir Malcolm's second wife, is stated by the genealogists to have been Margaret, daughter of Sir Raynald or Reginald (other authorities say Sir Hugh) Crawford, who held the office of sheriff of Ayr.

The history of Wallace down to the year 1297 is entirely legendary, and only to be found in the rhymes of Harry the Minstrel; though many of the facts which Harry relates also still live as popular traditions. The names of the localities where the scenes of them are laid, whether handed down in that way from the time when they happened, or only derived from his poem, which long continued to be the chief literary favourite of the Scottish peasantry. Harry, who, it may be observed, professes to translate from a Latin account written by Wallace's intimate friend and chaplain, John Blair, makes him to have been carefully educated by his uncle, a wealthy churchman, who resided at Dunipace, in Stirlingshire, and to have been afterwards sent to the grammar-school of Dundee. Here his first memorable act is said to have been performed, his slaughter of the son of Selby, the English governor of the castle of Dundee, in chastisement of an insult offered him by the unwary young man: Wallace struck him dead with his dagger on the spot. This must have happened, if at all, in the year 1291, after Edward I. of England had obtained possession of all the places of strength throughout Scotland in his recognition as Lord Paramount by the various competitors for the crown, which had become vacant by the death of the infant Margaret, the Maiden of Norway, in September, 1290.

The bold deed committed by Wallace, who in making his escape is asserted to have laid several of young Selby's attendants as low as their master, was immediately followed by his outlawry. He now took to the woods, and gifted as he was with eloquence, sagacity, and other high mental powers and accomplishments (to this the testimony of Fordun as well as express and explicit as that of Harry the Minstrel), not less than with strength and height of frame and all other personal advantages, he soon found himself at the head of a band of attached as well as determined followers, who under his guidance often harassed the English soldiery, both on their marches and their stations, plundering and slaying, as it might chance, with equally little remorse. Particular spots in nearly every part of Scotland are still famous for some deed of Wallace and his fellow-outlaws performed at this period of his life; but for these we must refer to the Blind Minstrel. The mode in the neighbourhood of Ayr would seem to have been his chief haunt; and some of his most remarkable feats of valour were exhibited in that town, in the face and in defiance of the foreign garrison by which it was occupied. Both his father and his elder brother are said to have fallen in rencontres with the English during this interval. It was now also that he fell in love with the orphan daughter of Sir Hew de Bradfute, the heiress of Lamington, having, it

Digitized by Google

is said, first seen her at a church in the neighbourhood of Lanark. The Scotch writers affirm that this lady, whom he appears to have married, and who at any rate bore him a daughter, a year or two after forming her connection with Wallace fell into the hands of his enemies, and was barbarously executed by order of Haselrig, the English sheriff or governor of Lanark, while her husband, or lover, was doomed to witness the spectacle from a place where he lay in concealment. Such private injuries were well fitted to raise his public hatred to an unextinguishable flame.

How far the guerilla warfare maintained by Wallace and his associates contributed to excite and spread the spirit of resistance to the English government, we have scarcely the means of judging; but it seems probable that it acted materially in producing the general insurrection which broke out in the spring of 1297. The accounts we have of the commencement of that movement represent Wallace at its head, in command of a considerable force, and in association with some of the most distinguished persons in the kingdom, such as the Stewart of Scotland and his brother, Wishart, bishop of Glasgow, Sir William Douglas, &c. Soon after this he was joined by the younger Robert Bruce (afterwards King Robert I.), who had hitherto, as well as his father, still alive (the son of the original competitor for the crown), professed to adhere to the English king.

This however appears to have been but an ill-cemented confederacy. When the force despatched by Edward to quell the revolt presented itself before the Scottish army posted near Irvine, in Ayrshire, the leaders of the latter, throwing off the authority of their nominal chief, could no more agree what to do than whom to obey. The view that was that Bruce, the Stewart, Douglas, and others of them, availing themselves of the diplomatic talents of the bishop of Glasgow, concluded a treaty on the 9th of July, by which they agreed to acknowledge Edward as their sovereign lord, in the usual ultimatum of such treaties, to this arrangement, except only Wallace and his friend Sir Andrew Moray of Bothwell. The treaty of Irvine, which is printed by Rymer, is, we believe, the first of the few public documents in which mention is made of Wallace: to the instrument (which is in French) are subjoined the words, 'Escrit à Sir Williamur;' the meaning of which Lord Hailes conceives to be, "that the barons had notified to Wallace that they had made terms of accommodation for themselves and their party." The words moreover, on the supposition that they refer to Wallace, of which there seems to be little doubt, show that he had before this date obtained the honour of knighthood. He was probably been bestowed upon him (as was then customary) by some other knight, one of his companions in arms, since his elevation from being the captain of a band of outlaws to be the commander-in-chief of the national forces.

Wallace now retired to the north, carrying with him however a considerable body of adherents, to whom additional numbers rapidly gathered, so that he soon found himself in a condition to recommence aggressive operations. Directing his force on the north-eastern coast, he surprised the castle of Dunottar, cleared Aberdeen, Forfar, Brechin, and other towns of their English garrisons, and then laid siege to the castle of Dundee. While he was engaged in this last attempt, news was brought that the English army was approaching Stirling; upon which, leaving the siege to be carried on by the citizens of Dundee, he hastened to meet the enemy in the field. The result was the complete defeat and rout of the English at the battle of Stirling Bridge, fought on the 11th of September 1297—a battle which once more, for the moment, liberated Scotland. The English were immediately driven or fled from every place of strength in the country, including Berwick itself.

Availing himself of this panic, and of the exhilaration of his countrymen, Wallace pursued the fugitives across the border; and putting himself at the head of a numerous force, he entered England on the 18th of October, and remaining till the 11th of November, wasted the country with fire and sword from sea to sea, and as far south as to the walls of Newcastle. It was during this visitation that the prior and convent of Hexham obtained from him the protection preserved by Hemingford. It is dated at Heddleham (Hexham); the 7th of November, and runs in the names of "Andreas de Moravia, et Wilhelmus Wallensis, duces exercitus Scotiæ, nomine præclari principis Joannis, Dei gratia, Regis Scotiæ illustris, de consensu communitatis regni ejusdem," that is, "Andrew Moray and William Wallace, commanders-in-chief of the army of Scotland, in the name of King John, and by consent of the community of the said kingdom." The John here acknowledged as king of Scotland, was Baliol, now in the hands of Edward, and living in a sort of free custody in the Tower of London. Wallace associate in the command was the young Sir Andrew Moray, son of his faithful friend of that name who had retired with him from the capitulation of Irvine, and who had fallen at the battle of Stirling Bridge.

One of the most curious of the few public papers in which the name of Wallace occurs, was a few years since discovered by Dr. Lappenburg of Hamburg, in the archives of the ancient Hanseatic city of Lübeck. It is a letter, in Latin, addressed to the authorities of Lübeck and Hamburg, informing them that their merchants should now have free access to all the ports of the kingdom of Scotland, seeing that the said kingdom, by the favour of God, had been recovered by war from the power of the Englivh. The letter is dated 'apud Badsingtonam (the true word, it has been suggested, is probably Haddingtonam), the 11th of October, 1297, that is, a few days before the invasion of Cumberland and Northumberland. It is in the name of "Andreas de Moravia et Willelmus Wallensis, duces exercitus regni Scotiæ, et communitas eiusdem regni"—like the Hexham protection—but without any mention of King John: the letter is printed in the Appendix to 'The Life of Sir William Wallace, by John D. Carrick,' 8vo, London, 1840, p. 113.

After his triumphal return from his incursion into England, Wallace assumed the title of Guardian of the Kingdom in the name of King John, whether formally invested with that dignity or only hailed as such by the gratitude of his country. In a charter, printed in Anderson's 'Diplomata,' conferring the constabulary of Lanark on Alexander Skirmischur [Scrimgeour] and his heirs, and dated at Torphichen (in the county of Linlithgow) the 29th of March 1298, he styles himself "Willelmus Wallays miles, Custos Regni Scotiæ, et ductor exercituum ejusdem, nomine præclari principis Domini Johannis, Dei gratia Regis Scotiæ illustris, de consensu communitatis ejusdem." The grant is stated to have been made with the consent and approbation of the nobility ("per consensum et assensum magnatum dicti regni").

But this supreme elevation did not last long. Supported only by his own merits and the admiration and attachment of his humbler fellow-countrymen, Wallace, a new man, and without family connection, would probably have found it difficult or impossible to retain his high place, even if he had had nothing more to contend with than domestic jealousy and dissatisfaction. Fordun relates that many of the nobility were in the habit of saying, "It will not have a wise man to rule over us." Meanwhile the energetic English king, who had been abroad when the defeat of Stirling Bridge lost him Scotland, had now returned home, and was already on his march towards the borders, at the head of a powerful and well-equipped army. A body of English had landed in the north of Fife, led by Aymer de Valleis, earl of Pembroke, is said by the Scottish authorities to have been attacked and routed by Wallace on the 12th of June 1298, in the forest of Blackironside, in that county; but when the two main armies met on the 22nd of July, in the neighbourhood of Falkirk, the Scots commanded by Wallace, the English by their king in person—the former, after a gallant and obstinate resistance, were at last forced to give way, and the battle ended in a universal rout accompanied with immense slaughter.

This defeat did not put an end to the war; but it was taken advantage of by the Scottish nobility to deprive Wallace of his office of guardian or chief governor of the kingdom. The Scottish accounts say that he voluntarily resigned the supreme power; it is certain, at any rate, that Bruce, his rival Comyn, and Lamberton, bishop of St. Andrews, were now appointed guardians of Scotland as well, still in the name of Baliol. For some years after this our accounts of Wallace are slight and obscure; but he appears to have returned with a chosen band of followers to the practice of the desultory warfare in which he had originally distinguished himself. The legendary histories continue to detail his deeds of prowess performed in harassing the enemy both on their marches and in their camps and strongholds. And to fill up the story they also make him to have paid visits to France—the first in 1300, the second in 1302. The next well-ascertained fact regarding him is, that when the Scottish leaders were at last obliged to submit to Edward at Strathorde, on the 9th of February 1304, Wallace was not included in the capitulation, one of the clauses of which (printed in the original French in Ryley's 'Placita Parlamentaria'), is to the effect that as for Wallace (Monsieur Guillaume de Waleys), he might if he pleased give himself up to the king's mercy ("qu'il se mette en la volunté et en la grace nostre seigneur le Roy, si lui semble que bon soit"). He was soon after summoned to appear before a parliament, or convention of Scotch and English nobility, held at St Andrews; and upon their not presenting themselves, he and Sir Simon Frisel or Fraser were pronounced outlaws. For some time his retreat remained undiscovered, although his active hostility still continued occasionally to make itself felt. A principal person employed in the attempts to capture him appears to have been Ralph de Haliburton; but how he was actually taken is unknown. Sir John Menteith (a son of Walter Stewart, earl of Menteith), to whose treachery his delivery to the English king is attributed by Blind Harry and popular tradition, appears to have really done nothing more than forward him to England after he was brought a prisoner to Dumbarton Castle, of which Menteith was governor under a commission from Edward. Mr. Carrick, who has attempted to refute what is said upon this matter by Lord Hailes, has taken no notice of the further vindication of Sir John Menteith in Mr. Mark Napier's 'Memoirs of John Napier of Merchiston,' 4to, Edinburgh, 1834, pp. 527, &c., and in 'Tracts, Legal and Historical,' by J. Riddell, Esq., 8vo, Edinburgh, 1835, pp. 145-149.

On being brought to London, Wallace was lodged in the house of William Delect, a citizen, in Fenchurch-street; and on the next day, being the eve of St. Bartholomew, he was brought on horseback to Westminster, and in the hall there, "being placed on the south bench," says Stow, "crowned with laurel, for that he had said in times past that he ought to bear a crown in that hall," he was arraigned as a traitor, and on that charge found guilty, and condemned to death. After being dragged to the usual place of execution—the Elme in West Smithfield—at the talle of horses, he was there hanged on a high

Digitized by Google

gallows on the 23rd of August 1305, after which he was "drawn and quartered"—the usual punishment of persons convicted of treason. His right arm was set up at Newcastle, his left at Berwick, his right leg at Perth, his left at Aberdeen; his head on London Bridge. Wallace's daughter by the heiress of Lamington married Sir William Baillie of Hoprig, whose descendants through her inherited the estate of Lamington.

WALLACE, WILLIAM, a mathematician of eminence, was born on the 23rd of September 1768, at Dysart, in Fifeshire, N.B., in which town his father, a manufacturer of leather, had settled. He received the rudiments of education at a dame's school in his native town, and at seven years of age he was sent to a school in which, along with reading, he acquired the power of writing; but to his father he was indebted for instruction in arithmetic. In 1784 his father, after the failure of his business at Dysart, having gone with his family to reside at Edinburgh, he was placed with a bookbinder in that city, to whom soon afterwards he was bound as an apprentice. Without any encouragement from his master, the youth derived some advantage from the opportunities which occasionally presented themselves of perusing the books which he was employed to bind; and having besides found means to purchase some mathematical works, he succeeded in making himself master of their contents. It is said that before he was twenty years of age he had acquired a knowledge of elementary geometry and trigonometry, algebra with fluxions, conic sections, and astronomy.

About the same time he became acquainted with a man who was employed by Dr. Robison as an assistant in making the experiments by which the subjects of his lectures were exemplified; and when the term of his apprenticeship expired he accepted the offer of this person to instruct him to that distinguished professor. Dr. Robison, after an examination, that the young man had attained to considerable proficiency in mathematical science, and being made acquainted with his humble condition in life, kindly permitted him to attend the course of lectures on natural philosophy which was then about to commence, of which permission he thankfully availed himself. Dr. Robison soon afterwards proposed to him to give lessons in geometry to one of his own pupils; he also introduced him to Professor Playfair, who, taking an interest in his welfare, contributed both by advice and by loans of books to facilitate his progress in acquiring a knowledge of the higher branches of mathematics. In the hope of obtaining more time for the prosecution of his studies, Wallace accepted the situation of warehouseman in a printing-office; and while engaged in this employment he acquired, with the assistance of a student in the university, a knowledge of Latin, and soon afterwards he began the study of the French language. He subsequently became a shopman to one of the principal booksellers of Edinburgh, and while holding this situation he gave lessons occasionally in the evenings in mathematics.

In 1793 his increasing love for science, and a desire to have greater opportunities of cultivating it, led him to resign his employment and become a private teacher of mathematics; he however followed this occupation about a year only (during which time he attended the lectures of Professor Playfair and a course of lectures on chemistry), for in 1794 he was appointed assistant teacher of mathematics in the Academy at Perth. He married soon afterwards, and during the vacations he regularly visited Edinburgh, where his talents procured him an introduction to the distinguished scientific men of that city. Mr. Wallace continued to fulfil the duties of his appointment at Perth during nine years: but in 1803 he was appointed one of the mathematical masters in the Royal Military College, which had then recently been formed at Great Marlow, in Buckinghamshire. The institution was afterwards removed to Sandhurst, in Berkshire, and at both places he performed the duties of his post greatly to the satisfaction of the persons in authority. In 1818 it was determined that a half-yearly course of lectures on practical astronomy should be given for the benefit of the students, and that these should be combined with instruction on the manner of making celestial observations; for these purposes the plan of a small observatory was furnished by Dr. Robison, of Oxford, and Mr. Wallace, who was appointed to deliver the lectures, superintended the details of its construction. Such instruments were provided as suffice for the object proposed; and it may be said that the establishment of a course of astronomy at the college has contributed materially to the efficiency of military officers holding staff appointments abroad.

In the following year the death of Professor Playfair and the appointment of Mr. (Sir John) Leslie to succeed him in the chair of Natural Philosophy at Edinburgh, left a vacancy in the chair of Mathematics; and Mr. Wallace, whose highest ambition had always been to obtain a professorship in a Scottish university, immediately became a candidate for the post. He was elected, by a contest, by a majority of seven votes, and he held the appointment till 1838, when, on account of ill health, he resigned it. On this occasion the university conferred on him the honorary title of Doctor of Laws, and he received from government a pension in consideration of his attainments in science, as well as of his services in the Military College and at the University of Edinburgh.

Mr. Wallace died at Edinburgh, respected and regretted, on the 28th of April 1843, and consequently in the seventy-fifth year of his age, after an illness which for several years had prevented him from entering into society. He had been a Fellow of the Royal Astronomical Society from the time of its formation: he was also a Fellow of the Royal Society of Edinburgh, a corresponding member of the Institution of Civil Engineers, an honorary member of the Cambridge Philosophical Society, and a few weeks before his death he was elected an honorary member of the Royal Irish Academy.

In 1796 he presented to the Royal Society of Edinburgh his first paper, which was entitled 'Geometrical Porisms, with Examples of their Applications to the Solution of Problems;' it contains some new porismatic propositions, investigated according to the method of the ancient geometers, and affords proof of considerable inventive power. About this time the same time he contributed the article 'Porism' to the third edition of the 'Encyclopædia Britannica.' In 1802 he presented to the Royal Society of Edinburgh a paper containing a new method of expressing the co-efficients in the development of the formula which represents the mutual perturbation of two planets; and, in an appendix, he gave a quickly converging series for the rectification of an ellipse. In one point the subject of the paper had been previously investigated by Le Gendre, but the works of that great mathematician were then little known in this country, and apparently Mr. Wallace had not seen them. Six years afterwards he presented to the same society a third paper, entitled 'New Series for the Quadrature of the Conic Sections, and the Computation of Logarithms,' which contains some remarkable formulæ for the rectification of circular arcs and the sectors of equilateral hyperbolas, and for computing logarithms. In 1823 he presented a paper on the 'Investigation of Formulæ for finding the Logarithms of Trigonometrical Quantities from one another;' and in 1831 one entitled 'Account of the Invention of the Pantograph, and a description of the Eidograph,' the latter being an instrument which he had invented in 1821. In 1839 he gave a paper on the 'Analogous Properties of Elliptic and Hyperbolic Sectors;' and his last contribution to the society was one entitled 'Solution of a Functional Equation, with its Application to the Parallelogram of Forces, and the Curve of Equilibration;' this paper, which was published in vol. xiv. of the 'Transactions,' contains a table to ten decimal places of the values of the ordinates and arcs of a catenary. Mr. Wallace contributed to the 'Transactions of the Royal Astronomical Society' a paper entitled 'Two Elementary Solutions of Kepler's Problem by the Angular Calculus,' which is published in the volume for 1836; and in the sixth volume of the 'Transactions of the Cambridge Philosophical Society' there is a paper by him under the title of 'Geometrical Theorems and Formulæ, particularly applicable to some Geodetical Problems.' In 1838, while suffering from sickness, he composed a work on the same subject, which he dedicated to his friend Colonel Colby.

In his early life Mr. Wallace was a contributor to Leybourne's 'Mathematical Repository' and 'The Gentleman's Mathematical Companion;' he also wrote the principal mathematical articles for the 'Edinburgh Encyclopædia,' and for the fourth edition of the 'Encyclopædia Britannica.'

WALLENSTEIN, Albrecht Wenzel Eusebius, Duke of Mecklenburg, Friedland, and Sagan, count of Wallstein, commonly called Wallenstein, was the third son of Wilhelm, baron von Waldstein, and Margaret Smiricka, baroness Smiricz. He was born in his father's castle of Hermanic, in Bohemia, on the 15th of September 1583. The family of Waldstein, as the name indicates, is of German origin, and had belonged to the high nobility (Herrenstand) of Bohemia from the 13th century. In 1290 a knight or lord named Waldstein appeared at the court of King Ottokar of Bohemia, accompanied by his four-and-twenty sons, who, down to the youngest, bore coats of arms and the armour of knights.

From his earliest youth Albrecht von Waldstein showed a spirit of independence and haughtiness which often exposed him to the reproaches of his parents. He was only seven when, being chastised by his mother for a boyish fault, he cried out indignantly, "Why, am I not a prince? nobody should venture to flog me;" and his uncle having once reproached him with being as proud as a prince, he coolly answered, "Was nicht ist kann noch werden" (What is not may be yet). His delight was to be in the company of the military friends of his father, who died in the last his mother in 1593, and his father in 1595, although he was a younger son, he inherited considerable estates. The family of Waldstein belonged to the established Protestant church of Bohemia (the Utraquists); but this circumstance did not prevent Albrecht's uncle and guardian, Albrecht Slawata, lord of Chlum, a Roman Catholic, from putting his ward under the Jesuits at Olmütz, where he was to receive his education. The Jesuits soon succeeded in converting young Albrecht, an event which has been adorned with much fable. After having finished his education he set out for Italy, accompanied by Peter Verdugo, the brother of Kepler, a good mathematician and a famous astrologer. He continued his studies at Pavia and Bologna, where Argoli, the astronomer, taught him the principles of the Cabbala. Besides the Cabbala and astrology, Albrecht acquired a thorough knowledge of the ancient and almost all European languages; of the Roman, the canon, and the German law; and of mathematics and other sciences connected with the military art, which was always the chief object of his studies. Before he went to Italy he stayed some time in the University of Altdorf, where he signalised himself by many extravagances, if we may trust the stories

Digitized by Google

with which credulous contemporaries or later generations have disfigured the memory of the most lofty genius of his time. Argoli told him that he would be a great man. Wallenstein believed it. He always believed in astrology, and in later years the astrologer Seni was one of his principal counsellors.

Anxious to signalise himself by military deeds, Waldstein left Italy and went to Hungary, where the imperial armies were fighting against the Turks. At the siege of Gran he was amongst the foremost stormers, and his commander-in-chief, General Basta, appointed him captain on the walls of the conquered fortress. After the peace of Sitvatorok, in 1606, Waldstein returned to Bohemia, and married an aged but wealthy widow, Lucretia Nikessin, baroness of Landeck, who died in 1614, and left him fourteen large estates in Moravia. During his marriage, and till 1617 Waldstein devoted himself assiduously to the management of his estates; he proved an excellent farmer; he increased his wealth by economy; and he deposited large sums in the banking-houses of the Fugger and Welser, at Augsburg, who were then the richest merchants in Europe. In 1617 he raised a body of 200 dragoons, with which he assisted the Archduke Ferdinand of Austria, duke of Styria, who was at war with the Venetians; he saved the fortress of Gradisca, which was hard pressed by the Venetians; and by paying his soldiers well, and keeping open table, he became the idol of the Styrian army. In a short time he saw himself at the head of several thousand men, and after the campaign was finished, towards the end of 1617, to the advantage of the Archduke Ferdinand, the Emperor Matthias made him his chamberlain and colonel in his armies, and soon afterwards created him count. Immediately afterwards he married Isabella Catherine, the daughter of Count Harrach, who was the favourite of the emperor, who on this occasion conferred upon Waldstein the dignity of a count of the Holy Roman Empire. The states of Moravia appointed him commander of the Moravian militia; and at the outbreak of the war between the Bohemians and the emperor, the Bohemians offered him an independent command in their armies. The Protestant members of the family of Waldstein were partly among the anti-imperial or Bohemian party; but Albrecht, less from religious than from political motives, refused to make common cause with the Bohemians, in consequence of which the Moravian states deprived him of his command of the militia, and confiscated his estates. Waldstein saved the military chest of Moravia, a considerable sum, which he put into the hands of the trustees of the emperor, who, to reward him for his services, appointed him quartermaster-general of the imperial army, which, in concert with the troops of Maximilian, duke of Bavaria, was to take the field against Frederic V., count palatine, who had been chosen king by the Bohemians. The counts Mansfeld and Thurn having advanced as far as the neighbourhood of Vienna, and attacked the imperial general Bonquoi near Tein (10th of June 1619), Waldstein hastened to the assistance of Bouequoi, defeated the enemy, and thus saved the emperor from being made a captive in his own capital. In the battle on the Weisse Berg, near Prague (8th of November 1620), the cavalry of Waldstein distinguished themselves by their impetuous charges, but Waldstein was not present at the battle, being obliged by his commission as quartermaster-general to procure the necessary supplies for the imperial army. It seems that, the resources of the emperor being exhausted, Waldstein gave large sums for the support of his troops, for which loans he took out an ample indemnification. After the overthrow of King Frederic of Bohemia, the estates of his adherents were confiscated, and the greater part were either sold by the emperor Ferdinand II., or given as rewards to his faithful servants; on many occasions Waldstein was used to combine generosity and interest by selling them at a low price. The reward of Waldstein was the lordship of Friedland, worth about 600,000 gulden, for which he paid 150,000 gulden; and he bought more than sixty other lordships and estates, the value of which was estimated, at a very low rate, at 7,200,228 gulden, which however Waldstein only paid a part, his sacrifices and services being taken into account. As the value of money was then at least three times greater then it is now, the amount of the property acquired by Waldstein in consequence of his Bohemian war was at least 24,000,000 gulden (3,000,000*l.*) according to the present value of money, to which must be added the value of his personal estate.

Waldstein was neither intoxicated by his triumph nor by his wealth. In 1621 he took the field against Betlen Gabor, the prince of Transylvania, who stood on the frontiers of Germany, and who, after the effected a junction with John George, markgrave of Brandenburg-Jagerndorf, who was encamped near Jagerndorf, in the south-east corner of the then province of Silesia. Waldstein successively defeated both his adversaries, prevented their junction, and forced Betlen Gabor to sue for peace, which was granted on condition that he should give up his claim to the crown of Hungary, which he did. During the two ensuing years Waldstein was principally occupied with the management of his estates. But Betlen Gabor having again taken up arms against the emperor, Waldstein hastened to Hungary, and arrived just in time to save the imperial army under the Marquis of Caraffa, who was besieged in his camp at Going, on the frontiers of Moravia, by the prince of Transylvania, Count Thurn, and John George of Brandenburg-Jagerndorf. As a reward for his victory, the emperor, towards the close of 1623, conferred upon him the title of prince, and in the following year, 1624, created him duke of Friedland and prince of the Holy Roman Empire, an act which caused much jealoney among the other princes of the empire. In 1627 Wallenstein bought the sequestrated duchy of Sachan in Silesia for 150,800 gulden, which was a little more than one-fourth of its value; and although he had acquired it as a free estate, he preferred to take it as a fief from the emperor, who invested him with it in 1628.

The declaration of war of the Union of Lower Saxony, headed by Christian IV., king of Denmark, put the emperor into great embarrassment. His army was partly disbanded, and with his remaining troops he was unable to open the campaign, notwithstanding the assistance of the army of the Ligue, commanded by Tilly: his finances were exhausted. Waldstein offered to raise an army of 40,000 men. His proposal to raise this force with his own funds, but he said, when once in the field, the army would subsist and be paid by requiring those hostile provinces through which he should lead them. After long hesitation the emperor agreed to the proposition, and in two months Waldstein was at the head of 28,000 men with whom he marched towards the Lower Elbe. The renown of his military skill, his wealth, and his unbounded liberality towards the soldiers, was so great, that men flocked to his camp from all parts of Europe. Germans, Frenchmen, Irishmen, Scotchmen, Walloons, Croates, Poles, Hungarians, and Cossaks, formed an army of very heterogeneous elements, but the iron hand of their commander kneaded them into a well-united mass. His co-operation with Tilly, his victories over Mansfeld, his parallel march with this general towards Moravia, where Mansfeld and Betlen Gabor projected to join their armies, and the glorious result of this campaign, are parts of the imperialian history to the history of 'Thirty Years' War.' The campaign was begun and finished in 1626. Waldstein lost 20,000 men by disease and fatigue, but in the beginning of 1627 he was again at the head of 50,000 men. His second campaign from Silesia to Denmark, and his junction with Tilly on the Lower Elbe, likewise belong to the general history of the war. We shall only allude to the rapidity of his marches and the irresistible force of his advances. On the 1st of August 1627, he was at Troppeu, which he left for Sagan, where he stayed till the 19th for the purpose of making the necessary preparations for the memorable campaign which he was going to undertake. His army was incumbered by a heavy ordnance carried on clumsy carriages, by many woman and children, by a host of servants and groome of every description, and he had to cross a broad sandy tract where provisions were scarce, and where the country, in its natural state, was very little occupied by Danish garrisons. Yet once put in motion by the power of his genius, this heavy body advanced with irresistible rapidity. On the 21st of August Waldstein was at Cotthus; on the 27th at Havelberg; and on the 30th he took Domitz in Mecklenburg, after having performed a march of 250 miles in eight days, through a miserable country—a march which it would be difficult to perform for a modern army unincumbered by heavy ordnance and moving on excellent roads. On the 27th of September, his lieutenant, Count Schlick, defeated the Denes near Aalborg in Jutland, and Waldstein's cavalry and King Christian saved the remnant by flying to his ships and escaping to the Danish islands. Waldstein hastened to the Belt, and it is said that, being unable to cross this channel for want of ships, in a fit of anger he ordered the sea to be bombarded with red-hot bullets.

The Danish war was finished by the peace of Lübeck (12th of May 1629). Waldstein's reward were the duchies of Mecklenburg, with which he was invested by the emperor on the 16th of June 1629, after the Dukes Adolphus Frederick and John Albrecht had been dispossessed by the ban of the imperial diet in 1628. Waldstein choose Wismar, the best port for a navy on the southern coast of the Baltic, for his residence, and obtained from the emperor the title of Admiral of the Baltic and the Ocesnic Sea (the German Sea), for which ignorant historians have charged him with childish vanity. His object was to form a navy with the assistance of the Hanseatic towns, and to prevent Gustavus Adolphus, the king of Sweden, from choosing Germany for the theatre of his ambition. From the beginning of the Danish war Waldstein had penetrated the secret views of that king. "Bitt," wrote he to his lieutenant Arnim, "der Herr hat ein Aug auf sicht auf den Schweden, denn er ist ein gefahrlicher Gast" ("I beg you, sir, to observe well the Swede, for he is a dangerous fellow"). "Dem Gustav Adolph soll man keinen Glauben schonken, denn männiglich sagt dass er die Leute gern bei der Nase herumführt" ("You must not believe Gustavus Adolphus, for every man says that he likes to lead the people by the nose"). "Den Schweden will ich gern zum Freunde haben, aber dass er nicht zu mächtig ist, denn amor et dominium non patitur socium" ("I should wish to have the Swede for my friend, but that he should not be too strong, for love and power cannot agree"). At a moment when his funds were much exhausted, he ordered 35,000 dollars to be raised immediately, which he intended to give as a reward to a "certain merchant who was to do something in Sweden." It has been pretended that Waldstein had formed the plan of murdering Gustavus Adolphus, but there are no grounds for this accusation, and it appears that the merchant had proposed to burn the Swedish fleet in Karlskrona. The plan was not put into execution. During the siege of Stralsund, Waldstein cried out that he would have the town if it were fastened to the sky with iron chains; but he was compelled to abandon the siege.

No sooner was Waldstein invested with Mecklenburg, than his

Digitized by Google

numerous secret enemies changed their calumnies and intrigues into open accusations. The Duke of Bavaria, Maximilian, was Waldstein's declared enemy. By the extraordinary success of the imperial arms, the power and influence of the Ligue, of which Maximilian was the head, had become secondary. Tilly hated Waldstein as his greatest rival. The pride of the princes of the empire was hurt by the elevation of a general who, though a lord in Bohemia, was only a nobleman of lower rank with respect to the nobility of the empire, and yet had been raised to the dignity of duke of Mecklenburg; and they reproached him with dispossessing the former dukes of Mecklenburg of their estates, an act of injustice however for which the emperor was perhaps more blameable than Waldstein. The despotic character of Waldstein, the haughtiness with which he treated both friends and enemies, his rapacity in the provinces either conquered or merely occupied by him, and the greediness of his officers and soldiers, were the cause of many charges. Waldstein often endeavoured to stop the rapacity of his lieutenants, and he severely punished several Italian and Spanish officers, who in revenge called him 'il tiranno' (the tyrant). To this was added the aversion which Waldstein showed to all foreigners, especially Italians and Spaniards, who crowded to the court and the army; and his hatred of priests, and principally the Jesuits, who were powerful at the imperial court. Maximilian of Bavaria, at the head of all the enemies of Waldstein, declared to the emperor that he and all Germany would be ruined if the "dictator imperii" remained longer at the head of the imperial armies. Ferdinand, after long hesitation, dismissed Waldstein from his command in 1630, at the very moment when Gustavus Adolphus left the coast of Sweden for the invasion of Germany.

Waldstein, without making any complaints, retired to Bohemia, and resided alternately at Prague and at Gitschin. He lived with such splendour as to make the emperor himself jealous.

The invasion of Gustavus Adolphus, the defeat of the imperial armies at Leipzig, the conquest of Bavaria by the Swedes, and the death of Tilly, followed. The empire was on the brink of ruin, and there was only one man who could save it. This man was Waldstein. When the emperor requested and at last implored him to resume the command, he showed that he felt all his importance. Although he declined the proposition several times, he at last agreed to it on the following conditions: that Waldstein should have the sole control of the army, which he promised to raise; and there should be no imperial authority within his camp; no peace should be concluded without his consent; he, as duke of Mecklenburg, being one of the belligerent parties; he should have full power to manœuvre and to take up his quarters however and wherever he should find it convenient; that he should have the sovereignty of the provinces that he might conquer; and that the emperor should give him a reward one of his hereditary states (Bohemia?), of which he should be the sovereign, though as a vassal of the emperor.

The campaign of Waldstein against Gustavus Adolphus has been noticed in the article GUSTAVUS ADOLPHUS. It would be impossible for a knowledge of a consummate general to decide whether Waldstein or Gustavus was the greater captain. But from the moment that Waldstein resumed the command, he directed all its operations, and Gustavus Adolphus acted under the impressions which he received from the plans of Waldstein. Waldstein's defence of the lines of Nürnberg can only be compared with the defence of the lines of Torres Vedras by the Duke of Wellington. The march of the King of Sweden towards Bavaria, after his fruitless attempt on the lines near Nürnberg, was a great fault, although the King of Sweden soon received his error, and changed his plan by rapidly following Waldstein, this circumstance is another proof of what we have just said. It is true that Waldstein lost the battle of Lützen (6th November 1632), but able judges have given it as their opinion that on this occasion Waldstein showed his superiority to the king in the choice of the battle-field, while the king is said to have showed greater ability in the direction of his attacks. But the successful part of these attacks was the merit of Duke Bernhard of Saxe-Weimar, the king having fallen in the beginning of the battle, while engaged in rallying his troops, which were disorganised in consequence of those fruitless attacks which he directed.

As to the military conduct of Waldstein after the battle of Lützen, we shall only add that he punished with death many generals, colonels, and inferior officers who did not behave well in that battle. He soon repaired his losses, and his arms were victorious in Saxony and Silesia. But his haughtiness became insupportable, and he openly manifested his design to make himself a powerful member of the empire. This design had been sanctioned by the emperor, as already explained. The Jesuits and foreign generals at the court of the emperor availed themselves of the inactivity of Waldstein after the battle of Lützen to calumniate him to the emperor; and Waldstein having refused to relieve the Duke of Bavaria, preferring a campaign in Silesia, this prince, his old enemy, joined the secret enemies of Waldstein. They represented him as designing to overthrow Ferdinand's power in Germany, and the emperor was the more ready to believe the accusation, as it transpired that France had offered to Waldstein to aid him in obtaining the crown of Bohemia; but Waldstein rejected these propositions, and continued to show his earnest desire to drive all foreigners out of Germany, enemies as well as friends. The emperor ordered him to withdraw from Bohemia and Moravia, and to take up his winter-quarters in Lower Saxony (December 1633); but Waldstein neither would nor could obey this order, which he regarded as a violation of the conditions on which he had resumed the command. Upon this Maximilian of Bavaria urged the emperor to dismiss his disobedient general; and Waldstein, having been informed that the emperor had resolved to do it, declared that he would resign his command. His faithful lieutenants urged him not to abandon them, for they were all creditors of the emperor, who paid them very irregularly, and they were sure that they would never be paid at all if their commander should resign. In order to prove their invariable attachment, they signed a declaration at Pilsen, on the 12th of January 1634, in which they promised to stay with Waldstein as long as he should remain their commander. This famous declaration which has always been represented as a plot against the emperor. Piccolomini, Gallas, and several other Italian and Spanish officers availed themselves of the occasion to ruin Waldstein, whose wealth they were eager to divide among themselves; and the emperor, believing their misstatements, signed an order by which Waldstein was deprived of his command and declared a rebel (24th of January). Piccolomini and Gallas were commissioned to take Waldstein, dead or alive. The order was kept secret, but something transpired, and Waldstein, in order to prove his loyalty, ordered his lieutenants from their promise to stay with him till the last moment (20th of February). On the following day he sent two officers, Colonels Mohrwald and Breuner, to the emperor to declare in his name that he was ready to resign, and to justify his conduct; but Colonel Butler, an Irishman, treacherously informed Piccolomini of it, and the two officers were seized and not allowed to see the emperor, who was still deceived by the enemies of Waldstein. On the 20th of February the emperor ordered Waldstein's estates to be confiscated; and Pallas and Piccolomini again approached Pilsen for the purpose of surprising Waldstein. In this extremity Waldstein took refuge within the walls of Eger; and in order to save his life, sent Duke Frans Albrecht of Saxe-Lauenburg to Duke Bernhard of Weimar, requesting him to receive him with a small body of faithful officers and soldiers. Bernhard, as well as the Swedish chancellor Oxenstiern, declined the proposition, thinking that it was only a trick. During this time Waldstein remained in the castle of Eger. He was accompanied by his most faithful officers, among whom were Terzky, Kinsky, Illo, Neumann, and some traitors, such as Gordon, Butler, and Leslie, who were bribed by Piccolomini, and had promised to execute the bloody order of the emperor.

On the 25th of February, Gordon, who was commandant of Eger, gave a splendid entertainment to Waldstein's officers, at which the Duke and his guests present on account of his illness. Gordon an armed band rushed in, and the friends of Waldstein fell beneath their swords. Waldstein heard the cries of the murdered men. He opened a window and asked a sentinel what it meant. Suddenly Captain Devereux, at the head of thirty Irishmen, rushed into his apartment; and while his men shrunk back at the sight of their great commander, who stood before them defenceless and in his night-dress, Devereux advanced and cried out, "Art thou the traitor who is going to ruin the emperor?" With these words he lifted his partisan. Waldstein, disdaining a word, opened his arms and received the deadly blow in his breast. He was always thoughtful, and spoke little, and so he was in his last moment: he fell and died silently.

His wealth was partly divided among his enemies, each of whom received a large share, for the revenue of Waldstein was estimated at 3,000,000 gulden (375,000*l.*, or 1,125,000*l.* according to the present value of money.) Part of his estates were kept by the emperor, who paid for 3000 dead masses to be read for the soul of his great general.

Almost to the present time it has generally been believed that Waldstein had formed those treasonable schemes of which he was accused by his enemies; but the treason of Waldstein has never been proved. About forty years ago, Dr. Friedrich Foster from Berlin discovered many autograph letters of Waldstein in the family archives of the Count of Arnim, at Boitzenburg, in consequence of which discovery he was admitted, by order of the emperor Francis I., to the secret part of the archives of the military council at Vienna, which had hitherto not been used by the biographers of Waldstein and the writers on the Thirty Years' War. Foster found a considerable number of letters, which he published under the title 'Waldstein's Briefe,' 3 vols. 8vo, Berlin, 1828-29. Having been invited by the counts of Waldstein, who are descended from the brothers and uncles of Albrecht, to continue his researches, he was enabled to prove the complete innocence of Waldstein, and that he had fallen a victim to the intrigues of Piccolomini and his party. He published his results under the title 'Wallenstein, Herzog zu Mecklenburg, Friedland, und Sagan, als Feldherr und Landesfürst,' &c., 1 vol. 8vo, Potsdam, 1834.

WALLER, EDMUND, a celebrated English poet, was born on the 3rd of March, 1605, at Coleshill, in the county of Hertford. His father, Robert Waller, Esq., of Agmondesham, or Amersham, in Buckinghamshire, in which parish Coleshill is situated, represented a branch of an old Essex family, and had in early life followed the profession of the law. Edmund was the eldest of several sons and daughters, but he was still in his boyhood when his father died, leaving him an estate of 3500*l.* a-year. Waller's mother was Anne,

Digitized by Google

daughter of Griffith Hampden of Hampden in Buckinghamshire, and aunt of the patriot, who was consequently the poet's cousin. The relationship, if it is to be so called, of Edmund Waller to Cromwell, about which there has been some controversy or misconception, consisted in his uncle, William Hampden, the father of the patriot, having married Cromwell's aunt, Elizabeth; so that Hampden the patriot was first cousin both to the poet and to the protector. (Noble's 'Memoirs of the Protectoral House of Cromwell,' ii. 66-67, where however Waller's estate is erroneously set down at 35,000*l.* per annum, and his father is in one place called Richard, instead of Robert.)

Waller was educated at Eton, whence he proceeded to King's College, Cambridge. His earliest biographer, the writer of a memoir prefixed to the edition of his poems published in 1711, says that he obtained a seat in the House of Commons, at the age of sixteen, for the borough of Amersham. If so, he would appear to have been returned to the third parliament of James I., which met in January 1621, and to which that borough of Amersham claimed the right of sending representatives, after having ceased to do so ever since the second year of Edward II. The claim was eventually allowed; but it may be doubted if Waller, although he may have been elected, was permitted to take his seat, or at least was recognised as a member, although he may have sat sub silentio, as was then sometimes done. No members for Amersham, or for Wendover and Great Marlow, which were similarly circumstanced, are given in the common lists of this parliament. Whether Waller was returned to the next, James's fourth and last parliament, which met in February 1623, is not known; but it is probable that he was. In the first parliament of Charles I., which met in 1625, he was returned for Chipping-Wycombe. It is not certain that he sat in the next, which was called together in the following year; but he represented Amersham in Charles's third parliament, which sat from March 1627 to 1628, and also both in the short parliament of April 1640, and in the Long Parliament which assembled in November of the same year.

The earliest of Waller's poems is commonly assumed to have been produced towards the end of 1623, to celebrate an event which it celebrates happened, the escape of the prince (afterwards Charles I.) from being shipwrecked in the road of St. Andero, on his return from Spain. Yet it certainly was not published till some years later; and not only the title, 'On the danger His Majesty (being Prince) escaped,' &c., but even the verses themselves seem rather to imply that they were not composed at the time of the escape. Be this as it may, it is remarkable that the style and versification of this poem have quite as much neatness and finish as those of his latest days; so that, as has been said by one of his editors, as quoted by Johnson, 'were we to judge only by the wording, we could not know what was wrote at twenty and what at fourscore." Dryden has stated (in the preface to his 'Fables') that Waller himself attributed the polish and smoothness of his versification to his diligent study of Fairfax's translation of Tasso. Clarendon says expressly that "at the age when other men used to give over writing verses (for he was near thirty years when he first engaged himself in that exercise, at least that he was known to do so), he surprised the town with two or three pieces of that kind; as if a fourth Muse had been newly born, to cherish decaying poetry." In truth, there were only two or three of the poems that could have been written before his twenty-fifth year.

Some years before this date he had married Ann, daughter of Edward Banks, Esq., a very wealthy citizen of London, having gained the heart and hand of the lady against the interest of her friends, who exerted in favour of a rival suitor. By this match he considerably augmented his fortune. His wife, after bringing him a son, who died young, and a daughter, who when she grew up married Mr. Dormer of Oxfordshire, died in childbed, and "left him," as Johnson says, "a widower of about five and twenty, gay and wealthy, to please himself with another marriage." The older accounts make him to have lost his wife in 1629 or 1630.

It could hardly then have been, as is commonly represented, almost immediately or very soon after this that he began to pay his addresses to the Lady Dorothea Sidney, the eldest daughter of the Earl of Leicester, whom he has made famous in many of his love verses under the name of Sacharissa. The high-born beauty rejected his suit, and in 1639 married Henry, lord Spencer, who, in 1643, was created Earl of Sunderland, and was killed in September the same year, at the first battle of Newbury. As Lord Spencer at the time of his marriage was certainly not quite nineteen, it is not probable that his bride could have been old enough to be sought in marriage eight or nine years before. Sacharissa, who, after the death of her first husband, married Mr. Robert Smythe, survived till 1683. Another of Waller's temporary attachments at this period of his life was to the Lady Sophia Murray, whom he has celebrated under the poetical name of Amoret. At last, soon after the marriage of Sacharissa, but in what year is not precisely known, he married a Miss Mary Bresse, or Breaux, of whom nothing is recorded, except that she brought him thirteen children, five sons and eight daughters, and that she was, according to Aubrey, the antiquary, distinguished both by her beauty and her good sense.

When the government by parliaments was resumed, after an interruption of twelve years, in 1640, and Waller found himself again in the House of Commons, he joined the party in opposition to the court, where, although his fortune, wit, and poetical reputation had made him a distinguished figure, he is said to have been always looked upon with some suspicion as the near kinsman of Hampden. But his temper and position alike withheld him from going very far with the reformers or revolutionists; and on the approach of the crisis he seceded from his party, and seems to have withdrawn from the House. When the king set up his standard at Nottingham, in August, 1642, Waller sent him a thousand broad pieces; and, although he soon after returned to his place in parliament, he is supposed to have done so by his majesty's permission or direction. In the House he now spoke openly on the royal side—" with great sharpness and freedom," says Clarendon, "which, now there was no danger of being outvoted, was not restrained; and therefore spoke as an argument against those who were gone upon pretence that they were not suffered to deliver their opinion freely in the House; which could not be believed, when all men knew what liberty Mr. Waller took, and spoke every day with impunity against the sense and proceedings of the House."

Waller was one of the commissioners sent by the parliament to the king at Oxford, after the battle of Edgehill, in January 1643; and it was soon after this, in the end of May, that the design known as Waller's plot was discovered. It is difficult to say what was really the object of the so-called plot or conspiracy. The parliament denounced it as "a popish and traitorous plot for the subversion of the true Protestant religion and liberty of the subject," &c.; and May, in his 'History of the Parliament,' gives a minute account of the plans of the conspirators for taking into their own hands all the powers of government, and executing the whole plan of the parliamentary party. On the other hand it is alleged that Waller and his friends had really no further object than to ascertain the state of opinion in the city of London, by making lists of the inhabitants, and dividing them into regiments, parliamentarians and royalists, ready to oppose the excesses of either faction. There can be little doubt however that this is very much of an under-statement. Yet it may be questioned if Waller's design really had anything to do with another which was detected about the same time—a project of a loyal London merchant, Sir Nicholas Crispe, to raise an armed force, on a fit opportunity should occur, to act against the parliament, for which purpose he had obtained a commission of array from the king. Waller's chief confederate was his sister's husband, Mr. Tomkyns, who held the office of clerk of the queen's council, and had extensive connexions and influence in the city; and their proceedings were discovered, according to one account, by a servant of Tomkyns, who, while lurking behind the hangings, overheard a conference between his master and Waller; according to another version of the story, by a sister of Waller, who was married to a Mr. Price, a great parliamentarian, and a chaplain Goode, who stole some of his papers. The commission of array granted to Crispe was found in the possession of Tomkyns; but this is explained as having happened through an accident, and Waller always denied that he knew anything of Crispe's scheme. In other respects his confessions were ample enough. "Waller," says Clarendon, "was so confounded with fear, that he confessed whatever he had heard, said, thought, or seen; all that he knew of himself, and all that he suspected of others, without concealing any person, of what degree or quality soever, or any discourse which he could ever upon any occasion entertained with them." Various ladies of rank, to whose intimacy he had been admitted, were implicated by his lavish revelations. In the end Tomkyns, and another person named Challoner, who were charged with having had a commission to raise money for the king, were hanged at their own doors: Tomkyns in Holborn; Challoner in Cornhill. Alexander Hampden, another relation of Waller's, was kept in prison till he died; and some others had their estates confiscated, or were long detained in confinement. Others made their escape to the king at Oxford. As for Waller, undoubtedly the prime contriver of the design, whatever it amounted to, his life was saved, but the facts connected with his deliverance are variously related. In the Life prefixed to his Works it is expressly asserted that he was arraigned at Guildhall along with Tomkyns and the rest, and condemned to death. Lord Clarendon, on the contrary, states that "Waller, though confessedly the most guilty, with incredible dissimulation affected such a remorse of conscience, that his trial was put off, out of Christian compassion, till he might recover his understanding." After he appeared to be in a more composed state, he was brought to the bar of the House of Commons, on the 4th of July, and there delivered a speech, which is printed in his Works, and which certainly indicates nothing like insanity, but is perhaps without a parallel for humility and baseness of spirit. He began by begging that he might not be exposed to a trial by a council of war, and Clarendon says that he prevailed in that request, and thereby saved his "dear-bought life;" but, according to Whitelocke, he was actually made over to the tribunal he so much dreaded, and being tried and condemned, was reprieved by Essex. He lay in prison a year, and was then set at liberty on the understanding that he should leave the country. Of his property, all that was exacted from him was a fine of 10,000*l.*; but it is affirmed by his first biographer, that he expended three times that sum besides in bribes. Altogether, we are informed, he was obliged to sell estates to the value of 1,000*l.* per annum on this occasion.

On his release, Waller retired to France, and took up his residence first at Rohan, afterwards in Paris, where, we are told, he lived in

Digitized by Google

great splendour. We are led to suppose that he was allowed to draw the rental of so much of his large estates as he had not been obliged to sell; but according to the 'Biographia Britannica,' "the chief support of this magnificent way of life was derived from his wife's jewels, which he had taken away with him;" and then we are told that, after ten years thus spent, he found himself reduced to what he called the Rump jewel. It was during his exile that, in 1645 (not 1640, as misprinted in the 'Biographia Britannica'), he published in 8vo. the first collection of his poetry, under the title of 'Poems, &c., written by Mr. Edmund Waller, of Beaconsfield, Esq., lately a member of the Honourable House of Commons.' At last, apparently about 1653, through the interest of Colonel Scrope, who was married to one of his sisters, he obtained Cromwell's permission to return to England: and came over and established himself at Hall Barn (Johnson calls it Hallibarg), a house he had built near Beaconsfield. Although his mother, who lived at Beaconsfield, and often, it is said, entertained the Protector in her house, continued a professed royalist, Waller soon insinuated himself into great familiarity and favour with Cromwell, to whom in 1654 he addressed one of the most elaborate and successful of his poetical performances, under the title of 'A Panegyric to my Lord Protector, of the present greatness and joint interest of his Highness and this Nation.' In a similar strain he afterwards took occasion, in celebrating Blake's victory over the Spanish fleet, in September 1656, to recommend to Cromwell the assumption of the name, as well as the power of a king. The next of his poems is still in the same vein, 'On the Death of the Lord Protector;' but this is immediately followed in the collection by one 'To the King, upon his Majesty's happy Return,' which, if not as animated as his poem to Cromwell, is at least as full of loyal protestations; however it enabled Waller to his former position more completely than his recall by Cromwell had done. He now became once more a first figure both at court and in the state. It does not appear that he sat in what is called the Convention Parliament, which brought the king back; but to the next, or Charles's Long Parliament, which met in March 1661, and continued in existence till 1679, he was returned for Hastings; in the next, which met in March 1679, he sat for Chipping-Wycombe; he does not appear to have been a member of Charles's fourth parliament, which met in October 1680, or of his fifth and last, which met in March 1681; but to the first and only parliament of James II., which met on his accession in May 1685, the octogenarian poet was returned as one of the members for Saltash; and, as appears from the 'Parliamentary History,' he continued to be so, to take a not inactive part in the debates. Burnet, in his 'History of his Own Times,' says, under the year 1675, "Waller was the delight of the House; and even at eighty he said the liveliest things of any among them: he was only concerned to say that which should take to be applauded. He was never laid the business of the House to heart, being a vain and empty though a witty man."

In 1665 Waller asked and obtained from King Charles the provostship of Eton College; but Clarendon refused to put the seal to the grant, on the ground that the office could be held only by a clergyman. This incident is supposed to have instigated the vindictive poet to take a keen part in the proceedings of Buckingham and his faction, which brought about the destruction of the chancellor. After Clarendon's banishment, the provostship became vacant, and Waller again asked it again of the king; upon which his majesty referred the petition to the council, before whom the question was argued by counsel for three days, and was finally determined as before.

One of Waller's latest poetical performances was a copy of verses entitled 'A Presage of the Ruin of the Turkish Empire,' which he presented to James II. on his birthday (in what year is not stated). He was treated by James with kindness and familiarity; but does not appear to have shown any disposition to go along with him in his illegal measures. He did not live to witness the Revolution; he died at Beaconsfield, on the 21st of October 1687. It is noted that his heir joined the Prince of Orange.

Of the children he had by his second wife, the eldest son, Benjamin, we are told in the 'Biographia Britannica,' was "so far from inheriting his father's wit, that he had not a common portion, and therefore was sent to New Jersey in America." He left his estate to his second son Edmund, who repeatedly represented Amersham in parliament, attaching himself in the House to the neutral party called the Flying Squadron, was esteemed in his society "a very honest gentleman and a man of good sense," was not "without a taste in poetry," and ended by becoming a Quaker in his latter days. His third son, William, was a merchant in London; the fourth, Dr. Stephen Waller, became an eminent civilian; of the fifth nothing is known.

The merits of Waller as a poet have been elaborately discussed by Johnson. He will scarcely be now admitted to have been even in his own day what he is called by the writer of his life in the 'Biographia Britannica,' "the most celebrated lyric poet that England has ever produced;" unless perhaps we are to consider a lyric poet as meaning a poet who has written nothing but lyrics, and then the title would not be applicable to Waller. He was certainly, in so far as respects diction and versification, the most correct poetical writer that we had before Pope; and it cannot be questioned that his example had considerable effect in regulating the form and refining the manner of our poetry, although it may also have helped somewhat to tame its spirit. Yet, although there is not much glow of imagination in Waller, there is often a great deal more than mere prettiness or even elegance; his more serious pieces have frequently much dignity and elevation of thought, as well as of expression. And generally his language has the high merit of being a lucid mirror and exponent of his meaning, giving out with perfect distinctness at least the lines and formal features of the idea, however deficient it may be in the power of reflecting coloured light, or rather, however little of that there may be for it to reflect.

WALLER, SIR WILLIAM, a distinguished military commander on the side of the parliament in the civil wars of the 17th century, was of the same family of the Wallers of Spendhurst in Kent, from which the poet Waller was descended, and was born in 1597. After pursuing his studies for a time at Magdalen Hall and Hart Hall, Oxford, he went to complete his education at Paris; and while abroad he entered the service of the confederated powers (Sweden, Holland, and the Protestant princes of Germany) in the war which they carried on against the emperor after their league of the year 1626. On his return home he received from Charles I. the honour of knighthood. In 1640 Sir William Waller was returned to the Long Parliament for Andover; and he immediately took his place among the opponents of the court. His foreign education and service had given him a strong attachment to Presbyterianism; and he had also, it is said, smarted under the severities of the Star-chamber. On recourse being had to arms, Sir William was appointed one of the parliamentary generals, and he greatly distinguished himself on various occasions, especially in the reduction of Portsmouth in September 1642. He was however defeated at Lansdown near Bath, on the 5th of July 1643; at Roundway Down near Devizes, by Lord Wilmot, on the 13th of the same month; and at the same place again on the 8th of September. On the 29th of March 1644, Waller defeated Lord Hopeton at Cherryton Down near Winchester; but on the 29th of June following he was in turn worsted by the royal forces at Cropredy-bridge in Oxfordshire. Some of these reverses which Waller sustained gave rise to warm counter-accusations between him and Essex; he charging the commander-in-chief with wishing to sacrifice him; Essex retorting upon Waller with reproaches of want both of conduct and courage. Waller however was throughout stoutly supported by his party, the Presbyterians. The self-denying ordinance (passed April 3rd, 1645), deprived Waller of his command; but he continued to be looked upon as one of the leaders of the Presbyterian party in the House of Commons till the impeachment of the eleven members, of whom he was one, by the army (June 23rd, 1647), when he withdrew with the rest from the House. He returned however after a time, and continued to attend until he was driven out by force, along with all the other members of his party, by Colonel Pride, on the 6th of December 1648. From this time we hear no more of him till after the death of Cromwell, when, in August 1659, he was taken up on the charge of being engaged in the Cheshire insurrection, headed by Sir George Booth, and was detained in custody till November following, when he was released on bail. He probably resumed his seat in the House of Commons, with the other excluded members, in February 1660; and he was nominated one of the Council of State constituted by the House on the 25th of that month. To the Convention Parliament, which met in April, he was returned as one of the members for Lymington; but does not appear to have sat in any subsequent parliament. He died at Osterley Park in Middlesex, on the 19th of September 1668. He had been three times married; and from his daughter Margaret, by his first wife, daughter and heiress of Sir Richard Keynell of Ford, in Devonshire, who married Sir William Courtenay of Powderham Castle, descended the present Earl of Devon; from his daughter Anne, by his second wife, the Lady Anne Finch, daughter of the first Earl of Winchelsea, who married Sir Philip Harcourt, was descended the late Earl Harcourt.

Sir William Waller is the author of a work entitled 'Divine Meditations upon several Occasions; with a Daily Directory,' which was printed in an octavo volume at London in 1650; and also of a 'Vindication' of his own character and conduct, which was first published from the manuscript, in 8vo, with an introduction by the editor, at London in 1793. Both these works give a favourable impression of his honesty and ingenuousness, as well as of his shrewdness and ability.

WALLICH, NATHANIEL, M.D. [*See* vol. VI. col. 1029.]

WALLIN, JOHANN OLOF, an eminent Swedish poet and preacher, was born in Dalecarlia on the 15th of October 1779, studied at the university of Upsal, and took holy orders in 1806. He was known as a poet before he became a clergyman, and received three times the prize of a golden medal from the Swedish Academy, but his productions were rather distinguished for fluency and elegance of language than for poetical fervour, and he did not discover the vein in which he was destined to achieve a great celebrity till the cultivation of it became a kind of professional task. In 1811 a committee was appointed to revise and augment the Swedish Psalm and Hymn Book, and Wallin, who in the preceding year had been elected "One of the Eighteen" of the Swedish Academy, was appointed one of the members. He disagreed with the majority of his colleagues with respect to retaining some of the old hymns, which they considered too homely, and finally published a separate collection, in which several of these old hymns were freed from everything objectionable, by trifling alterations of language, and several new ones of Wallin's own were added, which

Digitized by Google

are universally admitted to display a genius for that class of composition of a rare order. As in the case of our own Dr. Watts, the poet's other verses may be said to be forgotten, while his hymns are the delight of thousands. They have been adopted in the authorised Swedish Psalm and Hymn-Book, of which they form the principal ornament, though several other contributions from modern poets have assisted to raise the collection to the rank which it now takes of one of the best in Europe. Wallin, who in 1812, began to occupy a pulpit in Stockholm, soon became a popular preacher and was selected to impart theological instruction to Prince Oscar, afterwards king of Sweden. After filling various ecclesiastical dignities, he was appointed in 1833 archbishop of Upsal, the highest post in the Swedish church. He died on the 30th of June 1839, universally respected and admired. Three volumes of 'Religiösa Discurser' on various themes, and 'Religions-Tal vid utskillinga Tillfällen' (Stockholm 1827-31), and three of sermons, 'Predikningar,' published after his death, are unsurpassed in Swedish literature as specimens of pulpit eloquence. His literary works 'Witterhets Arbeten,' were published in two volumes at Stockholm in 1848.

WALLIS, JOHN, was the eldest son of the Rev. John Wallis, incumbent of Ashford in Kent, where he was born November 23, 1616. The life of this eminent mathematician is very fully given in the 'Biographia Britannica,' which is our sole authority for the facts now to be stated respecting him.

The father of Wallis died when he was six years old, leaving five children to the care of his widow. As he died wealthy, his eldest son was brought up with great care and intended for a learned profession. In that day mathematical studies were rarely a preparatory to higher kind of pursuits; in the case of Wallis, even common arithmetic seems to have been neglected. He was fifteen years old when his curiosity was excited by seeing a book of arithmetic in the hands of his younger brother, who was preparing for school. On his showing some curiosity to know what it meant, his brother went through the rules with him, and in a fortnight he had mastered the whole. At the age of sixteen, which was rather late at that time, he was entered at Emmanuel College in Cambridge, where he soon obtained reputation. Among his other studies, anatomy forms a place; and he is said to have been the first student who maintained, in a public disputation, the doctrine of the circulation of the blood, which had been promulgated by Harvey four or five years before. There were no mathematical studies at that time in Cambridge, and none to give even as much as advice what books to read: the best mathematicians were in London, and the science was esteemed no better than mechanical. This account is confirmed by his contemporary Horrocks, who was also of Emmanuel, and whose works Wallis afterwards edited. After taking the degree of master of arts, the county of Kent not being remote in his own estimation, he chosen fellow of Queen's, and took orders, in 1640. He was then chaplain in one and another private family, residing partly in London, till the breaking out of the civil war, in which he took the side of the Parliament. He made himself useful to that party by deciphering the intercepted letters, an art in which he was eminent. Vieta, as he have seen [VIETA, FRANCIS, vol. vi. col. 361.], had deciphered, and Baptista Porta had written something on the subject, but only with reference to simple ciphers. In 1643, the sequestered living of St. Gabriel, Fenchurch Street, was given to him; and in the same year he published 'Truth Tried, or Animadversions on the Lord Brooke's Treatise on the Nature of Truth.' In this year also he came into a handsome fortune by the death of his mother. In 1644 he was appointed one of the secretaries of the Assembly of Divines at Westminster. He has given a succinct account of the proceedings of this body. (See the 'Biographia Britannica.') In this year also he married. In 1645 he was among the first who joined those meetings which afterwards gave rise to the Royal Society: but we do not hear of any particular attention to mathematics on his part till 1647, when he met with Oughtred's 'Clavis,' at which time he says he was a very young algebraist, being then more than thirty years old. He and James Bernoulli are alike in this, and differ from most others of the same celebrity, that they showed no strong tendency to mathematical pursuits at a very early age. When the Independents began to prevail, Wallis joined with others of the clergy in opposing them; and in 1648 subscribed a remonstrance against the execution of Charles I. He was then rector of St. Martin's Church in Ironmonger Lane, but in 1649 he was appointed Savilian professor of geometry at Oxford by the Parliamentary visitors, his predecessor, Dr. Turner, having been ejected. He now removed to Oxford, and applied himself diligently to mathematics. In 1650 appeared his 'Animadversions' on the celebrated Richard Baxter's 'Aphorisms of Justification and the Covenant,' a moderate piece of theological controversy, undertaken, Wood supposes, at the desire of Baxter himself. At the end of 1650 he first met with the method of indivisibles in the writings of Torricelli, and from this time the researches begin, of which we shall presently have to speak. In 1653 he published, in Latin, an English grammar for the use of foreigners, with a treatise on the formation of articulate sounds prefixed. In the same year he deposited in the Bodleian Library a collection of deciphered letters, which afterwards caused some controversy. In 1654 he took the degree of doctor of divinity, and in the following year he published his 'Arithmetica Infinitorum,' with a treatise on Conic Sections prefixed. In 1655 he began his controversy with Hobbes, who, in his 'Elementorum Philosophiæ Sectio Prima,' had given a quadrature of the circle. Wallis answered this in a tract entitled 'Elenchus Geometriæ Hobbianæ.' Hobbes replied in 'Six Lessons to the Professor of Mathematics at Oxford:' on which Wallis published 'Due Correctori for Mr. Hobbes, or School Discipline for not saying his Lesson right,' Oxford, 1656. Hobbes defended himself in Κριτικὸς, or 'The Marks of the absurd Geometry, &c. of Dr. Wallis,' London, 1657. Wallis answered in 'Hobbiani Puncti Dispunctio, in answer to Mr. Hobbes's Κριτικὸς,' Oxford, 1657. The controversy was renewed by Mr. Hobbes in 1661, in 'Examinatio et Emendatio Mathematicorum hodiernorum,' to which Wallis replied in 'Hobbius Heautontimorumenos,' Oxford, 1663. Wallis, as may be supposed, had the right on his side; and we are disposed to regret that he did not allow his part of the controversy to appear in the collection of his works, though we admit but respect the motive, namely, the desire not to attack an opponent after his death. In 1656 he published his treatise on the angle of contact, and a defense of it in 1685.

In 1657 Wallis published his 'Mathesis Universalis,' and in 1658 appeared, under the title of 'Commercium Epistolicum,' a correspondence arising out of a problem proposed to him by Fermat: also a sermon, 'Mens sobria serio commendata,' and a commentary on the Epistle to Titus. In 1658 the questions of Pascal on the cycloid appeared, which were answered by Wallis, and led to a controversy. About this time Wallis, who with others desired the restoration of the kingly power, employed his art of deciphering on the side of the Royalists; so that at the Restoration he was received with favour by Charles II., confirmed in his professorship and in the post of keeper of the archives at Oxford, and was made one of the royal chaplains. In 1661 he was one of the clergy appointed to review the Book of Common Prayer. He was of course one of the first members of the Royal Society, and from this to his death his life is little more than the list of his works. His tract on the Cuneo-cuneus, or circular wedge, was published in 1663; his tract 'De Proportionibus,' and his treatise on the laws of collision, in the same year: his new hypothesis on the tides, 'De Æstu Maris,' in 1668; and the treatise on mechanics at different times, in 1669, 1670, and 1671. In 1673 he edited the works of Horrocks; the Arenarius and quadrature of Archimedes appeared in 1676; his edition of Ptolemy's Harmonics (to which other ancient musicians were afterwards added) in 1680. His algebra appeared in English in 1685, and was translated into Latin with additions in the collection of his works; in the same year also, his treatise on Angular Sections and on the Cuneo-cuneus. In 1685 he wrote theological pieces on Melchisedec, Job, and the titles of the Psalms. In 1687 appeared his celebrated work on logic. In 1688 he edited Aristarchus and fragments of Pappus. In 1691 he published his pieces on the Trinity, and those on the baptism of Infants; and, in 1692, on the use of the Christian sabbath against the Sabbatarians, or observers of Saturday. The collection of his works by the curators of the University press began to be made in 1692; the three volumes bear the disordered dates of 1693, 1693, and 1695. In 1692 he was consulted on the adoption of the Gregorian calendar, or new style, against which he gave a strong opinion, and the design was abandoned. In 1696, when the first two volumes of his works appeared, he was the remote occasion of beginning the controversy between the followers of Newton and Leibnitz. Some remarks which he made on his notions on the origin of the differential calculus in the Leipsic Acts, which produced a correspondence, and this correspondence was published in the third volume. He died October 28, 1703, in his 88th year.

The character of Wallis as a mathematician rested upon one occasion only, in which it was asserted that he had deciphered the king's letters after the battle of Naseby, to the great detriment of the royal cause and its followers. It was also said that the collection of deciphered letters which he gave to the University had some of its contents withdrawn by him when the Restoration was approaching. Wallis himself denied that he had deciphered the king's letters on that occasion, though had he done so, it would, granting his adherence to the parliament to be justifiable, have been no more than his duty. A sort of repugnance exists to a decipherer, though common sense tells us that those who intercept and open an enemy's letter which, being written in common language, is in some sort confided to those into whose hands it may fall, are much more obnoxious to any charge than the decipherer of a letter which, being written in cipher, more resembles a defiance.

All that can be said against Wallis, if it amounts to anything, is just this, that when he desired the downfall of the kingly power, he used his talents against the king, and then, when, at another time and under very different circumstances, he wanted the restoration, he used his talents for it. And as to the charge of withdrawing the letters from the Bodleian, it ought to have been added, that when he presented them, it was with a written reservation to add or withdraw. The best testimony to the general character of Wallis is as follows:—He was exceedingly obnoxious to the high church party at Oxford, both from his low church principles, and from his having been forced upon the University by external and democratic power. But all that his contemporary Wood, who will not admit him into the 'Athenæ Oxonienses' as an Oxford writer, can say or hint against him, amounts to as much as we have mentioned. And yet there was no want of disposition to disparage a presbyterian in Wood, as witness the follow-

Digitized by Google

ing liberal sentiment: "The senior proctor, according to his usual perfidy (which he frequently used in his office, *for he was born and bred a Presbyterian*), did pronounce," &c. &c. ('Ath. Oxon.,' ii. 1045.)

Wallis, in his literary character, is to be considered as a theologian, a scholar, and a mathematician. As a divine, he would probably not have been remembered, but for his eminence in the other characters. His discourses on the Trinity are still quoted in the histories of opinions on that subject. At the time of South and Sherlock, much was written on the Athanasian Creed which was meant to be of an explanatory character: those who read South and Sherlock on the Trinity, may also read Wallis, who will be found inferior to neither; but many have considered him scarcely orthodox. If the character of Wallis has been elevated as a divine by his celebrity as a philosopher, his services as a scholar have for the same reason been, if not underrated, at least thrown into shade. He was the first editor of Ptolemy's Harmonics, of the commentary on it by Porphyrius, and of the later work of Briennius; as also of Aristarchus of Samos. His editions contain collateral information of the most valuable character, tending to throw light upon his author, and exhibit an immense quantity of labour.

As a mathematician Wallis is the most immediate predecessor of Newton, both in the time at which he lived and the subjects on which he worked. Those who incline to the opinion that scientific discoveries are not the work of the man, but of the man and the hour, that is, who regard each particular conquest as the necessary consequence of the actual state of things, and as certain to come from one quarter or another when the time arrives, will probably say that if Wallis had not lived, Newton would but have filled his place, as far as the pure mathematics are concerned. By far the most important of his writings is the 'Arithmetica Infinitorum,' a slight account of which we shall preface by some mention of the others. The 'Mathesis Universalis' was intended for the beginner, and contains copious discussions on fundamental points of algebra, arithmetic, and geometry, mixed with critical dissertations. The tract against Hobbes's dialogue on the fifth book of Euclid is wholly controversial. The treatise on the cycloid is that which was sent in answer to Pascal's prize questions, revised. The work on mechanics is the largest and most elaborate which had then appeared, though not principally remarkable from the use of the principle of virtual velocities. The voluminous treatise which it contains on the centre of gravity, though shewing in every page how near Wallis approached to the Differential Calculus, is not so interesting, even in that particular, as the 'Arithmetica Infinitorum.' The treatise on algebra, which first appeared in English in 1685, was reprinted in Latin (in the collected edition) in 1693, with additions. It is the first work in which a copious history of the subject was mixed with its theory. The defect of this history has been adverted to in Vieta, and, but when this is passed over, it may safely be said that the algebra of Wallis is full of interest, even at the present time, not only as an historical work, but as one of invention and originality. The tracts on the angle of contact, on the tides, on gravitation, &c., are now completely gone by, and are only useful as shewing the state of various points of mathematics and physics.

The 'Arithmetica Infinitorum' is preceded by a treatise on Conic Sections, in which the geometrical and algebraical methods are both exemplified. At the commencement, though it is not immediately connected with any application to those curves, he opens with a declaration of his adherence to the method of CAVALIERI, that of indivisibles, but preferring the juster notion of compounding an area out of an infinite number of infinitely small parallelograms. At the beginning of the work Wallis arrives by this method at the area of various simple curves and solids. Those who understand how either the method of Cavalieri is employed, or that of differentials, without the use of the organised methods, will easily see how close an approach is made to the integral calculus, from one instance:—In the latter science $\int x^n dx$, beginning at $x = 0$, is $\frac{1}{n+1} x^{n+1}$: the corresponding theorem of Wallis is that the limit of $1^n + 2^n + \ldots + n^n$ divided by n^n is the fraction $\frac{1}{n}$. He then proceeds step by step until he is able to represent the whole or part of the area of any curve whose equation is $y = (a^{\frac{1}{m}} \pm x^{\frac{1}{m}})^n$, n being integer: having previously found the area of any curve contained under $y = ax^r$, n being positive or negative, whole or fractional. And it is here to be remarked that, though he does not absolutely exhibit such symbols as x^{-n}, $x^{\frac{1}{2}}$, he makes use of fractional and negative indices, applying the fractions and negative quantities, though not explicitly writing them in the modern manner. This step was a most important one, as it put under his control, in effect, all that the integral calculus can do in the case of monomial terms and their combinations. Wallis was eminently distinguished by this power of comparison and generalisation, and he had a large portion of the faith in the results of algebra which has led to its complete modern establishment, in which hardly any of that sort of faith is wanted. And those who would smile at his idea of negative quantities which are *greater than infinity*, should remember what results patience and inquiry have produced out of the equally absurd notion of those same quantities being *less than nothing*. It is not quite certain that the former phraseology will not yet take its place, under definitions, by the side of the latter.

This talent of generalisation, in which Wallis was superior to any preceding mathematician, enabled him to avail himself of ideas which the ordinary processes of arithmetic and algebra had offered for centuries without results. Having, by his use of fractional indices, been able to supply every case of $\int x^n dx$, or an equivalent result, it struck him that $\int (a^2 - x^2)^n \cdot dx$, still using modern symbols, must be capable of a similar interpolation. The case of $n = \frac{1}{2}$ obviously gives the circle, and after making various attempts, he was enabled to present the well-known result, which is still remembered as a result; but the method which produced it is, though anything but forgotten, not always duly remembered as belonging to Wallis. This result is as follows, in modern terms:—π being the ratio of the circumference to the diameter, $\frac{1}{\pi}$ lies between

$$\frac{2^2 . 4^2 . 6^2 \ldots . (2n)^2}{1^2 . 3^2 . 5^2 \ldots . (2n-1)^2 \cdot 2n+1} \text{ and } \frac{2^2 . 4^2 . 6^2 \ldots . (2n)^2}{1^2 . 3^2 . 5^2 \ldots . (2n-1)^2 \cdot 2n+2}$$

whatever integer n may be. It is frequently expressed thus:—

$$\frac{\pi}{4} = \frac{2}{3} \cdot \frac{4}{3} \cdot \frac{4}{5} \cdot \frac{6}{5} \cdot \frac{6}{7} \cdot \frac{8}{7} \times \ldots \text{ad infinitum.}$$

The works of Wallis contain many other results which must be considered as advanced specimens of the integral calculus in everything but form; such as the rectification of the parabola, which he showed to depend upon the quadrature of the hyperbola. The *Binomial Theorem* was a corollary of the results of Wallis on the quadrature of curves, the sagacity of Newton supplying that general mode of expression which it is extraordinary that Wallis should have missed.

We have not spoken of the work on logic, which is not only of the highest excellence, but is perhaps, owing to the change of notation and methods in mathematics, the only work of Wallis on the elements of a subject which we could now recommend a student to read. In conclusion, we may say of the subject of this article, that it rarely happens that there is so singular a union of originality and labour.

WALLIS, SAMUEL, the first navigator after Quiros (assuming that Quiros's Sagittaria is Tahiti) who discovered the island of Tahiti. The date of Wallis's birth and his parentage are unknown. In 1755 he was lieutenant of the Gibraltar, a twenty-gun ship, from which he was promoted to be lieutenant of the Torbay seventy-four, Vice-Admiral Boscawen's flag-ship. On the 8th of April 1757, he received his commission as captain of the Port Mahon, of twenty guns, and was sent to North America with Holburne, who commanded the expedition against Louisburg. In 1760 he was sent to Canada in command of the Prince of Orange, a reduced third-rate; and on his return was employed on the home station. There is no account of him from this time till his being appointed to the Dolphin in August 1766. He was sent out with the Dolphin (24 guns) and the Swallow (14 guns, Captain Carteret) to continue and extend the discoveries of Commodore Byron in the Pacific. They sailed on the 22nd of August 1766, from Plymouth. The Dolphin and Swallow parted company on the 11th of April 1767, as they were clearing the western end of the Straits of Magalhaens; the Dolphin returned to the Downs on the 19th of May 1768; the Swallow did not arrive at Spithead till the 20th of March 1769. After parting company with his consort, Wallis discovered Easter Island on the 3rd of June 1767; and on the 19th of June, Tahiti, which he called King George's Island, and Cook called Otaheite. He left the island on the 27th of July, reached Tinian on the 17th of September, Batavia on the 30th of November, the Cape of Good Hope on the 4th of February 1768, and the Downs, as mentioned above, on the 19th of May. The only record preserved of Wallis's circumnavigation of the globe is that printed in Hawkesworth's 'Voyages to the Pacific.' It appears to be a literal transcript of the navigator's diary. It indicates a painstaking, sensible, and veracious man. He was the first to bring down the fabulous stature of the Patagonians to its real altitude. It was Wallis who recommended Tahiti as the station for observing the transit of Venus over the sun's disc in 1769.

After his arrival in England, Wallis remained without employment till 1771, when, on the equipping of a naval force in consequence of the rupture with Spain about the Falkland Islands, he was appointed to the Torbay seventy-four. He retired from active service in the following year, and never again commanded a ship, except for a short time in 1780. In that year he was appointed extra-commissioner of the navy, an office which he held till the peace, when it was for a time discontinued. It was revived in 1787, and Wallis was again nominated to fill it, which he did till his death, in 1795.

WALMESLEY, CHARLES, an English mathematician and astronomer, was born in 1721: being a member of the Roman Catholic church, he became a monk of the Benedictine order in this country, and he took the degree of doctor in theology in the Sorbonne. In 1750 he was elected a Fellow of the Royal Society of London, and six years afterwards he was made a bishop, and apostolical vicar of the western district of England.

His principal work, which is an extension of the 'Harmonia Men-

Digitized by Google

sursarum' of Cotes, is entitled 'Analyse des Mesures des Rapports et des Angles, ou Rédnction des Intégrales aux Logarithmes et aux Arcs de Cercle,' 4to, Paris, 1749; in the same year he published his 'Théorie du Mouvement des Apsides,' 8vo, and in 1758 the treatise 'De Inæqualitatibus Motuum Lunarium,' 4to, Florence.

Dr. Walmesley was one of the mathematicians employed in regulating the calendar in this country, preparatory to the change of the style, which took place in 1752, and he wrote several papers on astronomical subjects, which were published in the 'Philosophical Transactions.' As a theological writer he is known only by his commentaries on, and explanations of the Apocalypse, Ezekiel's vision, &c. He died at Bath, November 25, 1797.

WALPOLE, SIR ROBERT, Earl of Orford, was the third son of Robert Walpole, Esq., M.P. for Castle Rising, by Mary his wife, only daughter and heiress of Jeffery Burton, and was born at his father's house, on the 26th of August 1676. He was educated at a private school at Massingham, and afterwards on the foundation at Eton, and at King's College, Cambridge; and although he was naturally averse to study, he applied himself with sufficient diligence to become a good classical scholar. On the death of his eldest surviving brother, in 1698, he gave up his scholarship at King's College, and very shortly withdrew from the university, and resided with his father in the country. On the 30th of July 1700 he married Catherine, daughter of Sir John Shorter, lord mayor of London; and on the 18th of November following his father died, and left him in possession of the family estate. He immediately entered parliament as member for Castle Rising, and at once engaged in business with much activity, and joined the Whigs in promoting the Protestant succession. Although he first attempt at oratory does not appear to have been very successful, he was not long in distinguishing himself as an able and practical debater and an acute politician. He attracted the attention of the great leaders of the Whig party; and in March 1705, when their influence had risen in parliament and in the cabinet, he was appointed one of the council to Prince George of Denmark, then lord high admiral. In this capacity he showed so much prudence and firmness under peculiar difficulties, that he won the esteem and confidence of Godolphin and the Duke of Marlborough. Henceforward he assumed a high position in parliament, and in 1709, on his promotion to the office of secretary-at-war, the management of the House of Commons was intrusted to him by his party. In 1710 he was appointed one of the managers for the impeachment of Sacheverel. He had strongly opposed that proceeding in private; but when it had been determined upon, he carried on conducting it chiefly devolved upon him. He afterwards published a pamphlet, entitled 'Four Letters to a Friend in North Britain upon the publishing the Trial of Dr. Sacheverel,' in which he laboured to identify the party who supported Sacheverel with the Jacobites who were plotting to raise the Pretender to the throne. By the intrigues of Mrs. Masham and the Tories, and by disunion among themselves, the Whig administration was shortly broken up, when Harley thought so highly of Walpole's talents and influence that he vainly endeavoured to persuade him to accept office. He was then in opposition, and declared him to be worth half his party. Party spirit was then most virulent, and in order to crush their opponents the Tory government, under Harley and St. John, charged the ex-ministers with extensive corruption and insecurity in the public accounts. The defence of his colleagues was ably conducted by Walpole; but he was punished for his zeal on their behalf, by a similar accusation directed against himself personally. On the 17th of January 1712, a majority of the House resolved that while secretary-at-war he had been "guilty of a high breach of trust and notorious corruption," and that he should be committed to the Tower and expelled the House of Commons. He refused to make any acknowledgment or concession, and remained a prisoner in the Tower until the prorogation. Meanwhile his friends looked upon him as a martyr to their cause, and flocked to his apartments, which here, it is said, the appearance of a crowded levée, rather than of a prison. He was re-elected for Lynn; but (in accordance with a doctrine afterwards declared illegal in the case of Wilkes) was declared incapable of sitting in that parliament. He did more for his vindication with his pen while in prison, than he could have done in the face of his enemies, who had already condemned him. A pamphlet published by him at that time was declared by his party to be a complete refutation of the charges affecting his character. Whether this be so or not, his expulsion was no obstacle to his future advancement, but rather increased his influence. At the dissolution, in August 1713, he again entered parliament as member for Lynn, and took a distinguished part in all the debates and in the counsels and intrigues of his party.

On the accession of George I., Walpole, with his brother-in-law Viscount Townshend, had a principal share in the formation of the Whig administration. He was himself appointed paymaster-general of the forces and of Chelsea Hospital. The dissolution of 1715 having gained a large majority for the Whig ministry, they had an opportunity of avenging themselves for the persecution they had suffered from their predecessors in office. The intrigues of many of the leading Tories in favour of the Pretender during the last four years of the reign of Queen Anne had been notorious; and, apart from political expediency, it became the duty of the ministers of the first king of the house of Hanover to denounce, and if possible extinguish the faction that had nearly succeeded in altering the succession to the throne. Walpole drew up the report on which the impeachments and attainders that followed were founded, and took a leading part in all the prosecutions. The rebellion in favour of the Pretender soon afterwards broke out, in the midst of which Walpole was appointed first lord of the treasury and chancellor of the exchequer. The fatigue and anxiety of that alarming time brought on a severe illness. Before his recovery the memorable Septennial Bill, which had been prepared with his concurrence, was passed. It was perhaps scarcely justifiable on constitutional grounds to prolong the duration of a parliament that had only been chosen for a shorter term; but the extraordinary circumstances of the country, a threatened invasion, a strong party—possibly even a parliamentary majority—favourable to the claims of the Pretender, rendered a dissolution at that time highly dangerous to the public peace and to the safety of the crown. Disunion in the cabinet and the constant intrigues of the Hanoverian courtiers and the king's mistresses broke up this administration, which would otherwise have had a fair chance of stability; and in April 1717 Walpole delivered up his seals to the king, in spite of his majesty's earnest solicitations that he would retain them in connection with a new ministry. Before his resignation Walpole had submitted to parliament a plan for reducing the interest of the national debt, and for establishing a sinking fund. The resolutions had already been agreed to, but the bill for giving effect to them was left to his successors to carry through. (See 5 Geo. I., c. 3.) Walpole remained in opposition until 1720. Meanwhile he distinguished himself by the ability and practical knowledge with which he opposed the measures of government. He exposed the South Sea scheme for liquidating the national debt when first propounded by the government; and though parliament was deluded by its plausibility and magnificence, and scarcely listened with patience to his arguments, the country had soon reason to remember his remarkable prediction, that "such will be the delusive consequences, that the public will conceive it a dream."

In June 1720 he consented to take office, and was appointed paymaster-general of the forces, while Lord Townshend was made president of the council; but he did not cordially support the administration, and never engaged much in business until the excitement caused by the failure of the South Sea speculations had verified his prediction. He was then unanimously called upon to devise measures for the restoration of public credit. No minister was ever placed in a more difficult position. The terror and phrenzy of the public, the indignation of parliament, the helplessness of the king, and the universal connection of some of them with the scheme, were obstacles to the proper consideration of so pressing a subject. It was indeed impossible to repair the mischief already done, or to indemnify parties for the losses they had sustained, but he succeeded in restoring public credit; and he undoubtedly showed both firmness and moderation in the punishment of those who had been guilty of participation in the frauds of the company. Lord Sunderland had been accused of receiving fictitious stock, but by the exertions of Walpole he was acquitted. He was, however, however sufficiently clear in public estimation to retain his office of first lord of the treasury, and on his resignation, in April 1721, Walpole was appointed in his place, with an administration highly favourable to his interests.

Having settled for a time the financial affairs of the country, Walpole immediately turned his attention to commerce. He found heavy taxes and restrictions upon the imports and exports of many of the most important articles of commerce, and, with a spirit far in advance of his age, he removed them. One hundred and six articles of British manufacture or produce were allowed to be exported, and thirty-eight articles of raw materials to be imported, duty free. In June 1723 the king created Walpole's son a peer, by the title of Baron Walpole of Walpole, in the county of Norfolk. Walpole had declined this honour himself, from the fear of losing his influence over the House of Commons if removed to the Upper House, but other marks of royal favour were not wanting. In 1724 he was created a Knight of the Bath, and in 1726 was installed a Knight of the Garter. But though strong in parliament, and standing well with the king, Walpole was continually in danger from the intrigues of the court. On the accession of George II. however Walpole was so fortunate as to find a protector in Queen Caroline, whose influence over the king enabled her to maintain Walpole in office, although a change had been determined upon, and afterwards to support him against the persevering machinations of all parties.

To follow Sir Robert Walpole through the events of his long administration would require little less than a history of his times. There were no important debates in parliament, no deliberations in the cabinet, no negociations with foreign states, in which he did not bear the most conspicuous part as the first statesman of his day. The most remarkable measure proposed by him, and that which is perhaps the most creditable to his talents as the minister of a commercial country, was his Excise scheme, brought forward by him in 1733. The object of this measure was to convert the Customs' duties payable upon certain articles of import immediately on their arrival in port into Excise duties payable on taking them out of warehouses for home consumption. He also proposed to confine the taxed commodities to a few articles of general consumption, and to exempt from taxation the principal necessaries of life and all the raw materials of manu-

Digitized by Google

facture. The plea itself and the arguments by which he supported it prove the soundness of his views of taxation and commerce; but unhappily the measure was artfully misrepresented as a scheme for a general Excise, and the country being misled by the able writers opposed to the minister, by the clamours of those interested in existing abuses, but more than all by the unpopular name of 'Excise,' were almost unanimous in its condemnation. Public feeling became at length so excited that a popular outbreak seemed to threaten any further progress with the bill; and Sir Robert was very reluctantly obliged to abandon it. He was fully persuaded of its great advantages to the country, but said, "I will not be the minister to enforce taxes at the expense of blood."

In 1737 the influence of Walpole was much shaken, first by the quarrel between the king and the Prince of Wales, and the open hostility of the latter to the king's government, and especially to Walpole, who had been chiefly consulted by the king; and, secondly, by the death of Queen Caroline. The high regard of the queen for Walpole was testified even on her death-bed. Turning to the minister, who, with the king, was standing by her bedside, she said to him, "I hope you will never desert the king, but continue to serve him with your usual fidelity;" and, pointing to the king, she added, "I recommend his majesty to you." Shortly afterwards the king showed Walpole an intercepted letter, in which it was affirmed that the minister had now lost his sole protector. "It is false," said he; "you remember that on her death-bed the queen recommended *me* to *you*."

Walpole was soon in the midst of great embarrassments. The king, the people, a strong minority in the Commons, a majority in the Lords, and a preponderance in the cabinet, were eager for war with Spain. Walpole endeavoured to avert it as a national calamity, but was overpowered by the union of so many parties in its favour. He then felt how much his popularity had suffered from his opposition to the war, and feared that any failures would be laid to his charge. He entreated the permission of the king to resign, but his majesty exclaimed, "Will you desert me in my greatest difficulties?" and refused to accept his resignation. In the midst of the discussions upon the Spanish war, he had also been deserted by the Duke of Argyle, whose talents in debate and personal influence had been important to him in the measures. Discord ensued in the cabinet, and the opposition in parliament became more strenuous than ever. In February 1740 a motion was made, by Sandys, for an address to the crown for the removal of Sir Robert Walpole "from his majesty's presence and counsels for ever." No distinct charges were made against the minister to justify so strong an address; but every complaint against the measures of his government, foreign or domestic, during the last twenty years, was used as a reason for his dismissal. "If a minister be found himself in a bad majority, all these evils to one person, I reply, because one person grasped in his own hands every branch of government; that one person has attained the sole direction of affairs, monopolised all the favours of the crown, compassed the disposal of all places, pensions, titles, ribands, as well as all preferments, civil, military, and ecclesiastical." Walpole defended himself with becoming boldness and dignity, and referred with pride to the successes of his administration. The motion was negatived by a large majority, and a similar motion in the House of Lords met with the same fate. But, notwithstanding this triumph, his power was nearly exhausted. A dissolution immediately followed; his opponents were active at the elections; many of his friends kept back; he himself was indolently confident of success; and on the meeting of the new parliament he found himself in a hopeless minority. After some divisions, he was, on the 2nd of February 1742, left in a minority of sixteen, on the Chippenham election case. On the 9th he was created Earl of Orford by the king, and on the 11th he resigned. On taking leave of him the king burst into tears, expressed his regret for the loss of so faithful a counsellor, and his gratitude for his long services.

No sooner was a new administration formed under Pulteney (which, through the influence and address of Walpole, had been composed chiefly of Whigs), than an attack was made upon the ex-minister. On the 9th of March, Lord Limerick moved in the House of Commons for a secret committee to inquire into the administration of Sir Robert Walpole during the last twenty years, but his motion was lost by a majority of two. Lord Limerick very soon made a second motion, but proposed to include only the last ten years in his inquiry. This motion was carried by a majority of seven, and a committee of secrecy was appointed. Of the twenty-one members of this committee, nominated by ballot, all except two had been Walpole's uniform opponents. The committee, failing to obtain the evidence of corruption which they had expected, endeavoured to frame a bill of indemnity for all persons who would make discoveries, but this invidious and unjust measure was rejected by the House of Lords. The committee nevertheless made a report, in which they charged Walpole—1, with having used undue influence at elections; 2, with grants of fraudulent contracts; and, 3, with peculation and profusion in the expenditure of the secret service money. These charges were but ill supported, and considering the clamours that had been raised against the minister, the decided enmity of the committee, and the ample means at their disposal, the report must be regarded, if not as a verdict of acquittal, at least as one of *not proven*. A motion for renewing the inquiry was repeated in the following session, but was defeated by a large majority. From this time Walpole took very little part in public affairs. He was frequently consulted by the king, and retained much political influence, but rarely spoke in the House of Lords, having observed to his brother that he had left his tongue with the Commons. After dreadful suffering from the stone, which he bore with admirable fortitude, he died on the 18th of March 1745, in the sixty-ninth year of his age, and was buried in the parish church at Houghton.

The character of no public man has ever been more misrepresented than that of Walpole. He had the misfortune to be actively opposed by the first wits of his day. The brilliant talents of Bolingbroke, Chesterfield, Swift, and Pope, filled the press with sarcasms, and misled the public by the most artful misconstruction of his acts. Even the stage was made subservient to opposition. In parliament he also had to contend with opponents, men of genius and acquirements than himself, but not perhaps more able and ready in debate. Supported as they were by the literary talents of their friends, and having more plausible and popular topics to dilate upon, they succeeded in maintaining a perpetual outcry against the minister. How far he deserved it may in some measure be judged from the fact that no points of his policy met with so much execration as his Excise scheme and his resistance to the Spanish war; both of which have since been applauded by posterity. As regards the corruption with which he was charged, Burke affirmed that he was less chargeable with it than any minister who ever served the crown for so great a length of time. At all events the Commons, being then comparatively unrestrained by popular election, were more open to corruption than at the present day, and the low morality of the times encouraged it. The extremely critical circumstances in which Walpole was placed by the claims of the Pretender and the unpopularity of the house of Hanover, must also be pleaded in his justification. His zeal for the Protestant succession was certainly the main principle of his political life and conduct. Unquestionably the same great ambition who vindicated him from the obarge of systematic corruption thus sums up his services:—"The prudence, steadiness, and vigilance of that man, joined to the greatest possible lenity in his character and his politics, preserved the crown to this royal family, and with it their laws and liberties to this country." (Burke's "Appeal from the New to the Old Whigs," p. 63.)

In private life he was distinguished by his hearty good nature and social dispositions. His conversation and manners were somewhat coarse and boisterous, but he had the happy art of making friends, and great powers of persuasion. For business of all kinds he had an extraordinary capacity, and the ease with which he executed it led Lord Hervey to say that "he did everything with the same ease and tranquillity as if he was doing nothing."

WALPOLE, HORACE, 2nd Earl of Orford, was the third and youngest son of Sir Robert Walpole, by Catherine Shorter, his first wife, and was born on September 24th, 1717, O.S. When he had finished his education at Eton, and at King's College, Cambridge, he left England and travelled on the Continent for more than two years. For the greater part of this time he was accompanied by Gray, the poet, with whom he had formed a friendship at school; but a difference unfortunately arose between the two friends, and they parted at Reggio, in July 1741, and returned to England by different routes. On his return home, in September 1741, Walpole took his seat in the House of Commons as member for Callington, for which place he had been elected during his absence. His father's administration was at that time in the midst of the difficulties which shortly afterwards caused its downfall, and he could not fail to be deeply interested in all that passed around him. He did not however take any prominent part in the debates. His first speech was delivered in March 1742, on a motion for inquiring into the conduct of Sir Robert Walpole for the preceding ten years of his administration, and was favourably noticed by Mr. Pitt, afterwards Earl of Chatham, and by Seeker, at that time Bishop of Oxford. When the interest excited by his father's affairs had subsided, he was very rarely induced to address the House. He moved the address in 1751, and spoke in 1756 on the question of employing Swiss regiments in the colonies. In 1757 he exerted himself with much ardour in favour of the unfortunate Admiral Byng. These are the only events of his public life, although he remained in parliament till 1768, a period of twenty-eight years. In 1744 he had exchanged his seat for Callington for Castle Rising; and from 1754 he represented King's Lynn, the only borough which had returned either father or cousin to parliament. Public life was not suited to Horace Walpole's pursuits and tastes, but he was always much interested in politics. His family connections had early identified him with the Whig party, but his speculations verged upon republicanism. To show his reverence for popular rights and his affected hatred of kings, he hung up in his bedroom an engraving of the death-warrant of Charles I., and wrote upon it, "Magna Charta." These abstract opinions however were not likely to lead him into any practical extravagance, for his habits and temper of mind were fastidiously aristocratic.

The principal amusement and business of Walpole for many years of his life were the building and decoration of his Gothic villa of Strawberry Hill, at Twickenham. It was originally a cottage, which he purchased in 1747, but grew under his hands into a so-called mansion of considerable extent. It would be difficult to compliment his taste in architecture, but the Gothic style was not at that time in vogue, and many faults and absurdities which are now apparent at

Digitized by Google

Strawberry Hill must be referred to the novelty of the attempt to apply to a modern domestic residence the characteristics of an ancient style. He collected works of art and curiosities of every description to ornament his house and gratify his taste—prints, pictures, miniatures, armour, books, and manuscripts. He was enabled to indulge in these expensive pursuits by the profits of three sinecure offices which his father had obtained for him, namely, usher of the exchequer, comptroller of the pipe, and clerk of the estreats.

To the tastes of a virtuoso he added those of a man of letters. His earliest compositions were in verse, and though many of them are sprightly and agreeable, they are not imaginative, and evince but little aptness for versification. In 1752 he published his 'Ædes Walpolianæ,' a work of little pretension, being in fact a catalogue of his father's pictures at the family seat of Houghton Hall in Norfolk; but, like other literary works of the same author, it was consistent with his favourite pursuits and studies, while it ministered to his family pride. In 1761 he commenced the publication of 'Anecdotes of Painting in England,' which were not completed until 1771; and in 1763 he added a 'Catalogue of Engravers.' Both these works were founded upon materials supplied by Vertue, the celebrated engraver, which Walpole worked up into several entertaining volumes of anecdote and criticism upon the fine arts. In 1758 he published his 'Catalogue of Royal and Noble Authors.' In this work he contrived to enliven a loog list of peculiarly dull writers with agreeable anecdotes, and a smart and happy style of writing, for which he is remarkable.

Walpole's celebrated novel, the 'Castle of Otranto,' appeared in 1764, as a translation, by William Marshall, from the Italian of Onuphrio Muralto, which the author intended as an anagram of his own name. This romance, being a new style, excited various opinions at the time, but it was, on the whole, eminently popular and successful, and is still read with interest as one of our standard novels. Four years later, another work of imagination was published. The tragedy of 'The Mysterious Mother' is founded upon a disgusting tale of incest "more truly horrid even than that of Œdipus," as Walpole himself describes it, and is worked up with great dramatic spirit.

His next publication was the 'Historic Doubts on the Life and Reign of King Richard III.,' an ingenious and acute examination of the evidence upon which historians have founded their accounts of the principal events of that period. Besides these larger works he was continually publishing minor compositions, such as various papers in the 'World' and other periodicals, his 'Essay on Modern Gardening,' the 'Hieroglyphic Tales,' and 'Reminiscences of the Courts of George I. and II.' He also prepared 'Memoirs' of the last ten years of the reign of George II., which were not published until after his death; and of the first twelve years of the reign of George III., which first appeared, in 4 vols. 8vo, in 1844, &c., under the editorship of Sir Denis le Marchant. These contain many curious events not recorded elsewhere, but little reliance can be placed upon them as an historical work, for the author's prejudices and political partialities are too open to entitle his evidence or judgment to much weight.

But the cleverest and certainly the most entertaining of all Walpole's writings are his letters, addressed to various friends, collected by himself, and published at different times since his death. Walter Scott calls him "the best letter-writer in the English language," and Byron speaks of his letters as "incomparable." Another writer remarks that "his epistolary talents have shown our language to be capable of all the charms of the French of Madame de Sévigné." No one indeed can fail to be entertained by the inexhaustible fund of anecdote, of gossip, of lively and fanciful conceits, of scandal, and bons-mots, with which nearly every page is enriched. The style is gay and sprightly, and admirably suited for correspondence. That his letters bear the spontaneous communications of a friend unbending his mind in familiar intercourse with another, and writing without forethought or labour, they could only have been the work of a man of the highest talent; but a less exalted opinion is necessarily formed of the man, when we discover that the ease and freedom of style which we have been entrapped into admiring as natural, were the result of laborious care and study. He was always on the alert collecting anecdotes, and dressing up epigrams which he afterwards inserted in his letters as if they had occurred to him at the moment. And, both in his letters and his History "his want of accuracy, or veracity, or both, is," as Mr. Hallam very justly remarks, ('Constitutional Hist.,' iii. 383,) "so palpable (above all in his verbal communications), that no great stress can be laid upon his testimony." Many of his letters were published in the 4to. edition of his works in 1798, and subsequently his letters to Mr. Montagu and Mr. Cole, to Lord Hertford and the Rev. Henry Zouch, and to Sir Horace Mann, have appeared at different times. The whole of the letters of Horace Walpole have since been collected, and were published, in six volumes, octavo; but a new and more complete edition of 'The Letters of Horace Walpole' was published in 1856, in 9 vols. 8vo., under the editorship of Mr. Peter Cunningham. It extends from 1735 to 1797. Some additional letters will be found in 'Extracts from the Journals and Correspondence of Miss Berry,' 1865.

Horace Walpole had not been contented with collecting rare and curious books and publishing his own works, but, still further to gratify his literary tastes, he established in 1757 a private printing-press at Strawberry Hill. Here he printed the Odes of Gray with Bentley's illustrations; his own 'Anecdotes of Painting;' a 'Description of Strawberry Hill;' a quarto edition of 'Lucan,' with the notes of Grotius and Bentley; a 'Life of Lord Herbert of Cherbury,' by himself; Hentzner's 'Travels;' and Lord Whitworth's 'Account of Russia.' He had also, so early as the year 1768, formed an intention of printing a quarto edition of his own works, which he soon afterwards commenced. But he never proceeded beyond the second volume, in consequence (as his editor, in 1798, says) of his "frequent indispositions, and the unimportant light in which, notwithstanding the very flattering reception they had met with from the world, he always persisted in considering his own works."

In 1791 he succeeded his nephew, George, third earl of Orford, in the title and estates of his family, and it is curious that, notwithstanding his high respect for rank and title, he was not gratified by his accession of dignity. He never even took his seat in the House of Lords, and rarely used the title when he could avoid it. Some of his letters after that period were signed by "the uncle of the late earl of Orford." He lived for six years afterwards, in the full possession of all his faculties, though his limbs had been paralysed by the frequent attacks of the gout, from which he had suffered. He died in the eightieth year of his age, at his house in Berkeley-square, on the 2nd of March 1797.

Horace Walpole cannot be regarded either as a wise or as a great man. Weakness, vanity, and inconsistency were prominent features of his mind, and his works do not prove it to have been susceptible of any high reason of thought or principle. He had a natural taste for small and trifling things, and an aversion to the more important business of life; but these it is true that he always professed to be a gentleman of ease and fashion, whose literary efforts were undertaken not for fame, but for recreation. He affected to disclaim the character of a man of letters, but was acutely sensitive to criticism, greedy of praise, and envious of the fame of others. He pretended to despise the court, yet all his thoughts were of kings, princes, and courtiers. He was a republican and an aristocrat. He worshipped rank, yet when it fell to his lot was ashamed to assume it. In private life he showed no remarkable virtues, nor is he chargeable with any serious faults.

WALSINGHAM, OR WALSYNGHAM, SIR FRANCIS, an English statesman of distinguished ability, was descended from an ancient family, and was born at Chiselhurst in Kent, it is commonly stated in the year 1536. The authority for this date we believe to be an account, transmitted by a correspondent to the publishers of a work called 'British Biography,' vol. iii., 8vo. London, 1767, of an original portrait of Walsingham painted in 1578, making him then forty-two years of age. (See note to p. 295.) He was the third and youngest son of William Walsingham, Esq. of Scadbury, in the parish of Chiselhurst; and of Joice, daughter of Edmund Denny, Esq. of Cheshunt in Hertfordshire.

After studying at King's College, Cambridge, Walsingham went to travel on the Continent; and he remained abroad, making active use of his opportunities of examining the state of foreign countries and acquiring their languages, till after the accession of Elizabeth. On his return to England his accomplishments recommended him to the notice of Cecil, under whom he was soon introduced to high and confidential employment in the public service. His first important mission is generally assumed to have been to France in the earlier part of the reign of Charles IX., but nothing further is known of it than what is stated in his epitaph, that after reaching the age of manhood (maturæ jam ætate) he was Queen Elisabeth's orator, or representative, at the court of the King of France (apud Gallum), for several years, in a most turbulent time. But it does not appear why the words in the epitaph may not refer to what is generally called Walsingham's second French embassy, upon which we know that he was sent in August 1570, and which detained him at Paris till April 1573. On his return home he was appointed one of the principal secretaries of state and sworn of the Privy Council; and soon after he was knighted. In 1578 he was sent as ambassador to the Netherlands; in 1581 again to France; and in 1583 to Scotland. In October 1586, having had all along the chief direction of the measures that were taken for the detection of Babington's conspiracy, he served as one of the commissioners at the trial of Mary, Queen of Scots. Soon after this, according to his epitaph, he was made chancellor of the duchy of Lancaster; but he appears to have still occupied himself chiefly with the conduct of foreign affairs, and it must have been in 1587 that, if we are to believe a story which is commonly told, he managed to retard for a time, but not the preparations of the Spanish Armada, by getting the bills upon which the money was to be raised protested at Genoa, through the agency of Sutton, the founder of the Charter House, having previously discovered the design of the King of Spain in fitting out that armament by having the letter of his majesty to the pope, in which the secret was intimated, stolen from the cabinet in which it was locked up, through the medium of a Venetian priest retained as his spy at Rome, who got a gentleman of the bedchamber to take the key out of his holiness's pocket while he was asleep. Such a proceeding, strange as it now sounds, was not at all foreign to the spirit or practice of the statesmanship of that age, and was quite after the manner of Walsingham, whose system was founded upon and maintained by bribery, espionage, and all the forms of deception. "To him," says his warm admirer and panegyrist, Lloyd, "men's faces spake as much

Digitized by Google

as their tongues, and their countenences were indexes of their hearts. He would so beset men with questioce, and draw them on, that they discovered themselves wheth r they aoswered or were silent. He outdid the Jesuits in their own bow, and overreached them in their own equivocation and mental reservation; never settliog a lie, but warily drawing out and discovering truth. So good was his intelligence, that he was confessor to most of the papists before their death, as they had been to their brethren before their sickness. He maintained fifty-three agents and eighteen spies in foreign courts; and, for two pistoles an order, had all the private papers in Europe. . . . . Few letters escaped his hands; and he could read their contents without touching the seal.

For all this, Walsingham was the very reverse of a man of mere policy and expediency. His personal integrity and disinterestedness are unquestionable; his morality was strict, to the verge of asceticism; his religious zeal drew him all his life towards puritanism, and in his latter days lifted him above the enjoyments and the cares of this world. For some time before his death he seems to have retired from business, and to have spent his time, with little or no society, at his house at Barn-Elms. Here he died on the 6th of April 1590. Camden says that he had "watched the practices of these men [the papists] with no green eye, that he lessened his estate by that means, and brought himself so far in debt, that he was buried privately by night, in St. Paul's Church, without any manner of funeral solemnity." Elizabeth, with all her professed appreciation of Walsingham's diligence and important services, seems to have left him abrought on his life in short allowance. Even of honours, if we except his knighthood and the office to which he was appointed, he had none. Camden says he was a Knight of the Garter, and has been generally followed in that statement; but we believe it is unfounded.

Walsingham was married to a lady of the name of St. Barbe, and by her he left one daughter, Frances, who became successively the wife of Sir Philip Sidney, of Robert Devereux, the unfortunate Earl of Essex, and of the distinguished soldier Richard Burgh, created by Charles II. Earl of St. Albans in the English peerage, but better known by his inherited Irish title of Earl of Clanricarde. She died, after bringing her last husband a son, in 1602.

The history of Walsingham's French embassy of 1570-73 is contained in Sir Dudley Digges's "Complete Ambassador; or, Two Treatises of the intended Marriage of Queen Elizabeth, &c." (posthumous memory; comprised in letters of negotiation of Sir Francis Walsingham, her resident in France; together with the answers of the Lord Burleigh, &c.' folio, London, 1655. There is a short paper by Walsingham, entitled 'Sir Francis Walsingham's Meditations of Honesty, Ambitioo, and Fortitude,' in the 'Cotton Posthuma; or, Divers and Choice Pieces of Sir Robert Cotton,' London, 4to, 1672. His authorship of the treatise entitled 'Arcana Aulica; or, Walsingham's Manual, or Prudential Maxims,' which has been several times printed, is doubtful.

WALSINGHAM, or WALSINGHAMUS, THOMAS, an English historian of the 15th century, was a native of Norfolk, and e mouk of the Benedictine abbey of St. Albans. Bishop Nicolson conceives that he was "very probably Regius professor of history in that monastery about the year 1440," but it is now known that no such office existed. Walsingham wrote—'Historia Brevis, ab Edvardo primo ad Henricum quintum' (it extends in fact from 1273, the first year of Edward I., to 1422, the last year of Henry V.); also, 'Ypodigma Neustriæ, vel Normanoiæ, ab irruptione Normanorum usque ad annum 6 regni Henrici quinti' (1413). Both these works were published together by Archbishop Parker, in folio, London, 1574. Both are also contained in Camden's 'Anglica, Normannica, Hibernica, Cambrica, a Veteribus Scripta,' Frankfort, 1603; the 'Historia Brevis,' from p. 57 to 403; the 'Ypodigma Neustriæ,' from p. 409 to 592. Walsingham, in his 'Historia Brevis,' takes up the narrative from the point where Matthew Paris ends; "and he might well," Nicolson observes, "seem to be Paris's continuator, were his language answerable to his matter." But although his style is not to be commended, Walsingham has in both his works preserved many facts which are not elsewhere to be found. The best edition of Walsingham's 'Hist. Brevis' is that edited by Mr. H. T. Riley, and issued in the Rolls series of Chronicles and Memorials, among the 'Chronica Monasterii S. Albani,' under the title 'Historia Anglicana,' in 2 vols. 8vo., 1863-65.

WALTER, JOHANN GOTTLIEB, a celebrated anatomist, was born at Konigberg in 1739; the 'Biographie Universelle' says in 1734. He early evinced a desire to study medicine, but his father was opposed to it, and on his death-bed made his son promise that he would devote himself to the study of jurisprudence. But so strong was his desire to pursue medical science, especially anatomy, that he broke his promise to his father, and commenced the study of medicine in his native city. He afterwards went to Frankfurt-on-Oder, where he graduated in 1757. From this place he removed to Berlin for the purpose of studying under the celebrated Meckel, and such was the progress he made in anatomy, that in 1762 he was appointed second professor in the anatomical theatre of the Collegium Medico-Chirurgicum of Berlin. On the death of Meckel in 1774 he was appointed first professor of anatomy, and also professor of midwifery. He died on the 4th of January 1818. During the whole of his life he was remarkable for the zeal and activity with which he pursued his favourite science of anatomy, and more especially that department which was connected with the branch of practical medicine which he taught. He collected a valuable museum of anatomical and pathological specimens, which was purchased by the king of Prussia for 100,000 dollars in the year 1804, and which still exists at Berlin under the name of Walter's Museum. This museum consisted of nearly 3000 specimens, the result of the dissection of upwards of 8000 dead bodies. He wrote several works on various departments of anatomy and midwifery. In addition to numerous essays and papers, he published the following works:—'Abhandlung von trokneo Knochen' (A Treatise on the Bones of the Human Body), 8vo, Berlin, 1762; 'Observationes Anatomicæ,' folio, Berlin, 1775; 'Myologisches Handbuch' (A Manual of Myology), 8vo, Berlin, 1777; 'Von den Krankheiten des Bauchfelles und der Schlagfusse' (On Diseases of the Abdomen and on Apoplexy), 8vo, Berlin, 1785. Of these the anatomical works have gone through several editions, and his miscellaneous papers are valuable contributions to medical science. A complete list of his numerous works and papers is given in the 'Biographie Universelle' and in the 'Neuestes Conversations-Lexicon.'

WALTER, JOHN, late manager and principal proprietor of 'The Times' newspaper, was born in 1784. His father, John Walter, was born in 1739. He was known as the topographic printer, from his having obtained a patent for an invention named Logography, or the art of printing with entire words, their roots, and terminations, instead of the arrangement of single letters. On the 1st of January 1788, he published the first number of 'The Times,' and was during eighteen years printer to the Board of Customs, but that employment was taken from him about 1805, in consequence of the opinions expressed in 'The Times' with reference to Lord Melville's administration at the Admiralty. He died November 16, 1812, at Teddington, Middlesex.

The late John Walter became a joint proprietor and the exclusive manager of 'The Times' at the commencement of the year 1803. It would not be easy to describe the improvements which were made in 'The Times' under his management. The munificent sums paid to the editor and to those literary gentlemen of the highest class who furnished the leading articles, the large staff of reporters at liberal salaries for parliamentary debates, law proceedings, and public meetings, the large amount and expense of foreign and almost universal correspondence, the competition even with the government for priority of intelligence, the distinct arrangement of the matter, the application of steampower for the printing, and the marvellous rapidity with which the whole is produced, have raised 'The Times' to a position of social and political importance in which it is without a rival not only in Great Britain but in Europe.

The invention of the printing-machine, and the use of the steam-engine as a moving power have produced so great a revolution in the process of printing, as to require a brief account of the origin and progress of the invention. As early as 1804 an ingenious compositor named Thomas Mertyn had made the model of a machine for printing, which met with the approval of Mr. Walter, who expended a considerable sum in the attempt to complete the machine; but having exhausted his own funds, and his father, who had hitherto assisted him, having refused him any further aid, the attempt was abandoned. About the same period Mr. Koenig, a native of Germany, had made some progress in the contrivance of a machine for printing, but meeting with no encouragement in his own country, came to England. He was introduced to Mr. Bensley, a well-known printer, who being satisfied as to the feasibility of the projected improvement, supplied the necessary funds. An ingenious assistant of the name of Bauer was also engaged, and the work proceeded till the year 1809, when Mr. Bensley, requiring additional funds, invited the late Mr. George Woodfall, and Mr. Richard Taylor, both well-known printers, to join him and Mr. Koenig in taking out a patent, which they did, the machine not even then being so far advanced as to satisfy them as to the prospect of success, and to enable them to have specifications drawn up. The first patent bears date March 29, 1810. It was taken out in the name of Frederic Koenig, and was assigned by articles of partnership to the firm of Bensley, Koenig, Woodfall, and Taylor. Mr. Koenig states ('The Times,' December 29, 1814) that "sheet n of the 'New Annual Register' for 1810, 'Principal Occurrences,' was printed by my machine, and it is, I have no doubt, the first part of a book ever printed by a machine." The machine was set to work regularly in April, 1811. Another improved machine on an improved plan was taken out October 30, 1812. It was completed in December that year, and printed about 800 copies an hour. A third patent for another improved machine was taken out July 23, 1813. Mr. Koenig's first machines were worked by hand, the machines in a large body independent of the motive power. Mr. Perry, of the 'Morning Chronicle' was applied to, but declined to purchase a machine. Mr. Walter however, seeing the invention accomplished and the machine in full operation, gave an order for two machines, which were to be worked by the power of a steam-engine. Notwithstanding violent opposition from the pressmen, the machines were completed on adjoining premises, and on the 29th of November 1814, 'The Times' was printed for the first time by machines worked by steampower. The number impressed in the hour was then about 1100.

Digitized by Google

Great improvements have since been made by the late Professor Edward Cowper and others, in the machines for printing books as well as newspapers. About 12,000 per hour is the number now printed of 'The Times,' and the total number per day is upwards of 50,000.

Mr. Walter married in 1818. Having purchased a fine estate in Berkshire, he became a candidate for the representation of that county in December 1832, and was returned. He was re-chosen in 1835, but in 1837 resigned his seat in consequence of the opinions of the majority of those who had elected him being opposed to his own on the question of the new Poor Laws. In 1840 he offered himself for the borough of Southwark, but was rejected. In April 1841 he was returned for the borough of Nottingham, and at the general election the same year announced himself as a candidate, but in consequence of serious rioting, withdrew half an hour before the poll was opened. He died July 23, 1847, at his residence, Printing-House Square, Blackfriars, London.

* JOHN WALTER, son of the late John Walter, and his successor in the proprietorship and management of 'The Times,' was born in 1818 in London. He was educated at Eton College and at Exeter College, Oxford, where he took the degree of B.A. in 1840, and M.A. in 1842. In 1847 he was called to the bar of Lincoln's Inn. In 1843 he contested the borough of Nottingham, without success, but was returned for it in 1847, and till 1859 continued to represent it as a moderate Liberal. He conducts 'The Times' on the principles of his father, and with undiminished success.

WALTHER, BALTHASAR, Latinised WALTHERUS or GUALTERUS, was born at Allendorf in Thuringia in the latter part of the 16th century. He studied divinity at Jena, and paid great attention to classical and oriental languages. He was appointed professor of Greek and Hebrew at Jena, and subsequently became superintendent of the Lutheran church in the duchy of Saxe-Gotha, and in the duchy of Brunswick-Wolfenbüttel. He died at Brunswick on the 15th of November 1640. He is the author of, 1, 'Distinctio Temporum Constantini Magni Baptismo, Donatione, et Legatione ad Concilium Nicaenum, contra Baronium;' 2, 'Problemata Hebraica, Chaldaica, Syriaca, Graeca;' 3, 'De Papae Primatu et Anti-Christo;' 4, 'Lutherus natus, denatus, à Papicolarum Calumniis vindicatus;' 5, 'Vierzig Fragen von der Seel: in Ursteng, Essenz, Wesen, Natur und Eigenschaft, wider Jacob Böhmen.' This work is a refutation of the doctrines of the celebrated theosophist Jacob Böhmen. The Life of Walther is not in Freherus, 'Theatrum Virorum eruditione clarorum,' as Jöcher pretends, in his 'Allgemeines Gelehrten-Lexicon.'

(Comp. Zeumerus, *Vitae Professorum Jenensium.*)

WALTHER, CHRISTIAN, was probably born in Hesse, in the beginning of the 16th century. He studied divinity, took orders, and lived a considerable time in a convent in Germany, the name of which is unknown. He afterwards left his convent and adopted the Protestant faith. Having settled at Wittenberg, he became acquainted with several of the great Protestant divines of the 16th century, such as Flacius, Rorarius (Rörer), Aurifaber (Goldschmid), and Amsdorf, who esteemed him for his extensive learning. He also became acquainted with the celebrated printer Hans Lufft, in whose office he was employed as corrector of the press for thirty-four years. He was the sub-editor of the Wittenberg edition of the works of Luther, which edition was attacked by the divines assembled at Jena for the purpose of publishing another edition; they charged Walther with having purposely altered several passages so as to make them an instrument in the hands of the Calvinists for their attacks against Luther. The celebrated Amsdorf (the bishop) attacked Walther in a pamphlet entitled 'Dass die zu Wittenberg im andern Theil der Bücher Lutheri im Buch, dass diese Wort, Das ist mein Leib, noch feste stehee, mehr denn ein Blat und 4 gantze Paragraphos vorstelich ausgelassen haben.' He was likewise attacked by Flacius. Walther was not the man to pass over such an accusation in silence; he defended himself in a pamphlet, 'Bericht von denen Wittenbergischen Tomis der Bücher des ehrwürdigen Martin Luthers, wider Matthes Flacium Illyricum,' 4to, Wittenberg, 1558. Meyerus, in his work, 'De Versione Bibliorum Lutheri' (a. 4. par. 53), says that the accusations directed against Walther were unfounded, though it appeared that the Wittenberg edition was incorrect. Amsdorf's reproach however to which the Jena edition was likewise liable. Another polemical pamphlet of Walther was, 1, 'Antwort auf die Flacianische Lügen und falschen Bericht wider die Haus-Postill Dr. Luthers.' He also wrote, 2, 'Bericht vom Unterschied der Biblien und anderer Bücher Lutheri:' 3, 'Register aller Bücher und Schrifften Lutheri, welche in die XI. Teutsche Theil und VII. Lateinische zu Wittenberg getruckt sind. Item, welche in dem 12ten Theil getruckt werden sollen, nach diesem Register verreichnet,' 4to, Wittenberg, 1558. Walther died about 1572, but Zeumer says that the precise date of his death has never been ascertained.

(Zeltnerus, *Theatrum Virorum Eruditorum*, p. 542, &c.; *Correctorum in Typographia Eruditorum Centuria*, p. 542, &c.)

WALTHER, CHRISTIAN, a German divine of considerable merit, was born in 1665, at Norkitten, not far from Königsberg, where he began his academic studies, which he continued at Leipzig, and finished at Jena. He took his degree of M.A. at Jena, in 1677, and returned to his native country, where he held several ecclesiastical offices. In 1701 he was chosen member of the Academy of Science at Berlin, and in 1702 the faculty of Frankfurt-on-the-Oder conferred upon him the title of D.D. In 1703 he was appointed ordinary professor of divinity in the University of Königsberg, and in the following year he was invested with the office of inspector of the synagogue of the Jews in that town. During some time he was Rector Magnificus of the University of Königsberg, where he died in 1717. His principal works are, 1, 'Tractatus de Cultu Divino sanctuarii Veteris Testamenti, quem stando fieri oportebat;' 2, 'De Duabus Tabulis Lapideis;' 3, 'De quatuor Poenarum generibus apud Hebraeos;' 4, 'Disputationes VIII. de Pluralitate personarum in Divinis, ex Genesi (i. 26);' 5, 'Disputationes III. de Ingressu Sacerdotis summi solenni Expiationis die in Sanctum Sanctorum;' 6, 'Programmata V. de Semine Abrahae in quo benedicuntur Omnes Gentes.' Walther also published the beginning of the work of Moses Maimonides on Circumcision, with notes and a Latin translation.

WALTHER, CHRISTOPH THEODOSIUS, was born at Schildberg, in Brandenburg, in 1699, and studied divinity at Halle. Frederic IV., king of Denmark, having applied to the faculty of Halle for the purpose of obtaining some young theologians who would go as missionaries to the Danish possessions in East India, Walther accepted the invitation. He went accordingly to Copenhagen in 1705, accompanied by Henry Plütschow and the celebrated Bartholomew Ziegenbalg. They arrived at Tranquebar on the 9th of July 1706, and until then the Danes had not succeeded in propagating Christianity beyond the narrow limits of their colony. Walther, after having learned Portuguese, with Tamul and several other Indian dialects, visited the whole coast of Coromandel, and his pious zeal was rewarded with great success. He founded the missionary establishment of Majuburam. From 1725 his health suffered much in consequence of an endemic fever. He returned to Europe in 1740. Before he reached Denmark, he died at Dresden on the 27th of April 1741. Walther published 'Nachrichten von den Tranquebarischen Missions-Wesen,' 1726; 2nd ed. 'Vey of Salvation,' in Tamul, Tranquebar, 1716, 1731: this work is sometimes cited under the title of 'Refutation of Mohemmedanism;' 'An Abridgment of Ecclesiastical History,' in Tamul, Tranquebar, 1735; 'Observationes Grammaticae quibus Linguae Tamulicae Idioma vulgare illustratur,' Tranquebar, 8vo, 1739; 'Doctrina Temporum Indica ex Libris Indicis et Brahmarum quos Ramiliponenis recentioribus,' in Bayer's 'Historia Regni Bactriani;' 'Ellipses Hebraicae, sive De Vocibus quae in Codici Hebraico per ellipsin suppriuntur,' published by Schötgen, Dresden, 8vo, 1740. Walther contributed to the Portuguese translation of the Bible, published for the coast of Coromandel and in the Portuguese colonies. (Niecampius, *Historia Missionis Evangelicae in India Orientali*; comp. Schötgen, *Commentarii de Vita et Agone Christiani Theodosii Waltheri*, Halle, 1743.)

WALTHER, GEORG CHRISTOPH, a German jurisconsult, was born in 1601, at Rothenburg, formerly an imperial town on the Tauber in Franconia. In 1620 he went to Strasburg, where he studied law, and in 1628 he took his degrees in law in the University of Altdorf. In 1631 the senate of his native town appointed him president of the chancery of justice, which office he held till his death, in 1656. As Walther was well acquainted with the public law of Germany, several princes and other members of the circle of Franconia employed him as their representative during the different diplomatical transactions which either preceded or followed the peace of Westphalia, in 1648. He wrote: 1, 'Methodus Jura Studendi;' 2, 'Liber de Statu, Juribue et Privilegiis Doctorum;' 3, 'De Metatis et Hospitationibus Militaribus;' 4, 'De Renunciatione Successionum vel Hereditatis;' 5, 'Harmonia Theologico-Juridico-Politico-Philosophica,' which was published after his death.

WALTHER, HEINRICH A'NDREAS, born in 1696, at Königsberg in Hesse, became minister at Worms in 1729, and in 1733 he was appointed minister at St. Catherine at Frankfurt-on-the-Main. In 1741 the senate and the protestant clergy at Frankfurt-on-the-Oder conferred upon him, and in the same year the faculty of Giessen created him doctor of theology. He died at Frankfurt in 1748. His principal works are: 1, 'Disputatio ex Antiquitate Orientali de Zabiis;' 2, 'Dissertatio de Dominio Dominis in Brute, ex officiis ejus in hujus Dominii proprietio observandis;' 3, 'Fiostemata de hac per Christum Lichte der Römisch-Catholischen Lehre, gegen ein von einem Jesuiten heraus gegebenes Büchlein, genannt Licht in der Finsternis;' 4, 'Exegesis Epistolae Judae;' 5, 'Erste Gründe der Weisheit und Tugend.' This book has been imitated by several later writers, and has given birth to an excellent work for the use of children, entitled 'Lehren der Weisheit und Tugend;' 6, 'Erläuterter Katechismus.' He edited and accompanied with a preface the 'Frankfurter Catechismus.'

WALTHER, MICHAEL, born in 1593, was the son of John Walther, a rich merchant and patrician at Nürnberg, who intended to bring his son up to his business, for which purpose he sent him to a rich merchant at Thas in Bohemia. Young Walther however disliked trade, and his father had him educated for a scholar. In 1610 Walther went to the university of Wittenberg, where he first studied medicine, but he afterwards pursued theological studies at Giessen, Altdorf, and Jena. In 1618, Elizabeth, Duchess of Brunswick-Wolfenbüttel, appointed him her chaplain: and in 1622 her son, Duke Julius Frederic, gave him a chair of divinity in the university of Helmstadt.

In 1626 Rudolph Christian, sovereign count of Ostfriesland, conferred upon him the dignity of general superintendent of the Lutheran church in his dominions. Several distinguished works on divinity which he published during the course of these years had made his name known in Germany, and the universities of Rostock and Wittenberg both offered him a chair of divinity, which however he declined. However in 1642 he accepted an invitation of Frederic, Duke of Brunswick-Lüneberg, who appointed him general superintendent of the Lutheran church in his duchy. He died at Zelle, on the 9th of February 1662. His principal works are :—1, 'Hanus et Lapsus Salomonis,' 4to, Emden, 1628; 2, 'Officina Biblica,' 4to, Nürnberg, 1636 & 4to, 1668. This book shows the extensive learning of the author, and is of importance with regard to the Apocrypha; it also gives information on several writings attributed to the Apostles which are not contained in the New Testament. 3, 'Harmonia totius Sacræ Scripturæ, sive Conciliatio Locorum Veteris et Novi Testamenti apparenter sibi contradicentium,' 4to, Nürnberg, 1637. This book ran through seven editions in the space of seventeen years. 4, 'Tractatus de Manna,' 12mo, Leiden, 1653; 5, 'Exercitationes Biblicæ,' 4to, Nürnberg, 1638; 6, 'Quadragena Miscellanearum Theologicarum;' this book was the forerunner of—7, 'Centuria Miscellanearum Theologicarum;' 4to, Nürnberg, 1646, in which the author discusses one hundred difficult questions concerning divinity. Similar works are :—8, 'Liber singularis Quæsitorum et Responsorum Theologicorum,' 4to, 1652; 9, 'Speciosiorum Controversiarum illustrium XXII. de Dei Nominibus;' 10, 'Postilla Mosaica, oder Erklärung etlicher Historien, Fürbilder, und Sprüche aus den Fünf Büchern Mosis;' 11, 'Postilla Evangelica,' &c.; 12, 'Der Gülden Schlüssel des Alten und der grosse Kern des Neuen Testaments, das ist, Gründliche Erklärung der tiefsinnigen Epistel S. Pauli an die Hebraeer;' this book was much esteemed. The learning of Walther was unanimously acknowledged, but the length of his works and his want of taste in the arrangement of his materials were condemned. Walther had a son, called MICHAEL WALTHER, like his father, who was born at Aurich in 1638, and who became professor of mathematics, and afterwards of divinity, in the university of Wittenberg, where he died in 1692. He published several good works both on mathematics and divinity. The principal are :—1, 'Disquisitio Mathematica de mutuis Siderum Radiationibus quas vulgo Aspectus vocant,' 4to, Wittenberg, 1660; 2, 'De Harmonia Musica;' 3, 'De Novo Legislatore Christo contra Sociianos et Arminianos;' several dissertations on comets, the golden number, the terrestrial zone, on progress, &c. &c.

WALTHER, or GUALTE'RUS, RUDOLPH, was born at Zürich in the year 1519. After having studied Protestant divinity in several schools in Switzerland, he went to Marburg in Hesse, and made himself known as a learned divine and an able negociator in those politico-theological transactions which, according to the circumstances, either troubled or quieted Germany during the 16th century. He accompanied the landgrave, Philip the Magnanimous, of Hesse, to the diet of Regensburg in 1541, and although he was rather young, the landgrave put him at the head of the German divines who were present at the diet. At Regensburg, Walter made the acquaintance of Melanchthon, Bucer, Sturm, and other eminent theologians. He returned to Switzerland in the same year (1541), and was appointed head-teacher of the Schola Carolina Turicensis; the following year (1542) he was chosen minister at St. Peter in that town, where he died in 1586. The principal works of Walther are :—1, 'Apologia Zvinglii.' Walther became soon an adherent of Zwingli, and more than once attacked Luther. 2, 'Monomachia de Goliathi;' this is a Latin poem written in Latin verse. 3, 'Homiliæ in totum Novum Testamentum,' published by Josias Simler, the divine, folio, Zürich, 1594. He has also written—4, 'Homiliæ in Joannis Epistolas : in 12 Prophetas Minores ; in Matthæum ; in Marcum ; in Lucam ; in Acta Apostolorum ; in Epistolam ad Romanos ; in Epistolam ad Corinthios ; in Epistolam ad Galatas ;' and a great number more. 5, 'Argumenta omnium tam Veteris quam Novi Testamenti Capitum;' the author has made these arguments the subject of an elegiac poem, written in Latin verse. 6, 'Nabales, Comœdia Sacra ex Samuele,' 1. c. 25; and several other Latin poems, among which there is one on the learning of the German nobility. 7, 'Apologia ad Catholicam Ecclesiam pro Ulrico Zvinglio, ejusdemque Operum Editione;' 8, 'Translatio Mosis Pe tatenchi, cum Argumentis, Dispositionibus, et Explicationibus ;' the whole of Ulrich Zwingli Libri XXIV.;' this is in Latin translation of Zwingli's sermons and other writings. 10, 'Wahrhaftig Bekenntnus des Kirchendieoates zu Zürch mit gebuhrender Antwort auf Lutheri Verdammnus und Schelten,' in German and Latin. Walther's name is mentioned among the most eminent German divines of the 16th century. Some say that the Latin version of the Bible by Vatablus (François Watebled, or Gastebled, who died in Paris in 1547, and who translated some books of Aristotle) is made by Walther.

WALTHER VON DER VOGELWEIDE, one of the most celebrated of the old German Minnesingers, was born sometime between 1165 and 1170. His birth-place is uncertain, but he was undoubtedly a German, and most probably an Austrian, as it was at Vienna, he himself tells us, that he acquired the art of poetry; and he there found his first patron in Duke Friedrich. His earliest poems were given to the world about 1187, and he continued to produce them until 1227. They are distinguished by a depth of feeling, a rich poetic colouring, a lively perception of the beauties of nature, a reverence for woman, devout aspirations, and a nervous masculine strength. They are by no means confined to minne, or love-songs. Though these preponderate in the early part of his career, in his riper years he took a lively interest in the welfare of his country, and in his songs and poems endeavoured to awaken the patriotic feelings of his countrymen. He exhorted them to support Philip of Swabia, as emperor, against Otto of Brunswick; he lamented over the disruption of the empire, and the decay of the old customs, discipline, and manhood; he complained of the endeavours of the pope to take advantage of the civil contests in Germany to extend the clerical powers; and he applied upon Philip to put an end to all this confusion. He was of knightly rank, and after the death of his first patron, Friedrich, he undertook a pilgrimage through Germany, at length took up his residence at the court of Hermann, landgrave of Thuringia, and is said to have taken a part in the poetical contest of the Meistersingers on the Wartburg. On the accession of Friedrich von Hohenstaufen in 1212, Walther was rewarded with a fief. In some of his songs he praised his patron's princely virtues, and exhorted him to repress the arrogance of the clergy; but though an opponent to the worldly ambition of the priests, he continued a pious adherent of the church. In 1228-9 he took part in the crusade of Friedrich II., and is supposed about the same time to have composed his poem of 'Freidank.' His death took place at Würzburg soon after his return, and his monument was for a long time shown in the burial-ground of the cathedral, but has now disappeared. By his contemporaries he was highly estimated; Gottfried of Strassburg in his 'Tristan' calls him the master of song.

Walther's works have been often reprinted. L. Uhland has written an interesting account of his life, and the character of his poetry, published in 1822. Lachmann has edited the poems accordingly well, twice, in 1827 and 1843; Karl Simrock has published a very successful translation of them from the old German, with explanatory notes by himself and Wackernagel, in 1833; and in 1843 they were again translated and annotated by F. Koch, from Lachmann's edition, wherein the earliest known copies of the original had been followed.

WALTON, BRIAN, a learned prelate of the English Church, and editor of the Polyglott Bible known by his name, was born in 1600, at Cleveland, in the North Riding of Yorkshire. He entered first Magdalen College, and afterwards Peter House, at Cambridge, and in 1623 took his degree of M.A. For a while he is said to have kept a school, and at the same time, or afterwards, to have served as curate in Suffolk; however he soon removed to London, where he acted as curate at Allhallows, Bread-street. He was then presented successively to the rectories of St. Martin's Orgar, in Candlewick ward, London, and Sandon in Essex; and before 1639, at which time he commenced D.D., he was prebendary of St. Paul's and chaplain to King Charles. During the early years of the quarrel between the king and the parliament, and the church and the puritans, Walton made himself very conspicuous in the suite between the clergy and the citizens respecting tithes and other ecclesiastical matters, and in other ways obnoxious to the winning party. On the ascendancy of the puritans he consequently was treated with much rigour. He was summoned before the bar of the House of Commons as a delinquant, his livings were requestered, and he himself was compelled to fly. He took refuge in Oxford, and there in 1645 he was incorporated D.D. At Oxford he formed the idea of his famous Polyglott Bible, and commenced the collection of the necessary materials; but it was not completed till some years after his removal to London, whither he was permitted to return on the death of the king.

Walton's Polyglott is in 6 vols. large folio. It was published by subscription (being, it is believed, the first book printed in England in that manner), and the volumes came out in the following order :—the first volume in September 1654, the second in July 1655, the third in May 1656, and the last three in 1657. "And thus," says Dr. Twells ('Life of Pocock'), "in about two years was finished the English Polyglott Bible, the glory of that age and of the English Church and nation, a work vastly exceeding all former attempts of that kind, and that came so near perfection as to discourage all future ones." Some portions of this Polyglott are printed in seven languages, or open at one view. No one book is given in nine languages, but nine languages are used in the course of the work, namely, Hebrew, Chaldee, Samaritan, Syriac, Arabic, Persian, Ethiopic, Greek, and Latin. A vast deal of learning is contained in the first volume, and the sixth is made up of various readings, critical remarks, &c. Brian Walton was assisted by a number of men who formed a constellation of Oriental and general scholars, such as perhaps have appeared together at no other period during the whole history of our country. One of these men was Dr. Edmund Castell, who published his 'Lexicon Heptaglotton' in 1669, 2 vols. folio. This is a lexicon of the seven Oriental languages occurring in Walton's Polyglott, and it has grammars of all these languages prefixed. It generally accompanies the Polyglott, which can hardly be pronounced complete without it. Walton's work is by no means equal in appearance to the three preceding Polyglotts (the Complutensian, the Antwerp, and the Parisian), but in point of solid usefulness to the biblical scholar it is far beyond any one of them. The eight volumes form an extraordinary collection of aids for studying the original scriptures. Its history is recorded at length in Archdeacon Todd's 'Memoirs of the Life and Writings of the Right Rev. Brian Walton, D.D., Lord Bishop of Chester,' 2 vols. 8vo, London,

Digitized by Google

1821; a work which comprises also notices of all Walton's coadjutors. Dr. John Owen having, in 1659, published some 'Considerations' on the Prolegomena and Appendix of the Polyglott, Walton published a reply, the ampla title of which will sufficiently explain the nature of the controversy:—'The Considerator Considered; or a brief view of certain Considerations upon the Biblia Polyglotta, the Prolegomena, and Appendix. Wherein, among other things, the certainty, integrity, and the divine authority of the original text is defended against the consequences of Atheists, Papists, Anti-Scripturists, &c., inferred from the various readings and novelty of the Hebrew points, by the author of the said Considerations. The Biblia Polyglotta and translations therein exhibited, with the various readings, Prolegomena, and Appendix, vindicated from his aspersions and calumnies; and the questions about the punctuation of the Hebrew text, the various readings, and the ancient Hebrew character, briefly handled,' 8vo, 1659. In 1655 Dr. Walton had published an 'Introductio ad loctionem linguarum Orientalium.'

Shortly after the Restoration Walton was appointed chaplain to the king, and in 1661 he was created Bishop of Chester. But his enjoyment of this honour was very brief. He was installed on the 11th of September, and he died soon after his return from the ceremony, at his house in Aldersgate-street, London, on the 29th of November 1661.

WALTON, IZAAK, the 'Father of Angling,' was born at Stafford, on the 9th of August 1593. The register of baptisms and burials supplies the name of his father, one Jervis Walton, who appears to have been of the rank of a yeoman. Nothing more is known of this person, except that he died in the year 1590-97, leaving his son Izaak, it is supposed, an orphan.

From the time of Walton's birth up to the age of twenty nothing is known of him. It is presumed that he was apprenticed to a relation of the same name who dwelt in Whitechapel, and is described as a sempster, or hosier, but the identity of trades seems to be the only ground for this conjecture. He must however soon after the age of twenty have been engaged in business on his own account; for in 1624 Sir John Hawkins states, on the authority of a deed in his possession, that 'Walton dwelt on the north side of Fleet Street, in a house two doors west of Chancery Lane, and adjoining on a messuage known by the sign of the 'Harrow,'' and that his house was then in the joint occupation of himself and a hosier called John Mason. About 1623 (a year before the date of this deed) Walton states that he first began "a long affinity" with the family of his first wife, Rachel Floyd, a descendant of Archbishop Cranmer. He was married to this lady on the 27th of December 1626.

It was doubtless owing to this marriage that Walton first became interested about Hooker, the author of the 'Laws of Ecclesiastical Polity,' George Cranmer, his wife's nephew, having been Hooker's pupil. Cranmer no doubt orally communicated the materials for the admirable Life of Hooker which Walton wrote during his residence with Dr. Morley in 1662: it was not however published until 1665.

We owe the Life of Dr. Donne to another local connection. Walton's house was situated in the parish of St. Dunstan in the West, of which Donne was vicar. A close intimacy ensued between them, and we find Walton attending, with other friends, on Donne's death-bed in 1631, and also that Walton wrote an elegy on his friend, which was printed at the end of Donne's poems published by his son in 1633. This elegy seems to be Walton's first avowed literary effort, and in it he speaks of Donne's "powerful preaching," and calls himself his "convert," which gives a clue to the intimacy between Walton and Donne. Sir Henry Wotton requested Walton to collect materials for a life of Donne, which Sir Henry himself had thought of writing, but his death in 1639 put an end to the design. Walton however, bearing that Dr. Donne's sermons were to be published without a prefatory life, determined on writing it himself, and in the introduction to the Life, published with the Sermons in 1640, he fully explains the reasons which induced him to become Donne's biographer.

Previous to this publication Walton had removed into Chancery-lane, a few doors from Fleet-street, where his wife gave birth to two sons, both of whom however died. In August 1640, soon after the birth of an infant daughter, his wife also died. These heavy afflictions seem to have had a great effect upon Walton, for in 1644 he left Chancery-lane, and up to the year 1651 his residence is wholly uncertain; all his publications during this period were two commendatory copies of verses, and an address to Quarles's 'Eclogues.' About 1647 he married Anne Ken, half-sister of the non-conformist bishop of that name. In 1648 he had a daughter born, and in 1650 a son, who died after a few months. Walton's fourth and surviving son, Isaac, was born in 1651. In this same year Walton published a collection of Sir Henry Wotton's letters, poems, &c., under the title of 'Reliquiæ Wottonianæ,' to which he prefixed the Life of Wotton. He is also believed to have edited 'The Heroe of Lorengee,' a translation from the Spanish of Gracian, by Sir John Skeffington, which appeared in 1652, and to which is prefixed a preface signed I. W., which bears all the marks of having proceeded from Walton's pen.

Walton had by his marriage connections identified himself with the Royalist party, and the strongly expressed approval of Charles I. of the 'Life of Donne,' combined with other circumstances, rendered him very zealous in a difficult and dangerous service which distinguished this period of his life; the 'Lesser George' having been confided to his care after the battle of Worcester, by Charles II., for safe conveyance to London. Ashmole details this service in his 'History of the Order of the Garter,' and declares that Walton was "well known, and as well beloved of all good men."

In 1653 the work upon which his fame principally rests appeared—'The Complete Angler, or Contemplative Man's Recreation,' a work which, to use the words of Sir Harris Nicolas, "whether considered as a treatise on the art of angling, or as a beautiful pastoral, abounding in exquisite descriptions of rural scenery, in sentiments of the purest morality, and in an unaffected love of the Creator and his works, has long been ranked among the most popular compositions in our language." In 1654 the second edition of the 'Reliquiæ' and in 1655 the second of the 'Angler' appeared. Between this period and 1658 all trace of Walton is lost. In 1658 Dr. Donne's Life was first published as a separate work. At the Restoration, two years afterwards, Walton testified his joy by addressing an 'Humble Eclogue' on the subject to Alexander Brome, printed with that writer's poems, and published in 1661.

During the troubled times preceding the Restoration, Walton had become intimate with Drs. Morley and Sanderson, who were now elevated to the respective sees of Worcester and Lincoln. Another friend of Walton's, Dr. King, was also reinstated in the see of Chichester. In 1662, having again become a widower, he left his residence, which appears to have been in Clerkenwell, and went to reside with Dr. Morley, who was just then made Bishop of Winchester. At this time also he took the lease of a house in Paternoster-row, called the Cross Keys, which was burned down in the great fire.

In 1670 the 'Life of George Herbert' was published, for the materials of which he was indebted to Dr. Henchman, Bishop of London. A collected edition of the 'Lives' also appeared at this time.

In 1673 Walton had the happiness of seeing his daughter Anne married to Dr. William Hawkins, prebendary of Winchester Cathedral. Walton's son is supposed to have been educated by his maternal uncle, Thomas Ken, also a prebendary of the same cathedral, for in 1675 we find them travelling abroad together, a tour on the Continent forming a regular part of the education of those days. Young Walton was soon after admitted at Christchurch, Oxford. In 1676 Charles Cotton, Walton's well-known coadjutor in the later editions of the 'Complete Angler' (Cotton contributing a treatise on fly-fishing to that work), comes into notice. [COTTON, CHARLES.] He built the fishing-house on the banks of the Dove, near his own house, Beresford Hall, and there Walton's old age found the ease and retirement which he so well deserved. In the year 1678 his last literary efforts appeared; the Life of his friend Bishop Sanderson, and an introduction to a poem by John Chalkhill, entitled 'Thwaina and Diarchea,' concerning which strange mistakes have been made. Many persons attributed it to Walton himself, but Sir Harris Nicolas has proved that the family of Walton's second wife intermarried with a family of this name, and through them the poem came into Walton's hands. An anonymous tract, printed in 1680, entitled 'Love and Truth,' is attributed to Walton, but upon slender authority. Walton died at the house of his son-in-law, during a severe frost, on the 15th of December 1683, and lies buried in Winchester Cathedral.

Walton's son became a canon of Salisbury Cathedral, and is said to have contributed largely to Walker's 'Sufferings of the Clergy,' and to have most hospitably received Bishop Ken when deprived of his bishopric. He died December 29, 1719, and Anne Walton in 1715. There are no descendants of the name of Walton living. A good portrait of 'Old Izaak,' by Houseman, was bequeathed by a descendant to the National Gallery.

There are many editions of the 'Complete Angler,' from that of 1653 to the present time. That of 1833 is a splendid work in two quarto volumes, edited by Sir H. Nicolas, who has written the first good Life of Walton. There was also an edition of all Walton's works by Major, in 1823. Dr. Zouch wrote a poor Life of Walton, prefixed to an edition of his 'Lives.'

WALWORTH, SIR W. [RICHARD II.]

WANLEY, REV. NATHANIEL, is the author or compiler of a work which first appeared in a folio volume in 1678, and has been often reprinted in various forms, entitled 'Wonders of the Little World.' The little world is the microcosm, man, and the work consists of a large collection of remarkable stories illustrative of human nature. They are selected however with no judgment: incredibilities and exploded fictions are as welcome to the omnivorous collector as the best established facts; and the book in truth is of little or no value. Wanley was born at Leicester in 1633, studied at Trinity College, Oxford, took his degree of B.A. in 1653, that of M.A. in 1657; seems then to have been appointed minister at Beeby in Leicestershire, which he was when he published at London, in 1658, a tract entitled 'Vox Dei, or the Great Duty of Self-Reflection upon a Man's own Ways;' afterwards became vicar of Trinity Church in Coventry, and died in 1680.

WANLEY, HUMPHREY, was the son of the Rev. Nathaniel Wanley, and was born at Coventry, 21st of March 1672. He is said to have been first intended for a limner, and afterwards to have been put to some trade; but he had been early smitten with a taste for the study of old books and other antiquities; and besides, he had

Digitized by Google

evidently a constitutional dislike or incapacity for any sort of regular occupation. Having however acquired a great skill in old handwritings (in the cultivation of which he may have been assisted by what he had learned of the art of limning), this accomplishment recommended him to the notice of Dr. William Lloyd, then Bishop of Lichfield and Coventry (afterwards of Worcester), and that prelate sent him to Edmund Hall, Oxford. He proved of great service to Dr. Mill, the principal, by the assistance he gave him in making his collation of the various readings of the Greek New Testament (published in 1707). After this he was taken into the service of Dr. Charlett, master of University College, who kept him at his own lodgings, and seems to have employed him in transcribing, compiling, abridging, and other such work. Charlett also got him appointed one of the under-keepers of the Bodleian Library; and he took a principal part in drawing up the Indexes to the Catalogue of Manuscripts, the Latin preface to which is of his composition. He then left Oxford, and removing to London, became secretary to the Society for Promoting Christian Knowledge. His next employment was as assistant to Dr. Hickes, the eminent Anglo-Saxon scholar, for whom he travelled over the kingdom in search of manuscripts in that language, and drew up in English the descriptive catalogue of those contained in the public and private libraries and other depositories visited by him, which, after it had been translated into Latin by another hand, was printed in Hickes's 'Thesaurus Linguarum Veterum Septentrionalium,' 3 tom., folio, Oxon., 1705, and forms the third volume of that great work. This is Wanley's principal performance; and it is admitted to be done, all circumstances considered, with diligence, care, and competent learning. His last employment was as librarian to Harley, earl of Oxford, the founder of that famous collection of printed books and manuscripts, and to his son, the second earl, both of whom were highly satisfied with his services in that capacity. He compiled the Catalogue of the Manuscripts, which was first printed in 1702, as far as to No. 2407. Among the Lansdowne manuscripts, in the British Museum, is a very curious Diary, kept by Wanley, from March 1715, till within a fortnight of his death, mostly of proceedings connected with the Harleian library. Several extracts from it are printed in Nichols's 'Literary Anecdotes of the Eighteenth Century.' The only separate work published by Wanley is a translation (from the French) of Osterrald's 'Grounds and Principles of the Christian Religion,' which appeared at London in an 8vo volume, in 1704.

Wanley was twice married; first to a widow with several children; the second time, only a fortnight before his death, to a very young woman. He was carried off by dropsy, 6th July 1726, when it was found that he had left all he had, which amounted to something considerable, to his widow.

There are many letters relating to Wanley, principally from his contemporary and fellow antiquarian Hearne, in the 'Letters of Eminent Persons of the Seventeenth and Eighteenth Centuries, from MSS. in the Bodleian,' published (by Dr. Bliss) in 3 vols. 8vo, in 1813. And there are several of Wanley's own letters in the volume lately printed for the Camden Society, entitled 'Original Letters of eminent Literary Men of the Sixteenth, Seventeenth, and Eighteenth Centuries, with Notes and Illustrations by Sir Henry Ellis, K.H., F.R.S.,' &c., 4to, 1843.

WANSLEBEN, JOHANN MICHAEL, son of a Lutheran clergyman, was born at Erfurt in 1635. After studying philosophy and theology at Königsberg, he was successively private tutor, soldier, and vagabond; at last he attached himself, for the purpose of studying the Ethiopic, to Ludolf, at whose request he undertook a journey to London. The object of this journey was to superintend the publication of Ludolf's 'Lexicon Ethiopicum,' which was published at London in 1661. Wansleben was also employed during his residence in England by Edmund Castell, as an assistant in compiling his 'Lexicon Heptaglotton.'

Wansleben, on his return to Erfurt, was sent by Duke Ernst of Gotha, at Ludolf's suggestion, to examine into the condition of the Christians in Egypt and Abyssinia. He performed the Egyptian part of the undertaking, but returned to Europe without attempting to penetrate into Abyssinia. He landed at Leghorn in February 1665, and proceeded to Rome, where he declared himself a convert to the Romish Church, and soon after entered the Dominican order. In 1670 he visited Paris, and was sent to Egypt by Colbert, for the purpose of collecting information respecting the state of the country and purchasing manuscripts. He landed at Damietta in March 1671, and left Cairo for Constantinople in September 1673. He visited in succession the Coptic convents of the Delta, the Faium, the deserts of St. Macarius and St. Anthony, in search of manuscripts, and ascended the Nile as far as Esneh. He made several excursions from Constantinople into Asia Minor, and was preparing to return to Egypt when he was recalled to France. He reached Paris in April 1676; but instead of obtaining the objects of his ambition, a bibliopric or professorship of Oriental languages, he was called to account for the moneys entrusted to his disposal, and disgraced for misapplying them. After soliciting in vain a grant of public money to enable him to print the Ethiopic works he had collected, his necessities obliged him to accept, in 1678, the office of vicar in a village near Fontainebleau, where he died, on the 12th of June 1679.

Ludolf, in the preface to his commentary on the 'History of Ethiopia,' speaks slightingly of Wansleben, but his opinion may have been influenced by the conduct of his former scholar; he must have entertained some respect for Wansleben's acquirements when he sent him to London to carry his Ethiopic Grammar and Lexicon through the press. The published works of Wansleben are—1, 'Index Latinus in Jobi Ludolfi Lexicon Æthiopico-Latinum; Appendix Æthiopico-Latina, Liturgiæ S. Dioscori, Patriarchæ Alexandrini, Æthiop. et Lat.,' 4to, Londini, 1661; 2, 'Conspectus Operum Æthiopicorum quæ ad excendendum parata habebat Wanslebius,' 4to, Paris, 1671; 3, 'Relazione dello stato presente dell' Egitto,' 12mo, Paris, 1671; 4, 'Nouvelle Relation, en forme de Journal, d'un Voyage fait en Egypte en l'Année 1672 et 1673,' Paris, 1677. This edition enters much more into detail than the Italian version: an English translation from the French was published at London in 1678. 5, 'Histoire de l'Eglise d'Alexandrie fondée par St. Marc, que nous appelons celle des Jacobites Coptes d'Egypte, écrite au Caire même en 1672 et 1673,' 12mo, Paris, 1677. This work professes to be a compilation from Coptic writers. Besides these, a manuscript account of Wansleben's first expedition to Egypt was transmitted to Gotha. Possibly the pamphlet published in London in 1679, entitled 'A Brief Account of the Rebellions and Bloodshed occasioned by the anti Christian practices of the Jesuits and other Popish Emissaries in the Empire of Æthiopia: collected out of a manuscript history written in Latin, by J. Michael Wansleben, a learned Papist,' may have been compiled from his narrative. A manuscript entitled 'Diarium concertatum A. J. M. Wanslebii, Commendatore Thuring, ab anno 1654,' is said to be preserved in the Ducal Library at Weimar.

(*Biographie Universelle*; *Büsches, Allgemeines Oekartes-Lexicon*; *Preface to Ludolf's Lexicon Heptaglotton*. and Ludolf's second edition of his *Æthiopic Grammar and Lexicon*; *Nouvelle Relation d'un Voyage fait en Egypte*, Paris, 1698.)

WARBECK, PERKIN. (HENRY VII.)

WARBURTON, ELIOT BARTHOLOMEW GEORGE, eldest son of the late Major G. Warburton, of Aughrim, county Galway, Inspector-General of Constabulary in Ireland, was born in 1810: he represented a branch of an old Cheshire family. He received his early education at home and under the care of a tutor; then entered Queen's College, Cambridge, but after his second term he migrated to Trinity, where he took his degree. He was subsequently called to the bar, but soon ceased to practise, and turned his attention to the care and improvement of his Irish estates. He first became known to the world as an author by his captivating work on the East and Eastern Travel, entitled 'The Crescent and the Cross,' which was first published in 1845. This work at once acquired unusual popularity, and is now (1857) in the 13th edition. It was followed in 1849 by his 'Prince Rupert and the Cavaliers,' a brilliant history and vindication of the gallant Prince, in which he so chivalrously distinguished himself in the war under Charles I. He next published 'Reginald Hastings,' a romance referring to and illustrative of the same period. Shortly afterwards he edited the 'Memoirs of Horace Walpole and his contemporaries.' His last work, which was published after his death, is entitled 'Darien, or the Merchant Prince;' it is a tale founded on the colony established about the middle of the 17th century by a Scottish adventurer named Paterson, on that portion of the northern coast of South America which abuts on the Isthmus of Panama, and is known by the appellation of the Darien. Mr. Eliot Warburton married a daughter of the late E. Grove, Esq., of Shenstone Park, Staffordshire, and niece of Sir E. Cradock Hartopp, Bart., by whom he left issue, two sons. He was lost in the ill-fated ship Amazon, which was burnt off the Land's End, January 4, 1852.

WARBURTON, WILLIAM, a very distinguished English prelate, was born on the 24th of December 1698, at Newark, and was the elder of the two sons of Mr. George Warburton, an attorney of that place, who held the office of town-clerk, and of Elizabeth, daughter of Mr. William Hobman, one of the aldermen of the borough. The family was originally from the county of Chester. Warburton's grandfather, also an attorney, who had taken the royalist side in the civil war, was the first of them that settled in Newark.

Warburton was but seven years old when he was only eight years old; so that the care of his education fell upon his mother, who was left with the charge of three daughters besides her two sons, and who survived her husband many years. Being designed for the profession of his father and grandfather, he received the usual grammar education, first at the school of Okeham in Rutlandshire, under Mr. Wright, who afterwards became vicar of Cambden in Gloucestershire, then at that of his native town, which was taught by a cousin of his own of the same name. On leaving school, in 1715, he was placed in the office of Mr. Kirke, an attorney, at East Markham in Nottinghamshire, with whom he continued till April 1719, when he set up in business for himself at Newark. But a love of reading and study had early taken possession of him: his professional success, probably impeded by these tastes, is supposed not to have been considerable; and at length, having made up his mind to enter the church, he received deacon's orders from Dawes, Archbishop of York, in 1723.

He now also published his first literary performance, a 12mo volume of 'Miscellaneous Translations, in prose and verse, from Roman Poets, Orators, and Historians.' In 1723 he received priest's orders from Gibson, bishop of London, and by the interest of Sir Robert Sutton,

Digitized by Google

to whom he had dedicated his book, was instituted to his first preferment, the small vicarage of Grymsby in his native county. It was in the end of this same year also that he came to London, and formed what we may call his first literary connexion, which was with Theobald, Concanen, and others, then chiefly held together and handed into a sort of confederacy by their common hostility to Pope, under the scourge of whose satire they had most of them smarted. Warburton entered into all the animosities of his associates, and in particular was unfortunate enough to indite an epistle to Concanen, dated January 2nd, 1726 (that is, 1727), in which he said that Dryden borrowed for want of leisure, and Pope for want of genius, and which, much to his annoyance, was published long afterwards, in 1766, by Akenside the poet, whom he had offended, from the original, discovered in 1750 by Dr. Gavin Knight of the British Museum, in fitting up a house in Crane-court, Fleet-street, where it is supposed Concanen had lodged. (See Akenside's 'Ode to Thomas Edwards, Esq.,' and Bucke's 'Life of Akenside,' pp. 149-171.) Warburton's connexion with Theobald at this time also led him to furnish some notes to that gentleman's edition of Shakspere, which appeared in 1733.

In 1727 Warburton published, in June, his 'Critical and Philosophical Enquiry into the Causes of Prodigies and Miracles;' and the same year his only contribution to the literature of his original profession, a treatise entitled 'The Legal Judicature in Chancery stated.' The latter work appeared anonymously, and is stated to have been undertaken at the particular request of Samuel Burroughs, Esq., afterwards a master in chancery, who put the materials into Warburton's hands. In Reed's 'Law Catalogue,' London, 1809, it is described as "said to be written by Master Spicer, but generally ascribed to Lord King."

In April 1728, Warburton's friend Robert Sutton, was placed in the king's list of masters of arts for creation at Cambridge, on his majesty's visit to the university; and in June the same year he was presented by the same friend and patron to the rectory of Burnt or Brant Broughton, near Newark. His next publication of any importance, and the first which made him generally known, did not appear till 1736—his famous treatise entitled 'The Alliance between Church and State; or, the Necessity and Equity of an Established Religion and a Test Law demonstrated from the Essence and End of Civil Society, upon the Fundamental Principles of the Law of Nature and Nations.' This work equally startled and offended one party by its conclusions and their opponents by its mode of arriving at them; but it has come, we believe, to be very generally accepted by moderate churchmen as the soundest vindication of national religious establishments. It was described by Bishop Hurd, half a century after its appearance, as "one of the finest specimens that are to be found, perhaps, in any language, of scientific reasoning applied to a political subject."

In January of the following year 1738, Warburton published the first volume, containing the first three books, of his great work, 'The Divine Legation of Moses demonstrated on the Principles of a Religious Deist, from the Omission of the Doctrine of a Future State of Rewards and Punishments in the Jewish Dispensation.' It immediately, as was to be expected, raised a storm of controversy, which lasted for many years, and in the course of which the author had to defend himself against Drs. Stebbing, Sykes, Pococke, R. Grey, Middleton, and other assailants, in some respects agreeing as little among themselves as with the common object of their attacks. Warburton treated them all, Middleton alone excepted, much as a schoolmaster might treat so many of his pupils who should have ventured to enter into a dispute with him or to clamour against his authority.

The leading idea of this 'Divine Legation' is, that so important a doctrine as that of a future state, which must be regarded as the chief natural cement and bond of human society, could not possibly have been dispensed with in any scheme of mere human legislation, and that hence the Mosaic dispensation, in which according to Warburton's view, it is omitted, must have come from heaven, and must also have been maintained in a peculiar manner by a divine or miraculous influence. Whatever other merit it had, or had not, this view was at least undeniably a new one; and it was developed by its author with an ingenuity, a fulness and variety of learning, and an unflagging animation, such as certainly never had been combined before, and perhaps have not been exhibited together since, in any English theological work. But in truth mere theological discussion forms only a small portion of the book: the author is continually making excursions from the straight path of his argument, and in this way the reader is conducted, in the course of their journey together, over some of the most interesting fields of literature and philosophy.

A second edition of the first volume of the 'Divine Legation' was called for before the end of the year in which it first came out. A second volume, containing the fourth, fifth, and sixth books appeared in 1741. The first three, enlarged and divided into two volumes, was published for the fourth time in 1755; and a new edition of the second, similarly extended, appeared in 1758. In a third edition, which appeared in 1765, this second part of the work was extended to three volumes; so that the whole now consisted of five volumes.

Meanwhile the author had also been engaged in a variety of other labours, and had moreover improved his fortunes in more ways than one. Shortly after the appearance of his first volume, in 1738, he was appointed chaplain to the Prince of Wales. The following year six letters which he published in 'The Works of the Learned,' in defence of the orthodoxy of Pope's 'Essay on Man,' against the attacks of M. de Crousaz, introduced him to the acquaintance of Pope, who proved, for the few years that he lived after this, the steady and zealous friend of his voluntary champion. A seventh letter, "by the author of the 'Divine Legation,'" completed the vindication of the poem, in June 1740; and when Pope died, in May 1744, it was found that he had left Warburton half his library, with the property of all such of his works already printed as he had not otherwise disposed of, and all the profits which should arise from any edition to be printed from his effects for the next ten years. Bolingbroke, to the preface to his 'Idea of a Patriot King,' having charged his late friend Pope with having clandestinely printed an edition of that work some years before without his, the author's, leave or knowledge, Warburton is believed to have been the writer of 'A Letter' addressed to Bolingbroke, which immediately appeared in vindication of the deceased poet, and which Bolingbroke soon afterwards replied to in what he called 'A Familiar Epistle to the most Impudent Man living.' Warburton and Bolingbroke had once been introduced to each other by Pope, but parted with feelings of mutual disgust; and it is probable that Pope's intimacy with Warburton in his last days contributed to alienate him from his older friend.

One of the most important services which Warburton owed to Pope, was his introduction to the house of Ralph Allen, Esq., of Prior Park, near Bath. This led to his marriage, in December 1745, with Allen's niece, Miss Gertrude Tucker, in whose right, on Allen's death, in 1764, he became proprietor of Prior Park.

Sundry single sermons which he published from time to time must be passed over without notice. It may be mentioned however as illustrating the versatility of his powers, that one of his productions in 1742 was a 'Dissertation on the Origin of Books of Chivalry,' which appeared at the end of the Preface to Jarvis's translation of 'Don Quixote,' and which Pope soon after told him he had immediately recognised to be his, exclaiming, before he had got over two paragraphs of it, "Aut Erasmus, aut Diabolus." The same year he published 'A Critical and Philosophical Commentary on Mr. Pope's Essay on Man.' He also persuaded Pope to substitute Colley Cibber for Theobald as the hero of the 'Dunciad,' and to complete that poem by the addition of a fourth book.

In April 1746, Warburton, whose literary reputation was now very great, was unanimously elected preacher of Lincoln's Inn. Besides many controversial tracts and other minor pieces, the following eight years of his career produced his edition of Horace, Lond., 8 vols. 8vo, 1747 (a performance which did him little credit); his 'Julian, or a Discourse concerning the Earthquake and Fiery Eruption which defeated the Emperor's Attempt to rebuild the Temple at Jerusalem,' 1750; his (a treatise of remarkable ability, occasioned by Middleton's 'Enquiry concerning the Miraculous Powers'); his edition of Pope's Works, with Notes, in 9 vols. 8vo, 1751; two volumes of Sermons preached at Lincoln's Inn, under the title of 'The Principles of Natural and Revealed Religion occasionally opened and explained,' 8vo, 1753 and 1754; and 'A View of Lord Bolingbroke's Philosophy, in Four Letters to a Friend,' published, in two parts, in 1754 and 1755.

In September, 1754, Warburton was appointed one of his majesty's chaplains in ordinary; and the next year he was presented to one of the rich prebends of Durham. About the same time the degree of D.D. was conferred upon him by Archbishop Herring. In October 1757, he was admitted to the deanery of Bristol; and in the end of the year 1759 he was made Bishop of Gloucester.

His principal literary productions after this date were a little work against Methodism, in 2 vols. 12mo, entitled 'The Doctrine of Grace, or the Office and Operations of the Holy Spirit vindicated from the Insults of Infidelity and the Abuses of Fanaticism,' 1762; several tracts published in the course of a controversy in which he became involved with Dr. Lowth in consequence of some reflections he had made on the character of Lowth's father in the 1765 edition of the second part of his 'Divine Legation;' and a third volume of Sermons in 1767. His last publication was 'A Sermon preached at St. Lawrence Jewry, on Thursday, April 30th 1767, before his Royal Highness Edward Duke of York, president, and the governors of the London Hospital,' 4to, 1767. Not long after this his energetic and fervent faculties began gradually to lose their tone, till he sank at last into a state of intellectual slumber or torpor; not however, it is said, unrelieved by occasional though rare and brief returns of his former cheerfulness and even mental vigour. His death took place on the 7th of June 1779, not long after the death of his only son, who was carried off by consumption in early manhood. He left no other child, and his widow, in 1781, married Sir Rev. John Stafford Smith, who had been her first husband's chaplain, and who thus became owner of Prior Park.

A complete edition of the works of Bishop Warburton was published in 1788, by his friend Bishop Hurd, in 7 vols. 4to, at the expense of Mrs. Smith; and in 1794 Hurd added what he called 'A Discourse, by way of general Preface' to this edition, 'containing some Account of the Life, Writings, and Character of the Author.' Meanwhile the late Dr. Parr, with no friendly purpose, had supplied the deficiencies of Hurd's collection by the publication, in 1789, of an 8vo volume of 'Tracts, by Warburton, and a Warburtonian (Hurd

Digitized by Google

himself), not admitted in their works.' An 8vo volume of 'Letters from Warburton to one of his Friends' (Hurd), appeared in 1809; and in 1841 another 8vo volume was published by Mr Kilvert, entitled 'Literary Remains of Bishop Warburton.' But many letters of Warburton's, and also anecdotes of his life, which have not been collected, are to be found scattered over various publications. A portion of his correspondence which is not much known is contained in the 'Account of the Life and Writings of John Erskine, D.D., late one of the ministers of Edinburgh,' by Sir Henry Moncrieff Welwood, Bart., D.D., Edinb., 8vo, 1818, pp. 42-84 and 164-186.

* WARD, EDWARD MATTHEW, R.A., was born in Pimlico, London, in 1816. His early inclination for art was carefully fostered by his parents. In 1835 he entered the Royal Academy as a student, under the auspices of Wilkie and Chantrey. In the same year he exhibited his first picture, 'Mr. O. Smith as Don Quixote,' at the Gallery of the Society of British Artists. In 1836 he went to Rome, where he remained three years, and on his way home made a brief stay at Munich, in order to study fresco-painting under Cornelius. At Rome in 1838 he gained a silver medal given by the Academy of St. Luke, for a picture of 'Cimabue and Giotto,' which was exhibited at the Royal Academy on his return to England in 1839. The next year he sent a 'King Lear' to the Academy exhibition; in 1841, 'Thorwaldsen in his Study at Rome,' and 'Cornet Joyce seizes the King at Holmby, June 3, 1647;' and in 1842, 'Queen Elizabeth, wife of Edward IV., delivering the young Duke of York into the hands of Bourchier, archbishop of Canterbury, and Rotheram, archbishop of York, at the Sanctuary at Westminster.' But his abilities had as yet scarcely obtained recognition; and in 1843 he was unsuccessful in a more direct manner, in competing, at the Westminster Hall, size, which he sent to the cartoon competition at Westminster Hall, gaining neither prize nor praise. He found however where his strength lay. A picture of 'Dr. Johnson perusing the manuscript of the "Vicar of Wakefield,"' which appeared at the Academy in the same year, caught alike the eye of the critic and of the public. The painter had told in a plain, lively way on excellent and characteristic story of two of our best-known literary men, and its skilful treatment secured the suffrage of those whom the subject had attracted. He followed it up the next year by a 'Scene from the early life of Goldsmith,' and 'La Fleur's departure from Montreuil.' In 1845 appeared another capital picture—a 'Scene in Lord Chesterfield's Ante-room in 1748.' 'The Disgrace of Lord Clarendon,' which was exhibited in 1846, was of a more elaborate character, and altogether of a higher order of merit. Among later contributions to the Exhibitions of the Royal Academy have been 'The South Sea Bubble, a scene in 'Change Alley'—a picture displaying alike observation, humour, and deep feeling—in 1847; in 1848, 'Highgate Fields during the great fire of London in 1666,' and an 'Interview between Charles I. and Nell Gwy ane, as witnessed by Evelyn;' 'Benjamin West's first effort in Art,' and 'Daniel Defoe and the manuscript of Robinson Crusoe,' in 1849; 'James II. in his palace at Whitehall receiving news of the landing of the Prince of Orange,' and 'Jacobite hanging,' in 1850; in 1851, 'Thos Royal Reader,' 'John Gilpin delayed by his customers,' and 'The Royal Family of France in the prison of the Temple,'—which exhibited, like all these French pictures, a depth of pathos hardly to be found in any other of his works, 'The Last Sleep of Argyle' excepted;' 'Charles Lamb going to Execution' in 1852; 'The Execution of Lady Jane Grey going to Execution' in 1853; 'The Last Parting between Marie Antoinette and her Son,' and 'Byron and Mary Ivey,' in 1854.

Mr. Ward had competed unsuccessfully for one of the prizes offered by the Fine Arts Commissioners in 1843, but ten years later (1853) the Commissioners invited him to paint some pictures for the palace of Westminster, and he agreed to paint eight—of which he has already completed five or six—the first being his 'Last Sleep of Argyle,' one of the most masterly works of its class which has been produced by the English school. Mr. Ward is a painter of great power. His pictures display originality of conception; a happy and natural disposition of the figures; a direct and manly way of telling his story; true and characteristic, yet wholly unexaggerated expression; clear and forcible colouring; and in costume, scenery, and general details much and careful research. It may be that his pictures as a whole, are somewhat wanting in simplicity and spontaneity, but he is a thoroughly conscientious painter, and year by year his style improves.

Mr. Ward was elected an associate of the Royal Academy in 1847, and R.A. in 1855. His wife, * Mrs. Henrietta Ward, granddaughter of James Ward, R.A. (the subject of the following article), is also a painter of very considerable ability. She has exhibited at the Royal Academy, 'Result of an Antwerp Marketing,' in 1850; 'The Pet Hawk,' and 'Rowena, from Ivanhoe,' in 1851; 'Antwerp Market,' in 1852; 'The young May Queen,' in 1853; 'Scene from the Camp at Chobham,' in 1854; 'The Morning Lesson,' in 1855; 'The Intruders,' and the 'May Queen,' in 1856; and 'God save the Queen,' in 1857; several of which have deservedly attracted much attention.

WARD, JAMES, R.A., was born in Thames-street, London, in October 1770. He was apprenticed to an elder brother, a mezzotint engraver, and a pupil of Smith; but preferring painting, he taught himself to paint by a careful study and imitation of the works of George Morland. So closely indeed did he in his early pictures imitate Morland's manner, that, according to Dayes, the picture-dealers used to purchase his pictures at a low price, and having inserted Morland's name, sell them at a greatly increased rate as the genuine works of that master. It would seem from Mr. Ward's autobiographical sketch (printed in the 'Art Journal' for June 1849) that an active export trade in these 'Morlands' was for some years carried on with Ireland. Competent judges have declared that these early works were in truth scarcely if at all inferior to Morland's in their technical qualities, while they were purer and fresher in feeling, and equally true to nature; so that the purchasers were deceived, perhaps, after all, rather gainers than losers by the deception. 'A Bull Bait,' one of his early efforts, was considered a work of rare promise. But though, as a matter of choice, he continued to paint, for many years he found it necessary to engrave, and in January 1794, he was appointed 'painter and engraver to the Prince of Wales,' afterwards George IV. As soon as he could do so however, he laid aside the 'scraper,' and thenceforward wrote himself painter only. For many years he was in great request as a painter of portraits of favourite horses, high-bred bulls and cows, and the like; his spare hours being given to works of a more ambitious class, and of a large size, in which however animals were the chief actors—such as his life-size 'Horse and Serpent;' his large landscape of 'Deer Stalking;' his 'Bulls fighting across a tree at Sir Abraham Hume's,' and the 'Fall of Phaeton.' The last was but too clear an emblem of the painter's fate. He could handle cleverly enough his horses and steers on this lower world, but he was ambitious to soar into "the highest heaven of invention." In an evil hour the British Institution offered a premium of 100*l.* for a design illustrative of the battle of Waterloo. Ward sent in a sketch to which the premium was awarded, and the directors gave him a commission to expand it into a "national picture" for Chelsea Hospital. The result was an enormous 'Battle of Waterloo—an Allegory.' When finished an exhibition was made of it at the Egyptian Hall, to which nobody would go; and it was then hung up at Chelsea Hospital, but after enduring for a season the scoffs alike of the learned and the ignorant, the allegory was taken down, and rolled up, and laid aside to rot. From historical he travelled into theological allegory, which, as might be expected, no more success, his education (or want of it) and his turn of mind entirely disqualifying him for success in the higher branches of art. But happily he did not give over painting scenes of rustic and animal life, and though for his own pleasure, or from a sense of duty, he would persist in painting such subjects as the 'Triumph over Sin, Death and Hell;' or such still more unpromising themes as 'Ignorance, Envy, and Jealousy, filling the throat and widening the mouth of Calumny,' or adventuring to represent the 'War of Bad Emblems;' he yet failed to admirers with his bold and vigorous representations of a 'Landscape with Cattle,' a 'Council of Horses,' and the like. His largest and most characteristic picture of this class, 'Bull, Cow, and Calf,' painted in avowed rivalry with Paul Potter's 'Bull,' formed in the present year a notice-able feature among the modern pictures in the Art-Treasures Exhibition at Manchester. Holding on his own way, Mr. Ward continued, through evil and through good report, to paint without any abatement of spirit, though necessarily some loss of skill, long after he had passed his eightieth year. In fact, 1856 was the first year in which the exhibitors at the Royal Academy did not contain some new specimen of the veteran's pencil. [*See* Supplement.]

WARD, JOHN, LL.D., was born in London in 1679, and was one of the fourteen children of a dissenting minister of the same name, who was originally from Tysoe in Warwickshire, and died in 1717, leaving of this numerous family only this son and a daughter. Ward held the situation of clerk in the navy-office till 1710, when he opened a classical school in Tenter Alley, Moorfields. His first publication was a small octavo tract in Latin, on the elegant and powerful arrangement of words in sentences, which appeared in 1712. He appears to have continued to teach his school till September 1720, when he was elected professor of rhetoric in Gresham College. This appointment he held till his death October 31st, 1758.

Ward was from the beginning a leading member of a society of gentlemen, mostly divines and lawyers, who, with occasional interruptions, met once a week from 1712 to 1742, to discuss in written discourses questions of civil law and the law of nature and nations. In 1723 he was elected a Fellow of the Royal Society, and in 1736 a member of the Society of Antiquaries. In 1750 the degree of LL.D. was conferred upon him by the University of Edinburgh. In 1753, on the establishment of the British Museum, he was elected one of the trustees.

His principal publications, besides the tract already mentioned, were—a Latin translation of Dr. Mead's 'Discourse of the Plague,' which appeared in 1723; a treatise, in Latin, on the principles of Punctuation, appended to an edition of the 'Elementa Rhetorices' of Vossius, printed at London in 1724; a new and very correct edition, with a learned preface, of Lily's Latin Grammar, in 1732; an edition of Maximus Tyrius, published in 4to in 1740 by the Society for the Encouragement of Learning, of which he became a member in 1736; 'Lives of the Professors of Gresham College,' folio, London, 1740; a new edition of Camden's Greek Grammar, 1754; and 'Four Essays

Digitized by Google

upon the English Language,' 1758. After his death appeared his 'System of Oratory, delivered in a course of Lectures publicly read at Gresham College,' 2 vols. 8vo, 1758; and his 'Dissertations upon several Passages of the Sacred Scriptures,' 8vo, vol. i. 1761, vol. ii. 1771. He is also the author of many papers in the 'Philosophical Transactions,' and of some in the 'Archæologia.' His literary assistance was also liberally contributed to the publications of several of his contemporaries; such as to Ainsworth's 'Monumenta Kempiana,' 1720, for which he supplied an elaborate dissertation on the Romae As and its parts; an essay on the vases, lamps, rings, and clasps of the ancients, &c.; to Horsley's 'Britannia Romana,' 1732, for which he wrote an 'Essay on Peutinger's Table, so far as it relates to Britain;' to Buckley's edition of De Thou, 1733, for which he translated Buckley's three epistles to Dr. Mead into Latin; to Ainsworth's Latin Dictionary, both the first and subsequent editions; to the edition of Ælian's 'History of Animals,' published by Abraham Gronovius, in 1744; to the edition of Volusenus, 'De Animi Tranquillitate,' published by Principal Whitefoord of Edinburgh in 1751; to Pine's engraved Horace, 1753-57, &c. There are several letters to and from Dr. Ward in the 'Original Letters of Eminent Literary Men, with Notes by Sir H. Ellis,' printed by the Camden Society, 4to. London, 1843.

WARD, ROBERT PLUMER, was the sixth son of Mr. John Ward, a Spanish merchant resident at Gibraltar, who had married a Miss Raphnel, a Spanish Jewess; and was born on the 19th of March 1765. He was educated at a small school at Walthamstow, and at Christchurch, Oxford, under Dr. Cyril Jackson. He was called to the bar at the Inner Temple in 1790, and practised on the Northern Circuit without much success, he seemed employment in cases before the Privy Council. In 1805 he was appointed by Mr. Pitt one of the Welsh judges, but soon afterwards retired from the legal profession in order to undertake the more congenial duties of under-secretary of state for Foreign Affairs. From 1807 till 1811 he was a Lord of the Admiralty under the late Lord Mulgrave and the Right Hon. Charles Yorke; he served the office of Clerk of the Ordnance from the latter date till 1823, when he was appointed one of the auditors of the Civil List—a post which has since been abolished. He served as high bailiff for the county of Herts in 1832, and for many years held a seat in parliament, which he entered in 1802 as member for Lord Lonsdale's pocket borough of Cockermouth, and subsequently for the since disfranchised constituency of Blastemere. Amongst all his political and official duties, Mr. Ward found time and leisure for the composition of several works of history and of fiction. Of the former, the best known is his 'History of the Law of Nations in Europe from the time of the Greeks and Romans to the age of Grotius,' which was published in 1795, and was much praised for its research, its depth of view, and soundness of principle. Of his novels, 'Tremaine' and 'De Vere' are those which have attained the widest circulation. The former was published anonymously in 1825, and the latter in 1827. His other works are—'An Inquiry into the Conduct of European Wars,' 1803, a pamphlet which first established on his side the patronage and favour of Pitt; 'Illustrations of Human Life,' 1837; 'Pictures of the World,' 1838; an 'Historical Essay on the Revolution of 1688,' 2 vols. 8vo, 1838; and, lastly, 'De Clifford,' a novel, published in 1841.

From the middle of 1809 till late in life Mr. Ward kept a political diary, which has since been published down to the year 1820. It is valuable as an historical document, and as throwing some light on the state of things under the Perceval and Liverpool administrations. Mixing largely with the world of political and fashionable life, equally skilful in gathering and prompt in recording the gossip of the day, Mr. Ward was able to collect many really curious public facts relating to Canning, Castlereagh, the much debated question of the Regency, and the proceedings against Queen Caroline, which are not to be found in any other publication. The later portion of the 'Diary' is at present withheld from publication, owing to the warmth of its political partisanship and the severity of its comments on living statesmen. The 'Diary' will be found in the 'Memoirs of the Political and Literary Life of Robert Plumer Ward, Esq.' published in 1850 by his friend and relative the Hon. Edmund Phipps, 2 vols. 8vo.

Mr. Ward was thrice married: first, in 1796, to a daughter of C. J. Mulling, Esq., by the Dowager Countess of Mulgrave; secondly, in 1828, to Jane, daughter of the Hon. and Rev. George Hamilton, son of the seventh Earl of Abercorn (by his countess Anne, daughter of Colonel John Plumer, M.P. for Herts in the 17th century), and in consequence assumed the additional name and arms of Plumer; his third wife was a Mrs. Okeover, a daughter of the late General Sir George Anson, G.C.B. He had the misfortune to see nearly all his children carried off by consumption, with the exception of his only son by his first wife, now Sir Henry George Ward, noticed below. He died at Okeover Hall, on the 13th of August 1846.

WARD, SIR HENRY GEORGE, G.C.M.G., is the only son of the late Robert Plumer Ward, Esq., by his first marriage. He was born about the year 1798. He was appointed attaché at Stockholm in 1816, and was for some time in charge of that mission; in 1813 he was transferred to the Hague, and in the following year to Madrid. In November 1823 he went to Mexico with the first commission, and was British minister in that country from 1825 to 1827. In 1832 he entered parliament in the Liberal interest, as member for the since disfranchised borough of St. Albans, which he continued to represent till the dissolution consequent upon the death of William IV. in 1837, when he was elected for Sheffield. This constituency he represented down to the month of May 1849, when he was appointed Lord High Commissioner of the Ionian Islands, and received the honour of knighthood. During the last three years of his parliamentary life he held the post of secretary to the Admiralty under the late Earl of Auckland and Sir T. F. Baring, successively first lords of that department. Soon after entering parliament, Mr. Ward had been appointed minister-plenipotentiary for acknowledging the newly formed republic of Mexico. His long absence from England in this capacity caused him at first to be indefinite in the declaration of his political opinions; but in 1834 he distinguished himself by opposition for the reform of the Irish Church Establishment, which was the immediate cause of the political changes which took place in that year, and of the new organisation of the government. In 1835 he declared himself in favour of the ballot, triennial parliaments, and household suffrage. He was appointed governor of the Ionian Islands in 1849; and in that position very highly distinguished himself by his firm, yet considerate and liberal conduct under somewhat trying circumstances. He was promoted in 1856 from the government of the Ionian Islands to the governorship of Ceylon, which he at present (1857) holds. He is married to a daughter of Sir John Edward Swinburne, Bart., of Capheaton, county Northumberland. [See SUPPLEMENT.]

WARD, SETH, an English divine and astronomer of the 17th century, was born at Buntingford in Hertfordshire, in 1617, and there received the rudiments of his education. He was sent from thence to Sydney Sussex College, Cambridge, where he applied himself particularly to the study of mathematics, and of that college he subsequently became a fellow. Eight years after his admission he incurred the censure of the vice-chancellor for having, in his character of prevaricator, or public jester, exercised too much freedom in his language: the censure was however reversed on the following day.

On the breaking out of the civil war, Mr. Ward, having refused to subscribe the "solemn league and covenant" for the abolition of episcopacy, &c., and being engaged with other persons in drawing up a treatise against the covenant, was deprived of his fellowship: he continued however to reside at the college till 1643, when he removed to the neighbourhood of London. He spent some time at Aldbury in Surrey, in company with Mr. Oughtred, and the two mathematicians prosecuted together their favourite study; he afterwards accepted the offer of his friend Mr. Ralph Freeman to become the tutor of his sons, and he lived in the house of that gentleman at Aspenden in Hertfordshire till the year 1649, when he became domestic chaplain to Thomas Lord Wenman, who resided at Thame in Oxfordshire.

In the same year the parliamentary commissioners, at their visitation of the University of Oxford, removed from their posts the Savilian professors both of astronomy and geometry; when Mr. Greaves, who had held the chair of astronomy, recommended Mr. Ward to be his successor: the recommendation was attended to, and at the same time Mr. Wallis was appointed to the chair of geometry. On this occasion Mr. Ward took the oath of allegiance to the commonwealth, a step for which, on the restoration of the monarchy, he incurred considerable obloquy: he exerted himself however to revive the astronomical lectures, which had been for some time neglected; and by his industry and talents he brought them into great repute. In 1654 he took the degree of doctor in divinity, and, five years afterwards, he was made principal of Jesus College: he was subsequently chosen president of Trinity College, but these posts he was obliged to relinquish at restoration. While Dr. Ward resided at Oxford he associated himself with the eminent men of the time, and particularly with his friend Dr. Wilkins, at the apartments of the latter in Wadham College: from these meetings arose the Royal Society, of which he became a fellow in 1661.

Though Dr. Ward had held appointments under the government of Cromwell, it was well known that his sentiments were always in favour of monarchy; and accordingly, through the interest of the Duke of Albemarle and the Earl of Clarendon, he was appointed, in 1660, to the rectory of St. Lawrence, Old Jewry. In the same year he was made precentor of the cathedral of Exeter; in the year following he was appointed dean; and in 1662, bishop of the diocese. Five years afterwards he was translated to the see of Salisbury; and in 1671 he was made chancellor of the Order of the Garter: through his representations this honour was permanently attached to the see. In 1660 Dr. Ward had a violent fever, which, though he recovered from it, seems to have undermined his constitution: as he advanced in life the weakness returned, and he gradually lost the use of his faculties. He died January 6, 1689, in the seventy-second year of his age.

Bishop Ward was a man of great benevolence: in 1682 he founded at Salisbury a college for ten females, widows of orthodox clergymen; and at Buntingford, where he was born, he founded an hospital for the poor. He is accused of having been in some respects a time-serving man; and, though his disposition was humane, he lent himself readily to an order from court, by which he was enjoined to suppress the religious services of the nonconformist ministers in his diocese. In the House of Lords he was distinguished alike for the soundness of his arguments and his power as an orator.

His theological works are, 'An Essay on the Being and Attributes

Digitized by Google

of God; on the Immortality of the Soul,' &c., 8vo, Oxford, 1652; and a volume of Sermons, which was published in London in 1674; but he is chiefly distinguished by his works on astronomy. The first of these is entitled 'Prælectio de Cometis; ubi de Cometarum naturâ disseritur, nova Cometarum Theoria,' &c., with a tract designated 'Inquisitio in Ismaelis Bullaldi Astronomiæ Philolaicæ fundamenta,' 4to, Oxonii, 1653. In this work Ward criticises the hypothesis of Bullaldus, that the elliptical movement of a planet results from the path of the latter being on an epicycle whose centre is in motion, in a contrary direction, on an excentric deferent. In the following year were published also at Oxford, 'Idea Trigonometriæ Demonstratæ in usum Juventutis;' and a reply to John Webster, under the title 'Vindiciæ Academiarum,' 4to. In 1656 were published his 'Exercitatio Epistolica in Thomæ Hobbesii Philosophiam ad D. J. Wilkins,' and also his work entitled 'Astronomia Geometrica, ubi Methodus proponitur qua Primariorum Planetarum Astronomia, sive Elliptica, sive circularis, possit Geometricè absolvi,' 8vo, Londini. In the latter the author assumes the truth of an hypothesis which had also been proposed by Bullaldus, that each planet moves about the sun in an elliptical orbit, and that the revolving radii describe angles with a uniform motion, not about the focus which is occupied by the sun, but about that which was called the upper focus, being that through which was supposed to pass the axis of the cone, of which the ellipse is the section; and he founds on the hypothesis methods of calculation which he conceives to be more accurate and simple than those of Bullaldus. The hypothesis just mentioned was the last of those in which it was attempted to retain a uniform motion in some part of the system of a planet; and being capable of affording facilities in the determination of the true from the mean anomaly, it was adopted by other astronomers in that century; but however on a false foundation in fact, and has been long since abandoned by astronomers.

WARDLAW, RALPH, D.D., was born at Dalkeith, in the county of Mid-Lothian, Scotland, on the 22nd of December 1779. His father, William Wardlaw, was by business as a merchant, his mother, Anne Fisher, was daughter of James Fisher, a grandaughter of Ebenezer Erskine, two of the founders of the Scotch Secession Church. Ralph received his early education at the public schools of Glasgow, to which city his parents removed shortly after his birth. He entered the University of Glasgow in October 1791, and at five years of the first session, before he was thirteen years of age, carried off the Muirhead prize in the Humanity class. He was distinguished as a diligent and careful student, and gained several other prizes in his university course. He was at first inclined to adopt the medical profession, but finally decided in favour of the Christian ministry. With this view he attended from 1795 till 1800 the divinity hall of the Secession Church, then conducted at Selkirk by the Rev. George Lawson. Mr. Wardlaw decided to join the Scottish Independent denomination, which was then being organised by Messrs. Haldane, Aikman, and Ewing, and from the first he took a respectable, and very soon a leading position among the ministers of that body. A building having been erected by a number of his friends in Glasgow, with the view of obtaining him as their minister, a church was formed, and Mr. Wardlaw commenced his services on February 6, 1803. This position he maintained with much credit to himself and usefulness to the Independent body and to the dissenting community at large, till his death, a period of more than fifty years. On August 23rd 1803, he married his cousin, Miss Jane Smith, daughter of the Rev. Mr. Smith, of Dumfermline, by whom he had a family of eleven children. In 1811 Mr. Wardlaw was elected Professor of Systematic Theology in the Theological Academy of the Independent body, which was then established in Glasgow. In 1818 he received the diploma of D.D. from Yale College, Connecticut, and in December of that year, his congregation removed to a large and handsome chapel in West George-street, the erection of which had been rendered necessary by the increasing attendance on his ministry. In 1843 Dr. Wardlaw's health being somewhat impaired, the Rev. S. T. Porter was chosen as co-pastor, a connection which existed for about two years, when differences arose in consequence of charges made or supported by Mr. Porter against Dr. Wardlaw, the result of which was, the separation of Mr. Porter and a portion of the members from West George-street church, and the formation of a new church under Mr. Porter's pastoral charge. In this case, the deacons and the great body of the congregation adhered to Dr. Wardlaw, and a crowded meeting was held in the City Hall to express sympathy for him, and to present to him a piece of plate as a testimonial. In February 1853, the completion of the fiftieth year of his ministry was celebrated by special services and a public meeting, in connection with which a large sum of money was collected, and expended in erecting 'The Wardlaw Jubilee School and Mission House' at Dovehill, a destitute part of the city. He died on December 17th 1853, within a few days of completing his seventy-fourth year.

Dr. Wardlaw took an active part in various public questions and engaged in several controversies, chiefly theological, which gave rise to some of his most elaborate publications. He was frequently invited to London to preach anniversary sermons, and speak at public meetings of the great religious societies. On several occasions he declined invitations to accept professorships at the Independent Theological Academies in England. In April 1833 he delivered in London eight lectures in defence of congregationalism, forming the first series of an annual course called 'The Congregational Lecture.' In April 1835, at the request of the Protestant Dissenting Deputies, he delivered eight lectures in Freemasons' Hall, London, in answer to the lectures on Church Establishments, which had been delivered in London the previous year by Dr. Chalmers. As a preacher Dr. Wardlaw was much esteemed by members of all denominations. His discourses, which were very carefully prepared, were generally written out, and read with a clear and silvery voice, and a calm but impressive elocution. The following list contains the titles of his principal productions. Many single sermons, including several funeral discourses for distinguished ministers, and other friends, were likewise published by him. In 1805 he edited a Hymn Book for the Congregationalists in Scotland, containing several hymns of his own composition. In 1807 he published 'Three Lectures on Romans IV., 9-25,' on the question of infant baptism; in 1810, 'Essay on Mr. Joseph Lancaster's proposed improvements in Education;' in 1814, in one volume 8vo, 'Discourses on the Socinian Controversy,' in answer to Mr. Yates, the Unitarian minister in Glasgow; in 1816, in 8vo, 'Unitarianism incapable of Vindication,' in reply to Mr. Yates's 'Vindication of Unitarianism;' in 1817, 'Essay on Benevolent Associations for the Poor;' in 1821, in 2 vols. 8vo, 'Expository Lectures on the Book of Ecclesiastes;' in 1825, 'A Dissertation on the Scriptural Authority, Nature, and Uses of Christian Baptism;' 'The Divine Dissuasive to the Young against the Enticements of Sinners;' 'Man Responsible for his Belief,' in answer to Lord Brougham's inaugural discourse; in 1829, 'Introductory Essay to Doddridge's Practical Discourses on Regeneration;' a volume of Sermons; in 1830, 'Two Essays: I. On the Assurance of Faith; II. On the Extent of the Atonement and Universal Pardon;' in 1832, 'Discourses on the Sabbath;' 'Civil Establishments of Christianity tried by the Word of God;' in 1833, 'Christian Ethics, or Moral Philosophy on the Principles of Divine Revelation;' in 1835, 'Two Lectures on the Voluntary Church Question;' in 1836, 'Friendly Letters to the Society of Friends;' in 1839, 'National Church Establishments considered,' being the lectures delivered in London in reply to Dr. Chalmers; 'Sketch of the Life and Character of the Rev. Dr. McAll of Manchester,' prefixed to Dr. McAll's Sermons, edited by Dr. Wardlaw; in 1841, 'Letters to the Rev. Hugh M'Neile, M.A., on some portions of his Lectures on the Church of England;' in 1842, 'Lectures on Female Prostitution;' in 1845, 'Memoir of the Rev. John Reid,' Missionary at Bellary in the East Indies, and Dr. Wardlaw's son-in-law; 'The Life of Joseph and the Last Days of Jacob: a book for Youth and for Age;' 'Strictures on Dr. Halley's Congregational Lecture on the Sacraments,' in reference to Infant Baptism, &c.; in 1848, 'Congregational Independency, in contradistinction to Episcopacy and Presbyterianism, the Church Polity of the New Testament;' in 1852 (his last work), a 'Treatise on Miracles.' Dr. Wardlaw was likewise a contributor to various religious periodicals. Of Dr. Wardlaw's sons, one is a missionary in India, another a merchant in Glasgow.

(W. L. Alexander, D.D., *Memoirs of the Life and Writings of Ralph Wardlaw, D.D.*)

WARE, SIR JAMES, an Irish antiquary. His father, Sir James Ware, a native of Yorkshire, went to Ireland in the time of Elizabeth as secretary to Sir William Fitz-William, lord deputy in 1588, was subsequently appointed auditor-general for the kingdom, and purchased considerable property in and near Dublin. James, his eldest son, was born in Dublin on the 26th of November 1594, and at the fourth year he was entered at Trinity College, Dublin, and prosecuted his studies there for six years. Immediately after leaving college he married Mary, daughter of John Newman, Esq., of Dublin. By the advice of Usher he devoted himself to the study of Irish antiquities. During a residence of some years in England (1626-29), he contracted an intimacy with Selden and Sir Robert Cotton, by whose assistance he considerably increased his collection of manuscripts.

On his return to Ireland in 1629, he was knighted by the lords justices; and in 1632, his father dying suddenly, he succeeded both to his estate and the office of auditor-general. He applied himself assiduously to public business; obtained, in 1633, the confidence of Lord Wentworth (afterwards Earl of Strafford), and was by his advice created a member of the Irish Privy-Council. In 1639 Sir James Ware was elected a member of the Irish House of Commons. When the rebellion broke out in 1641, he assisted the government not only by his personal services, but also by becoming surety for sums of money advanced to it. His character for superiority to the partisan prejudices either of the Popish or Protestant party, occasioned his being sent, in December 1644, to inform the king, then at Oxford, of the real state of affairs in Ireland. He employed his leisure hours at Oxford in the prosecution of his antiquarian researches, and had the honorary degree of Doctor of Laws conferred upon him by the University.

The vessel in which Sir James Ware returned to Ireland was taken by one of the Parliament's ships. He underwent an imprisonment of ten months in the Tower of London, and was released by an exchange of prisoners. In 1647 he was one of the hostages for the performance of the treaty by which the Earl of Ormond surrendered Dublin to the Parliament. He was deprived of his office of auditor-general, but allowed to reside in Ireland, till Michael Jones, governor of Dublin, taking umbrage at him, ordered him to transport himself beyond seas

Digitized by Google

into any country he pleased except England. He made choice of France, where he landed early in 1649, and continued to reside till 1651, when he obtained a licence from the parliament to visit London on business. He resided two years in the vicinity of the metropolis. At the close of that period he was allowed to visit his estates in Ireland. He continued to lead a strictly private life till the Restoration, when he was reinstated in his office of auditor-general.

In 1661 the university of Dublin elected Sir James Ware one of its representatives. He was offered the title of baronet or viscount, but declined both. The Marquis of Ormond created him first commissioner of excise. He died in Dublin, on the 1st of December 1666. He left two sons and two daughters, the only survivors of ten children.

Sir James Ware's more important works are:—1, 'De Præsulibus Hiberniæ Commentarius,' fol., Dublin, 1665. He has incorporated into this work two of his Latin treatises; the one containing the lives of the Archbishops of Cashel and Tuam, published originally in 1626; the other the lives of the bishops of Dublin, published in 1628. 2, 'De Hibernia et Antiquitatibus ejus Disquisitiones,' London, 1654-58. Into this work is incorporated his history of the Cistercian monasteries of Ireland, published in 1656 at London, 'Opuscula Sancto Patricio adscripta;' and in 1664, at Dublin, two letters ascribed to the venerable Bede and the 'Lives of the Abbots of Wiremouth and Jarrow.' A translation of Sir James Ware's works into English was published in 1705, by his second surviving son Robert; a more complete edition, with additions, in 1739-46, by Walter Harris, who married a granddaughter of Sir James.

WARGENTIN, PETER WILLIAM, a distinguished Swedish astronomer, was born at Stockholm, September 22, 1717. When he was only twelve years of age there occurred a total eclipse of the moon, and the observance of this phenomenon is said to have inspired him with a taste for astronomical pursuits. He was intimately connected with Klingenstierna and Celsius, by whom he was recommended to study the motions of Jupiter's satellites; and in 1741, on taking his degree of Master in Arts, he maintained a thesis on the subject of those motions. Wargentin spent, in fact, the greater part of his life in efforts to correct the theory of the satellites; and, confining himself almost wholly to this branch of the science, the improvements which he made in it obtained for him the reputation of being one of the first astronomers of his age.

On the death of Celsius, in 1744, he was chosen corresponding member of the Academy of Paris, and five years afterwards he succeeded Elvius as perpetual secretary of the Academy of Stockholm. In 1759 he was made a knight of the Polar Star, and in 1764 he was elected a fellow of the Royal Society of London. He was also a member of the academies of St. Petersburg, Göttingen, Copenhagen, Drontheim, &c., and his communications to these societies are very numerous. When he was a candidate for the professorship at Upsal, he delivered a discourse on the progress of astronomy since the commencement of the century; and in the 'Memoirs of the Academy of Stockholm' there are several papers by him on the population of Sweden. He also wrote dissertations on the transits of Venus which took place in 1761 and 1769.

In order to determine the parallax of the moon, Wargentin made, at Stockholm, observations on that luminary simultaneously with the corresponding observations which were made by La Caille at the Cape of Good Hope, conformably to an agreement between the two astronomers previously to the voyage of the latter to the southern hemisphere; and from the observations so made the value of the parallax was correctly ascertained.

Wargentin married in 1753, and became the father of six children, three of whom survived him. He died December 13, 1783, leaving the reputation of having been a man of amiable manners and disinterested character. His devotion to science prevented him from paying due attention to his private affairs, and it is said that, near the close of his life, he was in part indebted to his friends for the means of being extricated from some embarrassments into which he had fallen. The Academy aided him from its funds, and struck a medal with an inscription denoting its sense of his merit. It also procured for his family a pension from the government.

An interval of time, in which the inequalities of the two first satellites of Jupiter are compensated, had been noticed in 1728, by Dr. Bradley, who however made no practical use of the period; and Wargentin, apparently without any knowledge of Bradley's discovery, both found the values of the inequalities and the time of the compensation. Wargentin also rectified the equation of Bradley respecting the aberration of light, and that which depends on the excentricity of Jupiter's orbit. His first tables of the movements of the satellites were published in the 'Acta Societatis Regiæ Upsaliensis, ad an. 1741;' and an improved edition was published by La Lande, in 1759, at the end of Halley's tables for the planets and comets. Pound's tables of the first satellite, though they generally gave the time of an immersion or emersion within a minute of the truth, were sometimes erroneous to the amount of five or six minutes; but those of Wargentin always agreed with the observations within one minute, and thus they became of great importance by affording the means of determining the longitudes of stations.

It is to be remarked that these tables were formed without any aid from physical astronomy. Wargentin determined the motions of the satellites from a combination of all the observations of their eclipses which he could procure, and during the whole course of his life he laboured to correct the errors which he discovered. He sent new tables of the third satellite to Dr. Maskelyne, who published them in the 'Nautical Almanac' for 1771; and the Almanac for 1779 contains an improved edition of the tables of the second satellite.

WARHAM, WILLIAM, an eminent English prelate, was born at Okeley in Hampshire, in the latter part of the 15th century, and after receiving his school education at Winchester, was admitted a fellow of New College, Oxford, in 1475. Here he remained, having in due time taken his degree of LL.D., till 1488, when he is understood to have been collated to some living in the church. Soon after however he is found to be practising as an advocate in the Court of Arches, and to be holding the office of Principal or Moderator of the Civil Law School in the parish of St. Edward, Oxford. His first public employment, as far as is known, was the mission upon which he was sent, along with Sir Edward Poynings, by Henry VII., in 1493, to Philip, duke of Burgundy, to persuade him to exercise his influence to put an end to the support and encouragement given to Perkin Warbeck by Margaret, duchess-dowager of Burgundy. Bacon, who, in his 'History of King Henry VII.,' gives a speech addressed by him upon the occasion to the archduke, calls him Sir William Warham, Doctor of the Canon Law. Although his endeavours in this affair were attended with little or no success, he continued to be in the good opinion of Henry, who esteemed men of ability and knew how to distinguish them; and he was made master of the rolls this same year, keeper of the great seal in 1502, and lord chancellor on the 1st of January 1503. In 1503 he was also made bishop of London; and in 1504 he attained the summit of his promotion by being raised to the archbishopric of Canterbury.

Warham opposed the marriage of Catherine, the widow of Prince Arthur, with his brother Henry, both when it was first proposed in the lifetime of Henry VII., and after the accession of that monarch to the throne in the beginning of the next reign. This brought him into collision with Fox, bishop of Winchester, whose rivalry and hostility were after wards inherited by his protégé the famous Wolsey. The latter, now became the chief favourite of Henry VIII., was substituted for Warham as lord chancellor in 1516. Both before and after this, there were contests as to jurisdiction between the archbishop and the cardinal; but Warham lived to see the fall of Wolsey, and even upon that event, in 1529, to have the great seal again offered to him, although his advanced years induced him to decline it. In his latter years he grew upon himself some discredit by his connection with the affair of the Maid of Kent, to whose impostures, either from credulity or party spirit, he showed some inclination to listen. He died at St. Stephen's, near Canterbury, 23rd of August 1532, leaving the primacy open to the new faith and new politics of Cranmer.

Warham was a great friend and patron of Erasmus, who dedicated to him his edition of St. Jerome, and in his letters speaks in the highest terms both of the learning and abilities and of the virtues of the archbishop.

WARING, EDWARD, the son of a wealthy farmer who resided near Shrewsbury, was born in 1736. Having shown at an early age a decided taste for geometry and algebra, he was sent, in 1753, to Magdalen College, Cambridge, where he made great progress in mathematical and physical studies. He attained the rank of senior wrangler, took the degree of Bachelor in Arts, in 1757. Three years afterwards the Lucasian professorship of mathematics being vacant by the death of Mr. Colson, Waring became a candidate for, and succeeded in obtaining, that honourable post: he was opposed by Mr. Maseres, afterwards Baron Maseres; and having, in order that he might prove himself to be qualified, published a portion of a mathematical work which he had commenced, a war of pamphlets on the subject of the work was, before the election, carried on between the two rival candidates and their friends. Waring not having taken the degree which was required by the statutes, a licence from the crown was obtained for the purpose of enabling him to hold the appointment.

In 1763, being then Master in Arts, Mr. Waring was elected a Fellow of the Royal Society; and in several of the volumes of the 'Philosophical Transactions' there are papers by him on subjects connected with the theory of equations, centripetal forces, &c. In the volume for 1779 is one on the method which he proposed for the general resolution of equations. This consists in assuming for the root of an equation the sum of a series of radical terms, the exponent of each being the reciprocal of the highest power of the unknown quantity, and the number of terms in the series being less by one than that exponent; on substituting that sum in the equation, and eliminating the radicals, the resulting equation, being compared with that which is given, will afford the means of obtaining

Digitized by Google

one of the values of the unknown quantity. It is observed however that the process may sometimes lead to an equation of a higher degree than that which it is proposed to resolve.

He also studied medicine, and in 1767 he took the degree of M.D.; but he has written nothing concerning the science, and it does not appear that he had much practice. His life was spent chiefly at the university, where he constantly performed the duties of his professorship; and he died August 15, 1798.

Dr. Waring was considered the most learned analyst of his age, and he is said to have been a men of simple manners, as well as of inflexible integrity; but so diffident of his powers of conversation, as to be greatly embarrassed when in the company of strangers. His mathematical works are very defective in method, and abound with typographical errors. Independently of his papers above-mentioned in, he published at Cambridge the following treatises:—1, 'Miscellanea Analytica de Æquationibus Algebraicis et Curverum proprietatibus,' 4to, 1762; 2, 'Meditationes Algebraicæ,' 4to, 1770; 3, 'Proprietates Algebraicum Curvarum,' 4to, 1772; and 4, 'Meditationes Analyticæ,' 4to, 1776. The third in the above enumeration is the most esteemed of all his works, and it contains a description of certain properties, at that time new, of algebraic curves, with the rectifications, radii of curvature, &c., of the lines: it treats also of the figures produced by the revolutions of the curves about given lines or axes, and contains investigations relating to the greatest and least values of lines drawn within and about them. Dr. Waring also published a tract on morals and metaphysics; and a pamphlet on probabilities, on the values of lives on survivorship, &c.

WARNEFORD, THE REV. SAMUEL WILSON, was the son of the Rev. Francis Warneford, vicar of St. Martin's, York, of an old and wealthy North Wiltshire family, and he was born at Sevenhampton, near Highworth, in Wiltshire, in 1758. At the usual age he was sent to University College, Oxford; ill health prevented his attaining any academical honours, but he graduated M.A. 1786, and B.C.L. in 1790. In 1796 he married a daughter of Loveden Loveden, Esq., with whom he acquired a considerable fortune; but a few years left him a widower without issue. In 1809 he was pre-nted by his college to the rectory of Lydyard Millicent, Wilts, valued at 500*l.* per annum; in 1810 he was presented to the rectory of Bourton-on-the Hill, in Gloucestershire, valued at 700*l.* per annum; and in the same year took the degree of D.C.L. He lived at Bourton very plainly and economically, and from an early period exerted a great part of his property to the promoting of large establishments beneficial to the public, for which purpose he carefully abstained from the common practice of bestowing trifling eleemosynary alms, refusing, it is said, assistance even to the poorer members of his own family. But these were no ostentatious in his princely gifts; many of them were anonymous. He founded schools and almshouses in his own parish. He was a contributor to schools, colleges, and hospitals throughout the kingdom. On the Clergy Orphan School, at various times, he bestowed 13,900*l.*; he contributed large sums for church purposes, particularly in his own country of Gloucester, and in Nova Scotia. He founded an hospital at Leamington which bears his name; and one for lunatics on Headington Hill, near Oxford. To King's College in London he presented anonymously several donations of 500*l.* each; but to Queen's College, Birmingham, a total amount of 5000*l.* His contributions was upwards of 25,000*l.* This institution was commenced by Mr. Sands Cox as a school of medicine, and Dr. Warneford liberally afforded pecuniary assistance, thereby enabling him to expand the school into a college, which was ultimately patronised by royalty. When it was found desirable to add other departments of education, Dr. Warneford was again the chief contributor; and desirous that religious instruction should be afforded, he founded the college chapel, and furnished the means for ensuring permanent religious teaching. In 1844, in recognition of his wide-spread beneficence, the bishop of Gloucester conferred on him an honorary canonry in Gloucester Cathedral; and in 1849 a statue of him was erected in the Warneford Lunatic Asylum at Oxford, the expense being defrayed by public subscription. He died at Bourton on January 11, 1855, enjoying good health till within a few days of his death. He bequeathed 20,000*l.* to the Christian Knowledge Society, and 2000*l.* to the Society for the Propagation of the Gospel, in addition to previous gifts.

WARNER, FERDINANDO, LL.D., a voluminous compiler and theological and miscellaneous writer of the last century, is said to have been born, where is not known, in 1703, and to have studied at Jesus College, Cambridge, but the latter fact is doubtful. Having taken holy orders, he became vicar of Ronde in Wiltshire, in 1730, and rector of St. Michael Queenhithe, London, in 1746, to which last preferment was added the rectory of Barnes in Surrey, in 1758. He died of gout, October 3, 1768. His degree of LL.D. he is supposed to have obtained from some Scotch university.

Of Dr. Warner's various publications the following are the most important:—'A System of Divinity and Morality, compiled from the works of the most eminent divines of the Church of England,' 5 vols., 12mo, 1750, and second edition, 4 vols., 8vo, 1756; 'An Illustration of the Book of Common Prayer,' &c., folio, 1754; 'The Ecclesiastical History of the Eighteenth Century,' 2 vols., folio, 1756-7; 'Memoirs of the Life of Sir Thomas More,' 8vo, 1758; 'The History of Ireland,' vol. i., 4to, 1763; 'The History of the Rebellion and Civil War in Ireland,' 4to, 1767. He was also the author of the scheme for the Middlesex Clerical Widows' and Orphans' Fund, in relation to which he published one pamphlet in 1755, and another in 1765. He left a son, the Rev. John Warner, D.D., born in 1736, who was of Trinity College, Cambridge, and who, after having long preached at a chapel of his own in Long Acre, London, was presented to the united rectories of Hockliffe and Chalgrave in Bedfordshire, and subsequently to the rectory of Stourton in Wilts. He died in 1800. Dr. John Warner was an ardent republican, and expounded the principles of his political philosophy in a work which he called 'Metronarism,' which was his principal literary performance.

WARNER, RICHARD, was born in 1711, and was educated at Oxford. His residence was at Woodford-row, in Essex, and he is remembered as the author of the 'Plantæ Woodfordienses,' which was published in 1771. From early life he was much attached to the study of botany, and having a fortune at his command, he bestowed much pains in collecting and cultivating exotic plants; but he was also educated for his critical knowledge of Shakspere, and at one time contemplated publishing an edition of his works. He died on the 11th of April 1775. He possessed a valuable library, which he bequeathed to Wadham College, Oxford. He also left a stipend for the purpose of establishing a botanical lecture in the University of Oxford. He was a man of literary tastes and habits, and was rather a patron of those who cultivated botany than a great botanist himself. 'Additions to Warner's Plantæ Woodfordienses' were published by Mr. Forster in 1784. Miller dedicated a genus of plants to him under the name 'Warneria.' Warner also translated in conjunction with Colman and Thornton some of the comedies of Plautus. [Thornton, Bonnel.]

WARNER, WILLIAM, a native of Oxfordshire, is supposed to have been born about 1558. He was a student at Oxford, but left the university without a degree, and going to London, became an attorney in the Common Pleas. He died suddenly, March 9, 1609, and was buried in the parish church of Amwell. He was the author of 'Albion's England,' on historical poem, or rather a collection of ballads, in thirteen books, in the Alexandrine stanza. This work, in his own time, was exceedingly popular, and was frequently reprinted in the course of the thirty years after 1586, when it was first published. Some of his contemporaries compared, or even preferred him, to Spenser. The general simplicity of the feeling and language, and the frequent indelicacy of his stories, make him appear to us in the beautiful pastoral episode of 'Argentile and Curan,' which is given by Percy and Campbell, as well as in several other collections. The whole poem, reprinted, is in Chalmers' 'British Poets:' a distinction which it well deserved, although it was far from meriting the extravagant recommendations of elder times. Warner was also the author of 'Syrinx, a Seavenfold Historie,' a collection of prose stories, published in 1597; and he is supposed also by Warton and others to have been the writer of a translation of the 'Menæchmi' of Plautus, which first appeared in 1595, and was reprinted by Steevens in 1770. In his 'Six Old Plays, on which Shakspere founded.'

WARREN, THE RIGHT HONOURABLE SIR JOHN BORLASE, BART., G.C.B., was born in 1754, at the family seat of Stapleford, in Nottinghamshire. Young Warren, when at Winchester School, ran away, went to sea, and entered a king's ship, which his friends procured him an appointment as a midshipman on board the Alderney sloop, commanded by Captain O'Hara; and in this capacity he served for some time in the North Sea. Returning to England, he placed himself as a pupil with the Rev. Thomas Martyn, the well-known botanical professor, at Taplow near Cambridge; and was soon after admitted as a gentleman commoner of Emmanuel College in that university. He took his degree of M.A. in 1776. Before this, in 1774, he was returned to parliament for the borough of Marlow, and in 1775 was created a baronet. Soon after he returned to sea, and serving with Lord Howe in America, as a lieutenant on board the Nonsuch, was, in 1779, made master and commander of the Helena sloop of war, and in 1781 received his commission as post-captain. He was re-elected for Marlow in 1780; and after the peace of 1783 he married the youngest daughter of General Sir John Wentworth, K.B., by Lady Diana Wentworth, daughter of the Earl Delaware. On the breaking out of the war of 1793 he was appointed to the Flora frigate, and in this and other ships greatly distinguished himself as a vigilant and active commander. In 1794 he received the ribband of the Bath, as a testimony of his majesty's high opinion of his services. In the summer of 1795 he acted as commodore of the division of ships which effected the debarkation at Quiberon Bay, intended to assist the royalists of La Vendée; and although that expedition proved eventually a failure, Warren was admired on all hands to have well performed his part. In 1797 he removed into the Canada of 74 guns; and being soon after detached to the coast of Ireland, he had the good fortune to fall in with the French naval force intended for the invasion of that country, and to obtain over it a signal victory, capturing the whole squadron, consisting of a ship-of-the line and three frigates, on the 11th of October 1798. For this important service he received a vote of thanks from both houses of parliament, and on the next promotion he was made a rear-admiral of the blue. Meanwhile at the general election of 1793 he had been returned to the House of Commons as one of the members for the town of Nottingham; and he was re-elected for the same place

Digitized by Google

in 1802. After the peace of Amiens Sir J. B. Warren was made a privy-councillor, and sent out as ambassador extraordinary and minister plenipotentiary to St. Petersburg, where he conducted some important and delicate negociations with great ability. On the breaking out of the war with America in 1812, he commanded for a short time on that station; but this was his last service. He died at Greenwich, on the 27th of February 1822. Sir John Borlase Warren is understood to have been the author of 'A View of the Naval Force of Great Britain,' &c., published anonymously, in 8vo, in 1790.

WARREN, JOSEPH, was born at Roxbury, near Boston, Massachusetts, in 1740: he graduated at Harvard College in 1759; and after leaving college he studied medicine, and obtained, while yet young, an eminent position among the medical practitioners of Boston. From 1768 till the commencement of hostilities, he was a leading member of the secret committee, or caucus, which directed the movements of the citizens of Boston. He was engaged in the affair of Lexington; and when Hancock left Boston to take part in the Congress at Philadelphia, was chosen president of the provincial congress, and received the commission of major-general. Four days later the battle of Bunker's Hill was fought, and Warren, who had thrown himself into the lines to encourage the Provincials, was killed by a ball which struck his head at the moment of retreat, June 17, 1775. He fell in his thirty-fifth year. The moral and intellectual character of Warren stands high; he had displayed great ability as an agitator, but his premature death has left it uncertain whether he possessed in an equal degree the talents of the officer or statesman.

WARREN, SIR PETER, K.B., was born in Ireland in 1703, and was descended from a family long settled in that country. Having gone early to sea, he received his first command in 1727, and had distinguished himself in various parts of the world, both by his good conduct and his good fortune, when, in 1745, he was sent out with a small armament to surprise Louisbourg, the capital of Cape Breton. The town and the whole island surrendered on the 15th of June; and for this service Warren was immediately made a rear-admiral of the blue, and after his return home rear-admiral of the white. In the beginning of 1747 he was appointed second in command, under Anson, of a fleet sent out to intercept two French squadrons, the one bound for America, the other for the East Indies; when the former, whose object was the recovery of Louisbourg, was fallen in with, and effectually disabled. For his share in this affair Warren was rewarded with the Order of the Bath, and soon after made a vice-admiral of the white. The next year he was made vice-admiral of the red. Meanwhile, in the autumn of 1747, in the height of a popularity to which his private virtues contributed as well as his public services, he had been returned to Parliament for Westminster. A few years after, that is in 1752, the general estimation in which he was held brought him a more singular compliment:—the inhabitants of the Ward of Billingsgate, in the city of London, having lost their alderman, insisted, despite his earnest remonstrance, and a present of 2000*l.* upon electing Warren, who had recently been made free of the Goldsmiths' Company, to the vacant post; and eventually he was obliged to pay the fine of 500*l.* to avoid serving. Warren died, after a short illness, on the 29th of July 1752, while on a visit to his native country. He was buried in Westminster Abbey, where there is a monument to him by Roubiliac.

*WARREN, SAMUEL, was born in Denbighshire in 1807, the son of a Wesleyan minister, of the same name, who had some literary reputation. He at first studied medicine, but changing his purpose he entered himself as a student of the Inner Temple, and was called to the bar in 1837. Between 1830 and 1838 he contributed a series of tales to Blackwood's Magazine' under the title of 'Passages from the Diary of a late Physician,' which probably his early studies had given him some hints for. They were written with much power—occasionally with much exaggeration—and generally possessed the painful interest attending the development of crime or woe. They however attracted attention, were reprinted in a separate form, and have been republished since. To this succeeded 'Ten Thousand a Year,' also first commenced in Blackwood, in 1839, and then published as a separate work. It was a work of more ambitious aim than his previous sketches, and evinces considerable talent, but is greatly disfigured and the interest damaged by an obtrusive political one-sidedness running through it as a whole. A second novel, 'Now and Then,' has less of this fault, but is greatly inferior to its predecessor in general effect and power. On being called to the bar Mr. Warren soon distinguished himself as an able pleader, and he showed that in his literary labours he had not lost the love of his profession. In 1835 he had published a 'Popular and Practical Introduction to Law Studies,' a work of great value, which he subsequently rewrote and enlarged under the title of 'A Popular and Practical Introduction to Law Studies, and to every department of the Legal Profession, Civil, Criminal, and Ecclesiastical, with an Account of the State of the Law in Ireland and Scotland, and occasional Illustrations from American Law,' published in 1845. In 1837 he published 'Select Extracts from Blackstone's Commentaries, with a Glossary, Questions, and Notes,' and he afterwards published 'Blackstone's Commentaries abridged, with additions,' which attained a second edition in 1856. In 1840 he published a pamphlet on 'The Opium Question,' which ran through four editions within the year. In 1848 he published the 'Moral, Social, and Professional Duties of Attorneys and Solicitors.' In 1851 he was made a Queen's Counsel, and in the same year issued a pamphlet 'The Queen or the Pope, the Question considered in its political, legal, and religious aspects, in a letter to S. H. Walpole.' In 1852 he published 'A Manual of the Parliamentary Election Law of the United Kingdom of Great Britain and Ireland,' which was followed in 1853 by 'The Law and Practice of Election Committees, being the completion of a Manual of Parliamentary Election Law.' In 1854 he was elected recorder of Hull, in which capacity he has made some excellent charges to the Grand Juries, some of which have been published. In 1856 he was elected member of parliament for Midhurst, for which place he was again returned to the new parliament in 1857, but resigned his seat in February 1859, on being appointed by Lord Chelmsford a Master in Lunacy. In addition to the works above named he has written 'The Intellectual and Moral Improvement of the present Age,' of which a third edition was published in 1854; 'Labour, its Rights, Difficulties, Dignity, and Combinations,' 1856; he is also known to have been a frequent contributor to Blackwood's Magazine. In 1851, after the opening of the Great Industrial Exhibition, he published a work, we believe his only printed attempt at poetry, written in broken lines, unrhymed, called 'The Lily and the Bee.'

WARTON, JOSEPH, D.D., was the eldest son of the Rev. Thomas Warton, professor of poetry in the University of Oxford, and afterwards vicar of Basingstoke, Hampshire, and Cobham, Surrey; and of Elizabeth, daughter of the Rev. Joseph Richardson, rector of Dunsford, Surrey. He was born at Dunsford, in the house of his maternal grandfather, in 1722; was educated, till he reached his fourteenth year, principally at home by his father; was then admitted on the foundation of Winchester College, whence he went to Oriel College, Oxford, in 1740. Having taken his degree of B.A. in 1744, he was ordained to the curacy of his father's vicarage of Basingstoke; and here he officiated till he removed, in February 1746, on the death of his father, to Chelsea, where he was curate for about a year. After this he held for a few months the curacy of Chawton and Droxford in Hampshire, and then returned to Basingstoke. In 1748 he was presented by the Duke of Bolton to the rectory of Winslade, in the neighbourhood of Basingstoke; upon which, although the living was but a poor one, he immediately married Miss Damon, to whom he had been for some time attached.

One of Warton's schoolfellows at Winchester was Collins, afterwards the celebrated poet; and they two and another boy had in these early days been poetical contributors to the 'Gentleman's Magazine.' Warton's next printed composition appears to have been his ode entitled 'A Superstition,' which he sent from Chelsea to Dodsley's 'Museum,' in April 1746. The same year he published a volume of Odes and other poems, in the same month, it is said, in which his friend Collins printed his 'Odes, Descriptive, and Allegorical.' In this or the next year also, he joined his brother Thomas in publishing by subscription a volume of his father's poems. In 1749 appeared his 'Ode to Mr. West' (Gilbert West, the translator of Pindar.)

In 1751 Warton accepted the invitation of his patron the Duke of Bolton to accompany him on a tour to the south of France, with the understanding that he should be in readiness immediately on the death of the duchess, then in a confirmed dropsy, to marry his grace to his mistress, Miss Lavinia Fenton, the actress. This engagement appears to have been thoughtlessly made by Warton, who, after all, left the duke before the duchess died, when he, upon that event, solicited permission to return, learned to his mortification that the marriage had been performed by another clergyman. After his return to England, Warton published an edition of Virgil, accompanied with a new verse translation of the 'Eclogues' and 'Georgics' by himself, and one of the 'Æneid' by Christopher Pitt, and illustrated by numerous notes and dissertations. The translation was intended to be an improvement upon that of Dryden, but its greater correctness is obtained at a considerable sacrifice of ease and spirit. The work, which appeared in 1753, brought Warton great reputation at the time; and is stated to have been the ground upon which he was honoured by the University of Oxford with a diploma of M.A. in 1759.

Among the most popular of Warton's literary performances are some papers on critical subjects, which he contributed to Dr. Hawkesworth's periodical publication, the 'Adventurer,' in 1753. In 1754 he sent some of his early poetical productions to Dodsley's Collections, then in course of publication. That year he was instituted to the living of Tunworth, on the presentation of the Jervoise family; in 1755 he was elected second master of Winchester school; and in 1756 his friend Sir George Lyttelton, on being made a peer, nominated him one of his chaplains. He now published in 1756 the first volume, in 8vo, of the work by which he is principally known, his 'Essay on the Writings and Genius of Pope.' It appeared without his name, but his authorship of it seems to have been generally known from the first. This is the work in which the principles of what has been called the Warton school of poetical criticism will be found to be most systematically expounded; although the same mode of thinking is to be detected in all the critical writings of the two brothers. Although the author was far from disputing the great merit of Pope in his own walk of poetry, and only contended that his was not the

Digitized by Google

highest kind of poetry, the book gave great offence to the generality of Pope's admirers; and its reception on the whole does not appear to have been encouraging. Its conclusion, in a second volume, did not appear till 1782. It has however since made its way in public favour, and is now admitted, even by many who do not go all the length of the author's distinction between what he called the poetry of fancy and the poetry of reason, and of his exaltation of the former over the latter, to have at least called attention to some important views in regard to this matter which had been too much forgotten, and in that way to have had a decidedly favourable effect upon our poetical literature.

In 1766 Warton became head master of Winchester school, upon which occasion he visited Oxford, and took his degree of Bachelor and Doctor of Divinity. In 1777 he lost his wife; but in about a year married Miss Nicholas, daughter of Robert Nicholas, Esq. In 1782 his friend Dr. Lowth, then bishop of London, gave him a prebend of St. Paul's, and the living of Thorley, in Hertfordshire, which he afterwards exchanged for Wickham. In 1788, through Lord Shannon, he obtained a prebend in Winchester cathedral, and, through Lord Malmesbury, the rectory of Easton, which he was soon after permitted to exchange for Clapham. In 1793 he resigned the mastership of Winchester school. After this he undertook an edition of Pope's works with notes, which he completed in 9 volumes, 8vo, in 1797. It was followed by the commencement of a similar edition of Dryden, of which he lived only to publish two volumes. He died 23rd of February 1800, leaving a son and three daughters, the youngest by his second wife, who survived till 1806. A Biographical Memoir of Dr. Joseph Warton, with a selection from his poetry and literary correspondence, was published in 1806 by the Rev. John Wooll, master of the school of Midhurst in Sussex. The poetry of Joseph Warton has little merit beyond that of an agreeable vein of common-place fancy, and some elegance and tunefulness of expression.

WARTON, THOMAS, was the younger brother of Dr. Joseph Warton, and was born at Basingstoke, in 1728. Like his brother, he was mostly educated at home by his father, till he was admitted a commoner of Trinity College, Oxford, in March 1743. He was soon after elected a scholar, took his degree of B.A. in 1750, succeeded to a fellowship in 1751, and spent the rest of his life in his college, employing his time partly as a tutor, partly in literary occupations.

The first of his compositions that were printed were a song and a prize essay, which he communicated in 1745 to Dodsley's 'Museum.' Soon after he published by itself his poem entitled 'The Pleasures of Melancholy.' The first production however that brought him into much notice was his 'Triumph of Isis,' published in 1749, in reply to Mason's poem of 'Isis,' which was a satire upon the loyalty of Oxford. In 1748 he contributed a few pieces to 'The Student, or Oxford and Cambridge Miscellany,' amongst which was his 'Progress of Discontent,' one of the happiest of his humorous effusions. The next year he published his satire entitled 'Newmarket,' and some other pieces in verse. In 1753 he edited, without putting his name to it, a small volume, which appeared in Edinburgh, with the title of 'The Union, or select Scots and English Poems,' among which were several of his own, some previously published, some new. In 1754 he published, in an 8vo volume, his 'Observations on the Faerie Queene of Spenser,' a work which at once established the reputation both for extensive reading and for extensive and varied learning. It was extended to two volumes in a second edition, which appeared in 1762.

In 1757 Warton was elected professor of poetry; and in the course of the lectures which he delivered while he held that office he introduced his translations of Greek anthology, many of which are found among his collected poems, and also his Dissertation on the Bucolic Poetry of the Greeks, which he afterwards prefixed, in Latin, to his splendid edition of Theocritus, published, in 2 vols. 4to, in 1770. In 1758 he published, in 4to, a tract now become rare, entitled 'Inscriptionum Romanarum Metricarum Specimen,' a selection of Roman epigrams or inscriptions, with the addition of some modern ones, among which are a few of his own. In this and the following year also he contributed several papers to his friend Dr. Johnson's periodical publication, 'The Idler.' In 1760 he published anonymously, in 12mo, 'A Description of the City, College, and Cathedral of Winchester.' This was followed the same year by a piece of drollery, entitled 'A Companion to the Guide, and a Guide to the Companion, being a complete supplement to all the Accounts of Oxford hitherto published,' which presently went through three editions. Soon after this he wrote for the 'Biographia Britannica' the life of Sir Thomas Pope, which he republished by itself, in 8vo, in 1772, and again in 1780, with considerable alterations and additions. In 1761 he produced, in an 8vo volume, his 'Life and Complete Remains of [Richard] Bathurst' (celebrated for his Latin poetry). His next separate publication was the 'jeu d'esprit' entitled 'The Oxford Sausage, or Select Pieces written by the most celebrated Wits of the University of Oxford,' which came out anonymously in 1764. From this date he appears to have printed nothing till 1766, when he superintended an edition from the Clarendon press of the Greek Anthology of Constantinus Cephalas, to which he prefixed a learned preface.

He took his degree of B.D. in 1767, and in 1771 he was instituted to the small living of Kiddington in Oxfordshire, on the presentation of the Earl of Lichfield, then chancellor of the university. This, and the donative of Hill Farrance in Somersetshire, to which he was presented by his college in 1782, were Warton's only ecclesiastical preferments, although, as has been remarked, the number of persons of rank to whom he had been tutor (among them the son of Lord North) might have fairly led him to expect a much larger share of patronage. He would no doubt have obtained something more if he had cared very much about it; but, besides that his modest and unambitious nature kept him from asking, he had no taste either for theological studies or professional duties. It is related that in preaching he used to confine himself mostly to two sermons, one of which was an old one of his father's—the other a printed one, here and there curiously abridged with the pen.

In 1774 he published the first volume, in 4to, of his great work, 'The History of English Poetry.' A second volume appeared in 1778, and a third in 1781. Into this elaborate performance Warton poured the accumulated stores of a lifetime of reading and reflection; and the survey he has given us of his subject is accordingly both eminently comprehensive in its scope and rich and varied in its details. The work is indeed too discursive and too much encumbered by minute learning to have anything of the character of a classical composition; but it is a repository of information respecting our early national literature unapproached in extent and abundance by any other single work of the same kind in the language. Warton's just taste and true poetic feeling give at the same time a sunshine to his pages which raises the book far above a mere compilation. It remains however unfinished: of the fourth volume only about ten sheets were found to be printed at his death, bringing down the history very little beyond the commencement of the reign of Elizabeth. There have been two recent editions of it in 8vo, with the addition of much new matter in the form of annotation, but without any continuation of the narrative: one in 4 vols., by Mr. Richard Price, London, 1824; the other in 3 vols., forming a reprint of Mr. Price's edition, with additional notes, which was brought out under the care of Mr. Richard Taylor in 1840.

Warton made a collection of those of his poems which he thought worthy of preservation, and published it in 1777; and other editions followed in 1778, 1779, and 1789. He was made poet-laureate on the death of William Whitehead; and the same year he was elected Camden Professor of History at Oxford, on the resignation of Dr. William Scott (the late Lord Stowell). In 1785 also he published an edition of Milton's Juvenile or Minor Poems, copiously illustrated with learned and curious notes, which also re-impressed, as before, before his death, appeared in 1791. He died suddenly, on the 21st of May 1790. A Life of Warton was prefixed to a new edition of his Poems, by Mr. Mant, in 1802.

Thomas Warton, having produced no poetical performance of any considerable length, can only be reckoned as one of our minor poets; but among these he occupies a high place—not in the first rank, with Collins and Gray, but perhaps in that next to them. His poetry, without including his Pindaric odes (which, although they are also superior to many, may be disputed with in the estimate of his claims), embraces three very distinct departments—the descriptive, the romantic, and the humorous; and in each of these kinds of writing he has shown much more than mere taste and imitative power. He had at least both the ear and eye, if not the mould of the "fine frenzy" of a poet, and wrote always from genuine although not perhaps the most passionate impulses. There are not many things of the kind in the language, except in Prior and Swift, better than his 'Progress of Discontent,' his lines 'To the First of April,' without the same richness of glow, but more much of the picturesque, as well as true national feeling, of Milton's 'L'Allegro' and 'Il Penseroso;' and his tale, or ode, as he calls it, entitled 'The Crusade,' is perhaps superior to any preceding attempt to re-awaken the echoes of our ancient romantic minstrelsy.

WARWICK, GUY, EARL OF. Several of our mediæval chroniclers speak of this famous personage as having without doubt actually existed: Henry Knighton, for instance, who wrote about the end of the 14th century, gives a full abstract of his story in his 'Chronica de Eventibus Angliæ' (printed in Twysden's 'Scriptores,' col. pp. 2311-2743); and even in modern times several writers have been inclined to hold that his exploits had probably a basis of reality. Dugdale does not admit him into his Baronage; but in his 'Warwickshire,' although he acknowledges that the monks have sounded out his praises too hyperbolically, he considers his story to be not wholly legendary or spocryphal, and even takes pains to fix the date of one of his achievements—his combat with the Danish champion, "Colbrand, the giant, that same mighty man," as he is called in 'King John,' by Shakspere, who has also another allusion to the same matter in his 'Henry VIII.' (act. v, sc. 3), to the year 926, when Guy, as he conceives, was in the sixty-seventh year of his age. Much more recently, Mr. George Ellis (in his 'Specimens of Early English Metrical Romances') has suggested that possibly Egil, an Icelandic warrior, who contributed very materially to the important victory gained by the Saxon king Athelstan over the Danes and their allies at Brunanburgh, "becoming the hero of one of the many odes composed on the occasion of that much celebrated battle, may have been transformed by some Norman monk into the pious and amorous Guy of Warwick." "This," observes Mr. Price, the late editor of Warton's 'History of

Digitized by Google

English Poetry' (ii. 2), "at best is but conjecture, nor can it be considered a very happy one. . . . . The initial letters in Guy, Guyon, and Guido are the representatives of the Teutonic W, and clearly point to some cognomen beginning with the Saxon *Wig* (bellum)."

Guy in fact must be considered as a personage belonging not to history, but to fable and romance. Camden was perhaps one of the first inquirers among us if not the very first, who ventured to intimate so much, when in giving an account of the earls of Warwick in his 'Britannia' (Warwickshire) he wrote (as Bishop Gibson has translated the passage), "To pass by Guar, and Morindus, and Guy, the echo of England (the Leodin is, Anglus tympanum, meaning rather the drum of England, that is, the most resounding of English names), with many more of that stamp, which the fruitful wits of those times brought forth at one birth." Even as a hero of romance, Guy, though evidently referrable to an early Anglo-Norman origin, can scarcely be traced with certainty to a more remote date than the earlier part of the 14th century. "Guy of Warwick," Ritson observes, "is mentioned by no English historian before Robert of Brunne, or Peter de Langetoft, about 1340." Among the "romances of price" enumerated by Chaucer in his 'Rime of Sir Thopas,' in the 'Canterbury Tales,' are mentioned those of "Bevis and Sir Guy" (line 13,827). Bishop Percy, in his 'Essay on the Ancient Metrical Romances,' in the third volume of his 'Reliques of Ancient English Poetry,' remarks (p. 33) that "the Romance of Sir Guy was written before that of Bevis, being quoted in it." In this place Percy gives an account of various manuscripts of the romance of Sir Guy, and also of some other old romances connected with the same story. See also the fourth appendix to Sir Walter Scott's edition of 'Sir Tristrem.' Percy (vol. iii., pp. 106-117) has published two old English poems, 'The Legend of Sir Guy,' and 'Guy and Amarant.' Some extracts from the romance of Sir Guy are given by Warton, 'Hist. of Eng. Poet.,' ii. 1-7 (edit. of 1824). See also vol. i., pp. xxxix., cxxiv., 91-93, 146, 147, 149; ii. 44; iii. 2, 425. An account of the romance of Guy of Warwick, with copious extracts, is given in Ellis's 'Metrical Romances,' vol. ii., pp. 3-94 (the ed. in Bohn's 'Antiquarian Library,' pp. 188-238). For a compendious summary of the hero's exploits, the reader may turn to the 'Legend' printed by Percy, or to the 12th and 13th songs of Drayton's 'Polyolbion.' The modernised prose abridgment of the story of Sir Guy used to be a common stall pamphlet. There is also a metrical work, under the title of 'The Book of the most victorious Prince, Guy, Earl of Warwick,' was, according to Ritson, printed in 4to by William Copland before 1567, and again by John Cawood before 1571: of the earlier impression there is an imperfect copy in Garrick's collection at the British Museum, and there was a perfect one in the Roxburgh Library, which was purchased by Mr. Heber for 43*l.*, and at the dispersion of his library sold for 25*l.* There is also a French romance of Sir Guy, which was printed in 1525; but whether earlier or later than the English story perhaps be doubted, although Mr. Ellis has said that the work which he has abridged "was written, in French at least, as early as the 13th century, and translated in the beginning of the 14th; so that Mr. Warton is evidently mistaken in supposing that it was partly copied from the 'Gesta Romanorum' (cap. 172), which, by his own admission, was composed at a much later date."

WARWICK, EARLS OF. The first historical earl of Warwick was Henry de Newburgh, a younger son of Roger de Bellomont, Earl of Melient in Normandy (who was created by the Conqueror Earl of Warwick in 1123. In this family the honour remained till Thomas de Newburgh, dying in 1242, without issue, left Margery, his half-sister, his heir; and she marrying first John Mareschall, of the family of the Earls of Pembroke, and, after his death, John de Plessets, each of these her husbands took successively the title of Earl of Warwick. She had however no issue by either; and her second husband having died in 1263, and she herself soon afterwards, the earldom was inherited by William Mauduit, or Malduit (in Latin, Male-doctus), who was her first cousin, being son of her aunt Alice (half-sister of her father) and of William Mauduit, baron of Hanslap. On his death, without issue, in 1267, he was succeeded in the earldom by William de Beauchamp, baron of Elmley, who was his nephew, being the son of his sister Isabel de Mauduit and her husband William de Beauchamp. The Beauchamps continued earls of Warwick till the death, without issue, of Anne, countess of Warwick, in 1449, upon which Richard Nevil, eldest son of Richard, earl of Salisbury, having married Anne de Beauchamp, aunt of the late countess, was created Earl of Warwick the same year: he was succeeded by the earldom by Edward, in 1469, and was killed at the battle of Parnet in 1471, when, an act of attainder having taken place, his honours were forfeited, and George Plantagenet, duke of Clarence, brother of King Edward IV., having married Isobel Nevil, his eldest daughter, was created Earl of Warwick and Salisbury in 1472. Clarence was put to death and attainted in 1478; but his son Edward Plantagenet bore the title of Earl of Warwick till he also met with a similar fate in 1499. From this time there was no earl of Warwick till the honour was conferred by Edward VI., in 1547, upon John Dudley, Viscount Lisle, who was maternally descended from Margaret Beauchamp, daughter of Richard de Beauchamp, twelfth earl. Dudley (afterwards created Duke of Northumberland) was attainted and beheaded in 1553; but his second son, Ambrose Dudley, after being restored in blood, was created Earl of Warwick by Queen Elizabeth in 1562, and retained the title till his death, without issue, in 1589. After this the earldom remained extinct till 1618, when it was revived and conferred by James I. upon Robert Rich, third Baron Rich of Leeze: and it was retained (from 1673 in conjunction with the earldom of Holland) by this family till the death of Edward Rich, earl of Warwick and Holland, without male issue, in 1759. Upon this event the earldom of Warwick was conferred upon Francis Greville, first Earl Brooke, whose ancestor, Sir Fulke Greville, early in the 16th century, married Elizabeth Willoughby, granddaughter and heiress of Lord Willoughby de Broke and his wife Elizabeth Beauchamp, who was descended from Walter de Beauchamp, baron of Alcester and Towyck, third son of Isabel de Mauduit and William de Beauchamp, and brother of William de Beauchamp, who became Earl of Warwick in 1267. In this family the titles of Earl Brooke and Earl of Warwick still remain, the latter, contrary to what is usual, being the one commonly used, although the former, conferred in 1746, is by a few years of earlier date.

WARWICK, RICHARD DE BEAUCHAMP, EARL OF, K.G., was the son of Thomas, eleventh earl, and of Margaret, daughter of William, Lord Ferrers of Groby, and was the first of his family who greatly distinguished himself in the service of the state. He succeeded to the title upon the death of his father in 1401. In 1417 he was created Earl of Aumerle for life. In 1425, having been sent over to France with a reinforcement of 6000 men, he was left by the Duke of Bedford to act as regent of that kingdom during his own absence in England. While holding this post he carried on the war with great success, making himself master in the course of the next two years of some of the strongest places in the province of Maine. On the return of the Duke of Bedford to France, in February 1428, Warwick was called home by the English council and appointed governor to the king, Henry VI., now in his seventh year, and hitherto brought up under the care of Dame Alice Botiller. He continued to perform the duties of this honourable office, which seems to have been no sinecure, till 1437, when, on the recall of the Duke of York from the regency of France, Warwick was sent over as his successor; but this his second administration of the affairs of that kingdom was not distinguished by any remarkable event, or by any at least in which he was personally engaged. He fell sick before he had held his appointment quite two years, and died at the castle of Rouen on the 30th of April 1439. In October following his body was brought over to England, and interred at Warwick. This Earl of Warwick, who was styled the Good, left by his second wife, Isabel, daughter of Thomas Despenser, earl of Gloucester, a son, Henry, and a daughter, Anne, who married Richard, eldest son of Richard Nevil, earl of Salisbury, created earl of Warwick in 1449.

WARWICK, HENRY DE BEAUCHAMP, EARL AND DUKE OF, K.G., was the son of Richard, twelfth earl, whom he succeeded in the title in 1439. It is said that his estate was kept out of possession by the king, Henry VI., for two years after his father's death; but Henry afterwards, by way of making up for this injustice, on the 2nd of April 1444, nominated him premier earl of England, with the privilege of wearing a gold coronet on his head on the same month raised him to the dignity of Duke of Warwick. The next year he made him King of the Islands of Wight, Jersey, and Guernsey, crowning him with his own hand. Beauchamp however did not live long to enjoy these extraordinary honours; he died on the 11th of May, 1446, the same year, when his dukedom became extinct, and the earldom of Warwick fell to his daughter Anne de Beauchamp, his only child by his wife Cicely, daughter of Richard Nevil, earl of Salisbury, the sister of his sister's husband. Anne, countess of Warwick, died at six years of age, in 1449.

WARWICK, RICHARD NEVIL, EARL OF, K.G., was the eldest son of Richard Nevil, earl of Salisbury, and was probably born about the beginning of the reign of Henry VI., or soon after 1420. His mother was Alice, daughter and heiress of Thomas Montacute, earl of Salisbury; and it was in consequence of his marriage with this lady that Richard Nevil, himself a younger son of Ralph, earl of Westmorland, was created earl of Salisbury in 1422. His son, the subject of the present notice, in his father's lifetime married Anne, daughter of Richard de Beauchamp, earl of Warwick, who, upon the death of her niece Anne, infant daughter of Henry, duke of Warwick, in 1449 came into possession of the great estates of the Warwick family. Upon this, the Lord Richard Nevil, as he was then styled, was created Earl of Warwick, the dignity to descend to the heirs of his wife, "with all pre-eminences that any of their ancestors before the creation of Henry, duke of Warwick, used." His two uncles William and Edward Nevil, younger brothers of his father, were at the same time Barons Fauconberg and Abergavenny, having acquired these dignities by marriage; and another of his uncles, George Nevil, was Baron Latimer, an honour which had also come into the family by marriage a generation or two before. But the highest and most important of Nevil's alliances was that which connected him with Richard, duke of York, whose wife was Cecily, daughter of Warwick's grandfather, Ralph, earl of Westmorland, and who, as representative of Lionel, earl of Clarence, third son of Edward III., was the undoubted lineal heir to the throne, now occupied by the house of Lancaster, descended from King Edward's fourth son, John of Gaunt. In this way the Earl of Warwick and King Edward IV. (son of Richard, duke of York), were first cousins.

Digitized by Google

It is important to keep in view this strong natural or family position of the great Earl of Warwick as to a material extent accounting for the vast power which he came to exercise in the state. The Nevils were at this time perhaps the most extensively connected family that has ever existed among the nobility of England. Besides the Nevils of Raby, from whom the Earls of Westmorland were sprung, there were several other baronies held by other branches of the same stock, dating also from the first reigns after the Conquest. The Talbots, earls of Shrewsbury, were also descended from a Thomas Nevill, brother of Ralph, earl of Westmorland, and from him had inherited the barony of Furnival, which he had acquired by marriage, after the fashion of so many of his family.

His extended connections and immense possessions were joined in Warwick to the most distinguished personal qualities: intrepidity, decision, and all the military virtues, eloquence and general talent, an affability and frankness of bearing that captivated equally all classes, a boundless hospitality and magnificence that enthroned him in the universal heart of the commons. Wherever he dwelled, we are told, he kept open house. It is affirmed that the number of people daily fed at his various mansions, when he was at the height of his prosperity, was not less than thirty thousand. "When he came to London," says Stow, in his 'Chronicle,' "he had such an house that six oxen were eaten at a breakfast, and every tavern was full of his meat; for who that had any acquaintance in that house he should have had as much sodden and roast as he might carry upon a long dagger."

The history of this mighty peer is that of the whole of the contest between the two houses of York and Lancaster from the time he earned rising against Henry VI. to the final establishment of Edward IV. on the throne, by the overthrow of the Lancastrian forces in the fight of Barnet. Here we can only briefly note the more important events that marked his career.

He is first mentioned as accompanying his father, the Earl of Salisbury, upon a hostile incursion across the Scottish marches, which Salisbury conducted in 1448 in conjunction with the Earl of Northumberland. The Lord Richard Nevil, as he was then called, greatly distinguished himself by his bravery in this expedition. When the Duke of York took up arms in 1455, he was joined both by Warwick and Salisbury; and the battle of St. Albans, fought on the 22nd of May, was mainly won by the impetuous valour of Warwick. Immediately after this, while the office of chancellor was bestowed by the parliament upon Salisbury, Warwick was rewarded with the government of Calais, then and for a long time after the most important military charge in Christendom. To this was added two or three years subsequently by Henry, who perhaps wished to attach to himself so able and powerful a subject, the office of the sea, or command of the fleet, for five years. It was in virtue of the latter appointment that, on the 29th of May 1458, he set out from Calais with five large and seven small vessels, and attacking a fleet of twenty-eight sail belonging to the free town of Lübeck, captured six of them after a contest which lasted six hours. In the Yorkist manifesto issued to his attempt in the summer of 1459, Warwick came over from Calais with a large body of veterans, with which he joined his father at Ludlow, a day or two after Salisbury's victory over Lord Audley at Blore heath in Staffordshire, on the 23rd of September. On the dispersion of the Yorkists at Ludiford, a few weeks after, through the treachery of Sir Andrew Trollop, who deserted to the royal army, Warwick returned to Calais: he was superseded in that government by the Duke of Somerset, and in his command of the fleet by the Duke of Exeter; but when Somerset attempted to enter the harbour of Calais, he was fired upon from the batteries and compelled to retire. In the beginning of June following, Warwick again landed in Kent with a force of fifteen hundred men; before he reached London, according to some accounts, nearly forty thousand of his countrymen had flocked to his banner; the capital, from which King Henry had fled, received him with all welcome; the battle of Northampton followed, on the 10th of July, at which Henry fell into the hands of the Yorkists. The next remarkable events in this fluctuating struggle were the battle of Wakefield, in Yorkshire, fought on the 30th of December, where the Duke of York was defeated by Queen Margaret, and lost his life, and where the Earl of Salisbury was also taken, and beheaded next day at Pontefract; and the queen's second victory over the Yorkists, commanded in this instance by Warwick, at Bernard's Heath, near St. Albans, on the 17th of February 1461, which restored Henry to liberty. But the junction, immediately after this, of the forces of Warwick and the young Edward, earl of March, new Duke of York, compelled the royal army to retire to the north. Edward, accompanied by Warwick, entered London in triumph; on the 4th of March he was proclaimed king, by the title of Edward IV.; and on the 29th the defeat of the Lancastrian army at Towton in Yorkshire secured the throne to King Edward. On this occasion the main body of the Yorkist army was commanded by the Earl of Warwick; who also, during the next two or three years, while the contest still lingered, performed various important military services to his new prince. In the winter of 1462-1463 he reduced the three strong fortresses of Bamborough, Alnwick, and Dunstanburgh; and it was to him also that the castle of Bamborough capitulated a second time, in May 1464, after it had been made over to the Lancastrians by the defection of the governor, Sir Ralph Grey. Finally, it was Warwick by whom the unfortunate Henry was conducted to the Tower, in June 1465, after his capture at Waddington Hall in Yorkshire, about fourteen months after the final defeat of the Lancastrians at Hexham by Warwick's brother, Lord Montague.

The Nevils were now in a manner the rulers of the king and kingdom. Warwick himself, besides his government of Calais, held the office of chamberlain and the wardenship of the West Marches; his next brother, Lord Montague, was warden of the East Marches, and had obtained the extensive estates of the Percies, with the title of Earl of Northumberland; his youngest brother, George, was lord high chancellor and Archbishop of York. But circumstances soon arose to alienate Edward from partisans to whom he was too deeply indebted for the two parties to continue friends in their relative positions. The king's marriage, which took place in 1464; the jealousy of the queen's relations, the Wydvilles; the marriage of the king's sister, the Princess Margaret, with the Duke of Burgundy, brought about in 1468, in opposition to the advice of Warwick; the seductions of the French king Louis XI.; the arts of Lancastrian emissaries; and, according to one account, an attempt made by Edward in the earl's own house, to violate the chastity of his niece or daughter—are supposed to have been the principal causes that contributed to sever the king from the Nevils; but the story is too complicated, and, in many parts, obscure, to admit of being detailed or investigated to any purpose, in so rapid a summary as this. We may merely remark that Dr. Lingard appears to have shown that the common account which makes Warwick to have been in France negociating on the part of the king a marriage with Bona of Savoy, sister to the French queen, at the time when Edward clandestinely married Elizabeth Wydville, cannot be true. (See his 'Hist. of Eng.,' v. 190, note, edition of 1837.) The first open intimation of the loss by the Nevils of the royal favour was given in June 1467, by the king commanding the Archbishop of York to deliver up the great seal. After some time was a formal reconciliation, and the next year, Warwick, who had retired, with a clouded countenance, to his castle of Middleham in Yorkshire, appeared again at court. But the hollow compact did not last long. In July 1468, Edward's next brother, George, duke of Clarence, gave mortal offence to his majesty by marrying Isabel, the eldest of the two daughters of the Earl of Warwick. Immediately after this there broke out in Yorkshire an insurrection of the peasantry, which, being joined by two near connections of Warwick's, the sons of the Lords Latimer and Fitzhugh, speedily assumed and converted into an avowed attempt to drive the Wydvilles from the management of affairs. The royalists were routed with great slaughter at Edgecote, on the 26th of July; and a few days after, Edward was taken prisoner by Warwick and Clarence at Olney. The king was detained in confinement at Middleham, under the care of the Archbishop of York, for two or three months, during which Warwick twice defeated bodies of the Lancastrians who had risen in the north, counting upon his support of the cause of King Henry. While Edward was in his hands, also, the earl obtained from him a grant of the office of justiciary of South Wales, and all of all the other dignities held by the late Earl of Pembroke, who had been beheaded after the battle of Edgecote. Coetradictory accounts are given of the manner in which the king recovered his liberty; but he was at large again before the end of the year, and apparently on terms of Warwick. A new rupture, followed by another seeming reconciliation, took place in February, 1470. But in all these movements both parties were probably only attempting to gain time and opportunity to destroy one another. In the beginning of March an insurrection broke out in Lincolnshire, which soon very clearly appeared to have been instigated by Warwick and Clarence; but before they could join the insurgents, who were headed by Sir Robert Wells, the son of Lord Wells, the latter were defeated by the king's troops, on the 12th of March, at Lovedale, in Rutlandshire. In this battle Warwick and Clarence fled first to the north; whence, pursued by the king, they returned to Exeter, and embarked for Calais; but here, to their astonishment, the guns of the batteries were turned upon them by the deputy, a Gascon named Vaudere, to whom Warwick had entrusted the keeping of the place. On this they made for Harfleur, and were there received with distinguished honours by the Admiral of France. Shortly after this, on the 15th of July, Warwick met Henry's queen, Margaret, at Amboise, and there the two solemnly agreed to forget the past, and to unite their interests and efforts for the future, sealing their compact by the marriage of Margaret's son, Prince Edward, to Warwick's second daughter, Anne. A force was now raised for the invasion of England; Warwick landed at its head, at Plymouth, on the 13th of September, and immediately proclaimed Henry VI.; Edward, who was in Yorkshire, fled to the town of Lynn, and there taking ship, on the 3rd of October, made his escape to Alkmaar in Holland. On the 6th Warwick and Clarence entered London in triumph, and taking Henry from the Tower, conducted him with the crown on his head to the cathedral of St. Paul's. Warwick was now formally restored by parliament to his offices of chamberlain of England and captain of Calais, with the addition of that of lord high admiral; his brother, the Archbishop of York, was again made chancellor; his other brother, now Marquis of Montague, for which title he had a few months before been forced to exchange that of Earl of Northumberland with the estates of the Percies, was restored to the wardenship of the East Marches. But all this lasted only a few months. On the

14th of March, 1471, Edward, secretly assisted by his brother-in-law the Duke of Burgundy, landed at Ravenspur, in Yorkshire. First Clarence was won over, and then the Archbishop of York. On the 14th of April the two armies met at Barnet; and there the Lancastrians were defeated: and Warwick, their commander, and his brother, Montague, slain. Their bodies were afterwards exposed for three days in St. Paul's, and then interred in the abbey of Bisham, in Berkshire.

By his wife, Anne de Beauchamp, who survived him many years, and was after his death reduced to great poverty, till she was restored to her estates by act of parliament after the accession of Henry VII. the Earl of Warwick left only his two daughters already mentioned. The eldest, Isabella, who died in 1477, had by her husband, the Duke of Clarence, who was put to death in 1478, a son Edward, who was styled Earl of Warwick, and was beheaded on Tower Hill in 1499; and a daughter Margaret, who was created Countess of Salisbury in 1513, and was also executed on Tower Hill, at the age of seventy, in 1541. By her husband, Sir Reginald Pole, knight, she was the mother of the celebrated Cardinal Pole, and of three other sons and a daughter. Warwick's second daughter, Anne, whose first husband, Edward, Prince of Wales, was murdered in 1471, after the battle of Tewkesbury, was married the next year to the Duke of Gloucester, afterwards Richard III., and died in 1485. By Richard she had one son, Edward, who was born in 1473, and died in 1484.

WARWICK, JOHN DUDLEY, EARL OF, and DUKE OF NORTHUMBERLAND, K.G., was the eldest son of Edmund Dudley, Esq., a grandson of the Lord Dudley, and infamous as the instrument, along with Empson, of the extortions of Henry VII., for his share in which he was beheaded on Tower Hill, 18th August 1510. His mother was Elizabeth Grey, the principality instrumental in the capture of Boulogne, he was appointed to the government of that place as the king's lieutenant; and in 1546 he received a patent constituting him commander of all the king's forces at sea for the war against France. Finally, the Viscount L'Isle was one of the sixteen persons nominated by Henry in his will as his executors for carrying on the government during the minority of his successor.

For some time Dudley went, to all appearance cordially enough, along with the majority of the council of government, or rather with the whole of that body after Southampton was turned out, in supporting the authority of the Earl of Hertford, now become Duke of Somerset and Protector of the Realm. It had been originally intended to make him Earl of Coventry; but on the 17th of February 1547, he was created Earl of Warwick, his pretension to which ancient dignity consisted in his mother having been the daughter of John Talbot, the first Viscount L'Isle, whose mother was Margaret Beauchamp, a daughter by his first wife, of Richard Beauchamp, Earl of Warwick, who died in 1439. Before the end of the year also he exchanged his post of high admiral (which was granted for Somerset's brother Sir Thomas Seymour, made at the same time Baron Seymour of Sudley) for that of lord great chamberlain.

Warwick had greatly distinguished himself in the expedition to Scotland in the autumn of 1547, and in the battle of Pinkey, gained over the Scots on the 10th of September; and when it was found necessary to send an armed force against the Norfolk rebels in the summer of 1549, "that noble chieftain and valiant earl," as Holinshed calls him, was thought the fittest person to be entrusted with the command. The rebels were attacked, and their whole force dispersed, by the earl at Dussingdale on the 10th of August. Soon after this we find Warwick openly disputing the supremacy with the Protector. According to Burnet, his instigator was the ex-chancellor Southampton, who, although no longer taking any share in the government, was at this time secretly exerting all his industry to make a party against Somerset. The course and issue of the contest between the two rivals are related under the head of EDWARD VI. Somerset was deposed from his office of Protector and sent to the Tower in October of this year; then there was an apparent reconcilement between the old and the new dictator, during which, in the beginning of June 1550, Warwick's eldest son, Lord L'Isle, was married to Somerset's daughter, the Lady Anne Seymour. Warwick was created Duke of Northumberland on the 11th of October 1551; and Somerset was brought to the block on the 22nd of January 1552. In the beginning of May following the Duke of Northumberland's fourth son, the Lord Guildford Dudley, was married to the Lady Jane Grey, daughter of Frances, duchess of Suffolk, and great-granddaughter of Henry VII., through his daughter the Princess Mary, who had been married first to Louis XII of France, and then to Charles Brandon, Duke of Suffolk. Edward died on the 6th of July, leaving the succession by will to Lady Jane Grey (or Dudley). The event was kept concealed for a few days; but at last, on the evening of the 10th, Lady Jane was proclaimed queen. On the 14th, Northumberland left London at the head of a force of 2000 foot and 2000 horse, to meet the adherents of Mary: he advanced as far as St. Edmund's-bury, and then returned to Cambridge, where, losing all hope, he proclaimed Queen Mary on the 20th. But the same day he was arrested by the Earl of Arundel; on the 25th he was committed to the Tower; on the 18th of August he was arraigned of high treason, along with his eldest son, before the lord high steward, in Westminster Hall: both were found guilty, but only the father was executed; he suffered on Tower Hill on Tuesday the 22nd of August. To the general surprise he professed in his last moments that he died "in the true Catholic" (meaning the Roman Catholic) faith; and that, notwithstanding his profession of Protestantism, this had been his real religion all his life.

By his wife Jane, daughter of Sir Edward Guildford, who died in 1555, in her forty-sixth year, Northumberland had eight sons and five daughters. Of the sons two died before their father, the eldest, Henry, having been killed at the age of nineteen at the siege of Boulogne; the third, John, styled Earl of Warwick, who was condemned along with his father, but reprieved, died in October 1554, a few days after being released from custody; the fourth, Guildford, was executed along with his wife, the Lady Jane Grey, on the 12th of February 1554; the fifth, Ambrose, was restored in blood by Queen Elizabeth, was created Baron L'Isle, 25th December 1561, and the next day Earl of Warwick, and died without issue in 1589; the sixth, Robert, was the famous Earl of Leicester, the powerful favourite of the next reign; the seventh, Henry, was killed at the siege of St. Quintin's in 1557; the eighth died young.

WASHINGTON, GEORGE, was born at Bridges Creek, in Westmoreland county, Virginia, on the 22nd of February 1732. The first of his family who settled in Virginia was John Washington, but their ancestors are believed to have been from Lancashire, while the ancient stock of the family is traced to the De Wessyngtons of Durham. George Washington's father, Augustine, who died after a sudden and short illness in 1743, was twice married. At his death he left two surviving sons by the first marriage, and by the second four sons (of whom George was the eldest) and a daughter. The mother of George Washington survived to see her son president. Augustine Washington left all his children in a state of comparative independence. His eldest son by the first marriage he left as, by the laws then in force, heir-at-law, to the family estate on the Potomac, afterwards called Mount Vernon) of twenty-five hundred acres, and shares in iron-works situated in Virginia and Maryland; to the second, an estate in Westmoreland. Confiding in the prudence of his widow, he directed that the proceeds of all the property of her children should be at her disposal till they should respectively come of age: to George were left the lands and mansion occupied by his father at his decease: to each of the other sons an estate of six or seven hundred acres: a suitable provision was made for the daughter.

George Washington was indebted for all the education he received to one of the common schools of the province, in which little was taught beyond reading, writing, and accounts. He left it before he had completed his sixteenth year: the last two years of his attendance had been devoted to the study of geometry, trigonometry, and surveying. He had learned to use logarithms. It is doubtful whether he ever received any instruction in the grammar of his own language: he never even commenced the study of the classical languages; and although, when the French officers under Rochambeau were in America, he attempted to acquire their language, it appears to have been without success. From his thirteenth year he evinced a turn for mastering the forms of deeds, constructing diagrams, and preparing tabular statements. His juvenile manuscripts have been preserved; the handwriting is neat, but stiff. During the last summer he was at school he surveyed the fields adjoining the school-house and the adjoining plantations, entering his measurements and calculations in a respectable field-book. He compiled about the same time, from various sources, 'Rules of Behaviour in Company and Conversation.' Some selections in rhyme appear in his manuscripts, but the passages appear to have been selected for the moral or religious sentiments they express, not from any taste for poetry. When a boy, he was fond of forming his schoolmates into companies, who paraded and fought mimic battles, in which he always commanded one of the parties. He cultivated with ardour all athletic exercises. His demeanour and conduct at school are said to have won the deference of the other boys, who were accustomed to make him the arbiter of their disputes.

From the time of his leaving school till the latter part of 1753, Washington was unconsciously preparing himself for the duties he had afterwards to discharge. An attempt made to have him entered in the royal navy, in 1746, was frustrated by the interposition of his mother. The winter of 1748-49 he passed at Mount Vernon, then the seat of his brother Lawrence, in the study of mathematics

Digitized by Google

and the exercise of practical surveying. George was introduced about this time to the family of Lord Fairfax, his brother having married the daughter of William Fairfax, a member of the colonial council, and a distant relation of that nobleman. The immense tracts of wild lands belonging to Lord Fairfax, in the valleys of the Alleghany mountains, had never been surveyed: he had formed a favourable estimate of the talents of young Washington, and entrusted the task to him. His first essay was on some lands situated on the south branch of the Potomac, seventy miles above its junction with the main branch. Although performed in an almost impenetrable country, while winter yet lingered in the valleys, by a youth who had only a month before completed his sixteenth year, it gave so much satisfaction that he soon after received a commission to continue the survey, an appointment which gave authority to his surveys, and enabled him to enter them in the county offices.

The next three years were devoted without intermission, except in the winter months, to his profession. There were few surveyors in Virginia, and the demand for their services was consequently great, and their remuneration ample. Washington spent a considerable portion of these three years among the Alleghanies; the exposures and hardships of the wilderness could be endured only for a few weeks together. He recruited his strength by surveying at intervals tracts and farms in the settled districts. Even at that early age his regular habits enabled him to acquire some property; and his probity and business talent obtained for him the confidence of the leading men of the colony.

At the time he attained his nineteenth year the frontiers were threatened with Indian depredations and French encroachments. To meet this danger the province was divided into military districts, to each of which an adjutant-general with the rank of major was appointed. George Washington was commissioned to one of these districts, with a salary of 100*l.* per annum. There were many provincial officers (his brother among the number) in Virginia who had served in the expedition against Carthagena and in the West Indies. Under them he studied military exercises and tactics, entering with alacrity and zeal into the duties of office. These pursuits were only varied by a voyage to Barbadoes, and a residence of some months in that colony, in company with his brother Lawrence, who was sent there by his physicians to seek relief from a pulmonary complaint. Fragments of his journal kept by George Washington on this occasion have been preserved; they evince an interest in a wide range of subjects, and habits of minute observation. At sea the logbook was daily copied, and the application of his favourite mathematics to navigation studied; in the island, the soil, agricultural products, modes of culture, fruits, commerce, military forts, fortifications, manners of the inhabitants, municipal regulations and government, all were noted in his journal. Lawrence Washington died in July 1752, leaving a wife and infant daughter, and upon George, although the youngest executor, was devolved the whole management of the property in which he had a residuary interest. The affairs were extensive and complicated, and engrossed much of his time and thoughts for several months. His public duties were not however neglected. Soon after the arrival of Governor Dinwiddie the number of military divisions was reduced to four; the second was allotted to Washington, with the rank of lieutenant-colonel. It included several counties, which he had to visit at stated intervals, to train and instruct the military officers, inspect the men, arms, and accoutrements, and establish a uniform system of manœuvres and discipline.

In 1753 the French in Canada pushed troops across the lakes, and at the same time bodies of armed men ascended from New Orleans to form a junction with them, and establish themselves on the upper waters of the Ohio. Governor Dinwiddie resolved to send a commissioner, to confer with the French officer in command, and learn by what authority he occupied a territory claimed by the British. This charge required a man of discretion, accustomed to travel in the woods, and familiar with Indian manners. Washington was selected, notwithstanding his youth, as possessed of these requisites. He set out from Williamsburg on the 31st of October 1753, and returned on the 16th of January 1754. He discovered that a permanent settlement was contemplated by the French within the British territory, and, notwithstanding the vigilance of the garrison, he contrived to bring back with him a plan of their fort on a branch of French Creek, 15 miles south of Lake Erie, and an accurate description of its form, size, construction, cannon, and barracks.

In March 1754, the military establishment of the colony was increased to six companies: Colonel Fry, an Englishman of scientific acquirements and gentlemanly manners, was placed at the head of them, and Washington was appointed second in command. His first campaign was a trying but useful school for him. He was pushed forward with three small companies to occupy the outposts of the Ohio, in front of a superior French force, and unsupported by his commanding officer. Relying upon his own resources and the friendship of the Indians, Washington pushed boldly on. On the 27th of May he encountered and defeated a detachment of the French army under M. de Jumonville, who fell in the action. Soon after Colonel Fry died suddenly, and the chief command devolved upon Washington. Innis, the commander of the North Carolina troops, was, it is true, placed over his head, but the new commander never took the field. An ill-timed parsimony had occasioned disgust among the soldiers, but Washington remained unshaken. Anticipating that a strong detachment would be sent against him from Fort Duquesne as soon as Jumonville's defeat was known there, he entrenched himself on the Great Meadows. The advance of the French in force obliged him to retreat, but this operation he performed in a manner that elicited a vote of thanks from the House of Burgesses.

In 1755 Colonel Washington acceded to the request of General Braddock to take part in the campaign as one of his military family, retaining his former rank. When privately consulted by Braddock, "I urged him," wrote Washington, "in the warmest terms I was able, to push forward, if he even did it with a small but chosen band, with what artillery and light stores were necessary, leaving the heavy artillery and baggage to follow with the rear division by slow and easy marches." This advice prevailed. Washington was however attacked by a violent fever, in consequence of which he was only able to rejoin the army on the evening before the battle of the Monongahela. In that fatal affair he exposed himself with the most reckless bravery, and when the soldiers were finally put to the rout, hastened to the rear division to order up horses and waggons for the wounded. The panic-struck army dispersed on all sides, and Washington retired to Mount Vernon, which had now, by the death of his brother's daughter without issue, become his own property. His bravery was universally admitted, and it was known that latterly his prudent counsels had been disregarded.

In the autumn of the same year he was appointed to re-organise the provincial troops. He retained the command of them till the close of the campaign of 1758. The tardiness and irresolution of provincial assemblies and governors confined him to act during much of this time upon the defensive; but to the necessity hence imposed upon him of projecting a chain of defensive posts for the Ohio frontier, he was indebted for the mastery in this kind of war, which afterwards availed him so much. Till 1758 the Virginia troops remained on the footing of militia, and Washington had ample opportunities to convince himself of the utter worthlessness of a militia in time of war: in the beginning of that year he urged upon the government to organise them on the same footing as the royal forces. At the same time that Washington's experience was extending, his sentiments of allegiance were weakened by the reluctance with which the claims of the provincial officers were admitted, and the unreserved preference uniformly given to the officers of the regular army. At the close of 1758 he resigned his commission, and retired into private life.

On the 6th of January 1759, he married Mrs. Martha Custis, a young widow, with two children. "Mr. Custis," says Mr. Sparks, "had left large landed estates, and 45,000*l.* sterling in money, one-third of this property she held in her own right; the other two-thirds being equally divided between her two children." Washington had a considerable fortune of his own at the time of his marriage—the estate at Mount Vernon, and large tracts of excellent land, which he had selected during his surveying expeditions, and obtained grants of at different times. He now devoted himself to the management of this extensive property and to the guardianship of Mrs. Washington's children, and till the commencement of 1766 was, in appearance at least, principally occupied with these and domestic concerns. He found however for public civil duties. He had been elected a member of the House of Burgesses before he resigned his commission; and although there were commonly two and sometimes three sessions in every year, he was punctual in his attendance from the beginning to the end of each. During the periods of his attendance in the legislature, he was frequent in his attendance on such theatrical exhibitions as were then presented in America, and lived on terms of intimacy with the most eminent men of Virginia. At Mount Vernon he practised on a large scale the hospitality for which the southern planters have ever been distinguished. His chief diversion in the country was the chace. He exported the produce of his estates to London, Liverpool, and Bristol, and imported everything required for his property and domestic establishment. His industry was equal to his enterprise; his daybooks, ledgers, and letter-books were all kept by himself; he drew up his own contracts and deeds. In the House of Burgesses he seldom spoke, but nothing escaped his notice, and his opinion was eagerly sought and followed. He assumed trusts at the solicitation of friends, and was much in request as an arbitrator. He was, probably without being himself aware of it, establishing a wide and strong influence, which no person suspected till the time arrived for exercising it.

On the 4th of March, 1773, Lord Dunmore prorogued the intractable House of Burgesses. Washington had been a close observer of every previous movement in his country, though it was not in his nature to play the agitator. He had expressed his disapprobation of the stamp-act in unqualified terms. The non-importation agreement, drawn up by George Mason, in 1769, was presented to the members of the dissolved House of Burgesses by Washington. In 1773 he supported the resolutions instituting a committee of correspondence and recommending the legislatures of the other colonies to do the same. He represented Fairfax county in the Convention which met at Williamsburg, in August 1774, and was appointed by it one of the six Virginian delegates to the first general Congress. On his return from Congress he was virtually placed in command of the Virginian Independent Companies. In the spring of 1775 he devised a plan for the more

Digitized by Google

complete military organisation of Virginia. And on the 15th of June of that year he was elected commander-in-chief of the Continental army by Congress.

The portion of Washington's life which we have hitherto been passing in review may be considered as his probationary period—the time during which he was training himself for the great business of his life. His subsequent career naturally subdivides itself into two periods—that of his military command, and that of his presidency. In the former we have Washington the soldier; in the latter, Washington the statesman. His avocations from 1748 to 1775 were as good a school as can well be conceived for acquiring the accomplishments of either character. His early intimacy and connections with the Fairfax family had taught him to look on society with the eyes of the class which takes a part in government. His familiarity with applied mathematics and his experience as a surveyor on the wild frontier lands had made him master of that most important branch of knowledge for a commander—the structure of the country. His experience as a parade officer, as a partisan on the frontier, and as the commander of considerable bodies of disciplined troops, had taught him the principles both of the war of detail and the war of large masses. On the other hand, his punctual habits of business, his familiarity with the details both of agriculture and commerce, and the experience he had acquired as trustee, arbitrator, and member of the House of Burgesses, were so many preparatory studies for the duties of the statesman. He commenced his great task of first liberating and then governing a nation, with all the advantages of this varied experience, in his forty-third year, an age at which the physical vigour is not diminished and when the intellect fully ripe. He persevered in it, with a brief interval of repose, for upwards of twenty years, with almost uniform success, and with an exemption from the faults of great leaders unparalleled in history.

Washington was elected commander-in-chief on the 15th of June 1775; he resigned his commission into the hands of the president of Congress on the 23rd of December, 1783.

A few days after his appointment he left Philadelphia to join the army at Cambridge, Massachusetts. The particulars of the battle of Bunker's Hill reached him at New York, and increased his anxiety to hasten forward. He arrived at Cambridge on the 2nd of July, and assumed the command next day. The army, including sick and wounded, amounted to about 17,000 men, collected on the spur of the moment, occupying a range of posts disproportioned to their numbers, and almost under the guns of the enemy. There were few stores, no military chest, and no general organisation. And the new commander discovered with astonishment that there was not powder enough in the camp to supply nine cartridges for each man. There was much discontent among the general officers on account of the manner in which the appointments had been made by Congress, and the subordinate officers and privates formed themselves into parties. Referring their complaints to Congress, Washington proceeded to mature his plans. The army was formed into six brigades of six regiments each; the troops of the same colony were, whenever it was practicable, brought together and placed under a commander from that colony. All the officers were commissioned anew by Congress, and by degrees a continental army was formed. He kept up an uninterrupted correspondence with Congress, which, though tardily, adopted all his important suggestions. He corresponded also with the heads of the provincial governments, and subsequently with the governors and legislatures of the several states. He thus became not only the creator of the American army, but the channel of communication between it and the numerous and complicated depositories of power in the United States.

The army was at first distributed into three grand divisions of two brigades each: the division forming the left wing was stationed at Winter Hill, under Major-General Lee; the centre division at Cambridge, under Major-General Putnam; the right wing at Roxburgh, under Major-General Ward. The head-quarters of the commander-in-chief were with the centre at Cambridge. These positions were maintained with little alteration till far in January 1776. During that interval the regular army, by the departure of many whose term of enlistment had expired, and in consequence of the slow progress of the recruiting, sunk to 9650 men, to whom were added 15,000 militia, who were to remain only till the middle of January. "Search the volumes of history through," Washington wrote at this time, "and I much question whether a case similar to ours is to be found, namely, to maintain a post against the flower of the British troops for six months together without powder, and then to have our army disbanded and another to be raised within the same distance of a reinforced enemy." During this time he detached 1100 men, under Arnold (14th September), in the direction of Canada, and equipped and sent out armed vessels from the New England ports. Occasional cannonades and skirmishes took place at the advanced posts. But no decisive blow could be hazarded; and the patience and fortitude of the commander-in-chief were severely tried by the cabals of the officers, the undisciplined habits of the men, and the pragmatical conduct of the civil authorities.

Towards the end of December 1775, General Howe, who had succeeded Gage in command of the British army, was fitting out part of the fleet in Boston harbour for some secret enterprise. General Lee

was despatched to place New York in a state of defence, but the expedition proved to be destined against North Carolina. Washington became impatient to attack Boston, but was twice overruled by a council of war—on the 16th of January and on the 10th of February 1776. At last, on the 4th of March, the Americans took possession of Dorchester heights; and on the 17th the British evacuated Boston. As soon as the British fleet had put to sea, Washington set out for New York, apprehensive that the enemy might attempt a landing there. It was the 28th of June before the British forces appeared off Sandy Hook; but the deficient means at Washington's command, and the strength of the royalist party in New York, had materially impeded his preparations for defence. The incompetency of some of Washington's officers enabled the enemy to gain easy possession of Long Island on the 27th of August; and the weakness of his army and fears of the soldiers obliged him in succession to evacuate New York, cross the Hudson, and fall back behind the Delaware. Congress at last saw the necessity of raising a regular army of men enlisted for a longer period than a year, and of investing Washington with dictatorial powers. Thus strengthened he remodelled his troops, recrossed the Delaware on the night of the 25th of December, and broke up and drove back the whole of the enemy's line of cantonments on that river. Having thus relieved New Jersey, he again fell back and established his winter-quarters at Morristown in New Jersey.

The campaign of 1777 did not open till the middle of June; and the operations on both sides led for some time to nothing but a series of skirmishes. Washington had received a supply of arms from France, but he was still unable to take the field. He was also kept in suspense as to the real designs of the British commander. It was clearly an object with the English to maintain the command of the Hudson, keep up the communication between New York and Canada, and isolate the eastern from the western states. But there was also danger in leaving Philadelphia unprotected. At last the British landed at the Head of Elk. The Americans were defeated on the Brandywine. Congress undismayed invested Washington with fresh powers. The Americans were again beaten at Germantown in Pennsylvania on the 4th of October, but a method of improvement was visible in the fighting of part of their troops. The British took possession of Philadelphia after the battle. On the 18th of December Washington began to construct a fortified encampment at Valley Forge. He was at this time harassed by cabals among the general officers. Gates, Conway, Mifflin, Wilkes, and Mifflin, all a small party in Congress, conspired to have him removed from the command. The good sense of the majority in Congress frustrated the plot, and the attachment of the soldiers, heightened by the enthusiasm with which Lafayette and the Polish chiefs threw their weight into Washington's scale, kept the army in good temper.

The winter was however a trying one for the troops. Owing to the derangement of the commissariat, the men were inadequately supplied with clothes and blankets, and at times even with food. With the opening of spring Washington was obliged to busy himself to plan an entire remodelling of the army. He invited the general officers to state their sentiments on the subject in writing. Congress at the same time appointed a commission to visit the camp, which remained there three months. With great difficulty the commander-in-chief wrung from Congress the promise of half pay for seven years for the officers, and a gratuity of 80 dollars for each non-commissioned officer and soldier who should continue in the service to the end of the war. The ratification of the treaty with France was cel-brated in the camp with great solemnity on the 6th of May. The British in Philadelphia, though only twenty miles distant from the American camp, allowed the winter and spring to pass without making any attempt to assault it. These concurring circumstances enabled Washington to bring his troops into the field in 1778 in tolerable spirits. An offensive campaign was however determined on by the council of war. Howe evacuated Philadelphia on the 18th of June, and Washington crossed the Delaware with his whole army. He attacked the enemy at Monmouth on the 28th; night put an end to the attack, and under its cover the British continued their retreat. Washington advanced to the Hudson, and crossing it at King's Ferry, encamped near White Plains. Count d'Estaing, with a French fleet of twelve ships of the line and four frigates, arrived about the same time off Sandy Hook. The American army was engaged for four months in arrangements for the defence of New England, during which interval the English laid New Jersey waste. Washington in December retired into winter-quarters—distributing his troops in a line of cantonments around New York extending from Long Island Sound to the Delaware.

During the whole of 1779 Washington retained his position in the highlands of the Hudson, and remained on the defensive. An expedition fitted out to chastise the Indians was successful. The British burned a number of towns on the coast, but Washington covered New Jersey. Baron Steuben effected an improvement in the discipline and evolutions of the American army.

Lafayette returned from a visit to France before the end of April 1780, with the intelligence that the French government had fitted out an armament of land and naval forces which might soon be expected in the United States. Rochambeau arrived at Newport, Rhode Island, on the 10th of July. A plan of combined operations against

Digitized by Google

the British in New York was concerted by Washington and the French commanders. The naval superiority of the English however prevented anything being done, and the year wore away unmarked by any incidents, except the treason of Arnold and the execution of André. Congress, yielding at last to Washington's representations, decreed that all troops to be raised in future should be enlisted to serve during the war, and that all officers who continued in service to the end of the war should be entitled to half-pay for life. The army went into winter-quarters towards the end of November at the Pennsylvanian line near Morristown, the New Jersey regiments at Pampton, and the eastern troops in the Highlands, while the head-quarters were at New Windsor, on the Hudson.

The year 1781 opened with a mutiny in the Pennsylvania and Jersey troops, which was subdued by the promptitude and vigour of Washington. He was now strengthened not only by a French auxiliary army, but by liberal supplies from France. The main source of his weakness was the utter want of a civil government to support him. The Congress, which made war, declared independence, formed treaties of alliance, sent members to foreign courts, emitted paper currency, and pledged the credit of all the states for its redemption, "ventured," says Mr. Sparkes, "only to *recommend* to the states to raise troops, levy taxes, clothe and feed their naked and starving soldiers." Tilly with the French fleet entered the Chesapeake in February, but returned without injuring Arnold's squadron. Lafayette, whom Washington had detached at the same time with 1200 men to Virginia, held Cornwallis, who had advanced from North Carolina, in check. Washington had repeated interviews with the French commanders to concert a plan of campaign. On the 4th of July he encamped near Dobb's Ferry, and was joined on the 6th by the French army under Count Rochambeau. A fruitless attempt on New York, and a letter intimating that De Grasse, who commanded the French fleet, could not remain on the coast after October, decided him to relinquish the siege of New York, and to advance into Virginia with all the French troops and as many of the American as could be spared from the defence of the posts on the Hudson and in the Highlands. Washington and Rochambeau reached Lafayette's head-quarters at Williamsburg in Virginia, on the 14th of September. De Grasse had previously entered the Chesapeake and landed 3000 men from the West Indies, who united with Lafayette. Cornwallis took possession of York Town and Gloucester on the opposite side of York River in Virginia. The American and French generals advanced from Williamsburg and completely invested York Town on the 30th of September. Cornwallis proposed a cessation of hostilities on the 17th of October, and signed the articles of capitulation on the 19th. Two thousand continental troops were marched to reinforce General Greene in the south; the French army remained in Virginia; its head-quarters at Williamsburg; the American forces were marched into winter cantonments in New Jersey and on the Hudson.

Hitherto Washington had to struggle against the apathy engendered by hope; now he had to check the rashness which sprung from an over-estimate of success. "Whatever," he said, "may be the policy of European courts during this winter, their negociations will prove too precarious a dependence for us to trust to. Our wisdom should dictate a serious preparation for war, and, in that case, we shall find ourselves in a situation secure against every event." Congress concurred in these sentiments. The commander-in-chief addressed circular letters to the governors of all the states, urging them to make strenuous exertions for carrying on the war. In the middle of April he joined the army and established his head-quarters at Newburgh. Little progress was made by the states in filling up their quotas, and on the 8th of May he was obliged to remonstrate with them in energetic terms. Great discontent prevailed in the army, on account of the treatment it had experienced, and a wish spread that Washington should establish a monarchy in the United States. In the mean time negociations for peace were commenced, the French army withdrawn, and the American army, after an inactive summer, was sent back into winter-quarters. The winter passed in an angry correspondence between the officers of the army and Congress. An address from Washington (12th of March 1783) was required to restore the good temper of the officers. Having pacified them, he became their advocate with Congress, and obtained the concession of their demands. On the 8th of June he addressed his last official communication, a circular letter to the governors of the states, urging upon them :—an indissoluble union of the states; regard to public justice; the adoption of a proper military peace-establishment; and mutual concessions on the part of the different states. On the 25th of November the British evacuated New York. On the 4th of December Washington took a solemn farewell of the officers of the army. And on the 23rd of December he resigned his commission to Congress.

We must pass briefly over the interval which separates the epoch of Washington the soldier from that of Washington the statesman—the few years which elapsed between the resignation of his command in December 1783, and his election as first president of the United States in February 1789. It was for him no period of idleness. In addition to a liberal increase of hospitality at Mount Vernon, and indefatigable attention to the management of his large estates, he actively promoted in his own state schemes of internal navigation, acts for encouraging

education, and plans for the civilisation of the Indians. He acted as delegate from Virginia to the Convention which framed the first constitution of the United States. We now turn to contemplate him as president.

Washington left Mount Vernon for New York, which was then the seat of Congress, on the 16th of April 1789. His journey was a triumphal procession. He took the oath of office on the 30th of April, with religious services, processions, and other solemnities, which the ultra-republican party have since done away with.

The new president's first step was to request elaborate reports from the secretary of foreign affairs, the secretary of war, and the commissioners of the treasury. The reports he read, and condensed with his own hand, particularly those of the treasury board. The voluminous official correspondence in the public archives, from the time of the treaty of peace till the time he entered on the presidency, he read, abridged, and studied, with the view of fixing in his mind every important point that had been discussed, and the history of what had been done.

His arrangements for the transaction of business and reception of visitors were characterised by the same spirit of order which had marked him when a boy and at the head of the army. Every Tuesday, between the hours of three and four, he was prepared to receive such persons as chose to call. Every Friday afternoon the rooms were open in like manner for visits to Mrs. Washington. He accepted no invitations to dinner, but invited to his own table foreign ministers, officers of the government, and others in such numbers as his domestic establishment could accommodate. The rest of the week-days were devoted to business appointments. No visits were received on Sunday, or promiscuous company admitted; he attended church regularly, and the rest of that day was his own.

The organisation of the executive departments was decreed by act of Congress during the first session. They were the departments of foreign affairs (afterwards called the department of state, and including both foreign and domestic affairs), of the treasury, and of war. It devolved upon the president to select proper persons to fill the several offices. Jefferson was appointed secretary of state; Hamilton, secretary of the treasury; and Knox, secretary of war. Randolph had the post of attorney-general. The appointments to the supreme court cost him much anxious scrutiny. Jay was made chief-justice. After making these appointments he undertook a tour through the eastern states, and returned to be present at the opening of Congress, in January 1790.

In his opening speech he recommended to the attention of the legislature—a provision for the common defence; laws for naturalising foreigners; a uniform system of currency, weights, and measures; the encouragement of agriculture, commerce, and manufactures; the promotion of science and literature; and an effective system for the support of public credit. The last topic gave rise to protracted and vehement debates. At last, Hamilton's plan for funding all the domestic debts was carried by a small majority in both Houses of Congress. The president suppressed his sentiments on the subject while it was under debate in Congress, but he approved the act for funding the public debt, and was from conviction a decided friend to the measure. The foreign relations of the country, though not complicated, were in an unsettled condition. Washington despatched Gouverneur Morris as a private agent to ascertain the views and intentions of the British ministers. He reluctantly commenced an Indian war, which lasted during the greater part of his administration. For the first year of his presidential term however he was chiefly engaged in ascertaining the actual position of the United States in the system of nations.

The second session of Congress was mainly occupied with debates on the erection of a national bank. The two great sections of public opinion, which have under different names divided the Union since the constitution of 1788, had to take measures taken on their respective grounds on the question of funding the debts. Their organised hostility became more apparent in the debates on the project of a national bank. Both parties were represented in the cabinet: Knox and Hamilton advocated the establishment of the bank; Jefferson and Randolph denounced it as unconstitutional. The contest ended in the establishment of a bank, with a capital of ten millions of dollars, of which eight millions were to be held by individuals, and the rest by government. Again the president avoided showing a leaning to the one or other party, although friendly to the creation of a bank. He requested from each member of the cabinet a statement of his reasons in writing, examined them attentively, and affixed his signature to the act.

The session of 1791 produced the laws for apportioning the representatives, establishing a uniform militia system, and increasing the army. It now became apparent to the most unreflecting that two great parties were in the process of formation. The opponents and supporters of the measures enumerated were, with few exceptions, the opponents and supporters of the funding system and of the national bank. The opponents were jealous of anything that might encroach upon democratic principles; the supporters were distrustful of the power of institutions so simple as those of the United States to preserve tranquility and the cohesion of the state. Jefferson was the head of the democratic, Hamilton of what was afterwards called the

Digitized by Google

Federalist party. Washington endeavoured to reconcile these ardent and incompatible spirits. His own views were more in accordance with those of Hamilton; but he knew Jefferson's value as a statesman, and he felt the importance of the president remaining independent of either party. The two secretaries however continued to diverge in their political course, and ultimately their differences settled into personal enmity.

The president's term of office was drawing to a close, and an anxious wish began to prevail that he should allow himself to be elected for a second term. Jefferson, Hamilton, and Randolph, who did not exactly coincide with either, all shared in this anxiety, and each wrote a long letter to Washington, assigning reasons for his allowing himself to be re-elected. He yielded; and on the 4th of March 1793 he took the oath of office in the senate-chamber.

The first question that came before the cabinet after the re-election rendered more decided the difference which already existed. The European parties, of which the court of St. James's and the French republic were the representatives, were eager to draw the United States into the vortex of their struggle. The president and his cabinet were unanimous in their determination to preserve neutrality; but the aristocratic and democratic sections of the cabinet could not refrain from displaying their respective biases and their jealousy of each other. It having been agreed to receive a minister from the French republic, Hamilton and Knox advocated a qualification in the terms, implying that the relations of the two countries were altered; Jefferson and Randolph opposed it. The proclamation of neutrality was published on the 22d of April 1793.

This wise act was bitterly assailed by the partisans of France. Foreign affairs were mingled with domestic politics, and the Democratic and Federalist parties became avowedly organised. Washington was for a time allowed to keep aloof from the contest—not for a long time. Genet, the French minister, gave orders to fit out privateers at Charleston to commit hostilities against the commerce of nations at peace with America. The government of the United States issued in August a declaration that no privateers fitted out in this manner should find refuge in their harbours. In June, and again in November, the British cabinet issued orders to their cruisers to stop and make prize of all vessels laden with provisions for any ports of France or the French colonies. A report was made by the secretary of state near the beginning of the session of 1793-4 respecting the commercial intercourse of the United States with other countries. Two bills were proposed for modifying or removing restrictions: first, by amicable arrangements with foreign powers; second, by countervailing acts of the legislature. Soon after the secretary of state resigned, and was succeeded by Randolph. Mr. Jefferson's report gave rise to Mr. Madison's celebrated commercial resolutions. The friends of the administration from which Jefferson had seceded imagined they saw hostility to England and under-favour to France. The opposite party deemed them no more than necessary for the protection of the country. Mr. Madison's plan, with some modifications, passed the House of Representatives, but was rejected in the Senate by the casting vote of the vice-president.

A circumstance insignificant in itself increased the bitterness of the contest out of doors. Democratic societies had been formed on the model of the Jacobin club of France. Washington regarded them with alarm, and the unmeasured expression of his sentiments on this head subjected him to a share in the attacks made upon the party accused of undue fondness for England and English institutions.

Advices from the American minister in London representing that the British cabinet was disposed to settle the differences between the two countries amicably, Washington nominated Mr. Jay to the Senate as envoy-extraordinary to the court of Great Britain. The nomination, though strenuously opposed by the democratic party, was confirmed in the Senate by a majority of two to one. The treaty negociated by Jay was received at the seat of government in March, 1795, soon after the session of Congress closed. The president summoned the Senate to meet in June to ratify it. The treaty was ratified. Before the treaty was signed by the president it was surreptitiously published. It was vehemently condemned, and public meetings against it were held to intimidate the executive. The president nevertheless signed the treaty on the 18th of August. When Congress met in March, 1796, a resolution was carried by a large majority in the House of Representatives, requesting the president to lay before the house the instructions to Mr. Jay, the correspondence, and other documents relating to the negociation. Washington declined to furnish the papers; a vehement debate ensued; but in the end the majority hostile to the treaty yielded to the exigency of the case, and united in passing laws for its fulfilment.

The two houses of Congress met again in December. Washington had published on the 15th of September his farewell address to the United States. He now delivered his last speech to Congress, and took occasion to urge upon that body the gradual increase of the navy, a provision for the encouragement of agriculture and manufactures, the establishment of a national university, and of a military academy. Little was done during the session: public attention was engrossed by the president's election. Adams, the federalist candidate, had the highest number of voters; Jefferson, the democratic candidate (who was consequently declared vice-president), the next. Washington's commanding character and isolation from party had preserved this degree of strength to the holders of his own political views; his successor Adams being a party man, by his injudicious identification of himself with the federalists turned the scale in favour of the democrats. Washington was present as a spectator at the installation of his successor, and immediately afterwards returned to Mount Vernon.

He survived till the 14th of December 1799, but, except when summoned in May 1798, to take the command of the provincial army on the prospect of a war with France, did not again engage in public business.

The character of Washington is one of simple and substantial greatness. His passions were vehement, but concentrated, and thoroughly under control. An irresistible strength of will was the secret of his power. Luckily for his country this strength of will was combined with a singularly well-balanced mind, with much sagacity, much benevolence, much love of justice. Without possessing a spark of what may be called genius, Washington was endowed with a rare quickness of perception and soundness of judgment, and an eager desire of knowledge. His extremely methodical habits, which in a person engaged in less important matters would have almost appeared ridiculous, enabled him to find time for everything, and were linked with a talent for organisation. During the War of Independence he was the defensive force of America: wanting him, it would almost appear as if the democratic mass must have resolved itself into its elements. To place Washington as a warrior on a footing with the Cæsars, Napoleons, and Wellingtons, would be absurd. He lost more battles than ever he gained, and he lost them from defective strategy. But he kept an army together and kept up resistance to the enemy under more adverse circumstances than any other general ever did. His services as a statesman were pretty similar in kind. He upheld the organisation of the American state during the first eight years of its existence, amid the storms of Jacobinical democracy, and gave it time to consolidate. No other American but himself could have done this: for of all the American leaders, he was the only one of whom men felt that he differed from themselves. The rest were soldiers or civilians, federalists or democrats, but he was Washington. The awe and reverence felt for him was blended with affection for his kindly qualities, and except for a brief period towards the close of his second presidential term, there has been but one sentiment entertained towards him throughout the Union—that of reverential love. He is one of those rare natures whom greatness followed without his appearing to seek for it.

Jefferson's sketch of Washington's character, quoted by Tucker, with the remark that it "has every appearance of candour, as it praises without extravagance, qualifies its commendations with caution and moderation, and does not blame at all," is valuable coming from one who long enjoyed opportunities of close personal observation, was a shrewd judge of character, and the leader of the party opposed to Washington's general policy. It is as follows:—

"His mind was great and powerful, without being of the very first order; his penetration strong, though not so acute as that of a Newton, Bacon, or Locke, and, as far as he saw, no judgment was ever sounder. It was slow in operation, being little aided by invention or imagination, but sure in conclusion. Hence the common remark of his officers, of the advantage he derived from councils of war, where hearing all suggestions, he selected whatever was best; and calmly as no general ever planned his battles more judiciously. But if deranged during the course of action, if any member of his plan was dislocated by sudden circumstances, he was slow in a readjustment. The consequence was, that he often failed in the field, and rarely against an enemy in station, as at Boston and York. He was incapable of fear, meeting personal dangers with the calmest unconcern. Perhaps the strongest feature in his character was prudence, never acting until every circumstance, every consideration was maturely weighed; refraining, if he saw a doubt, but when once decided, going through with his purpose, whatever obstacles opposed. His integrity was the most pure, his justice the most inflexible I have ever known; no motives of interest or consanguinity, of friendship or hatred, being able to bias his decision. He was indeed in every sense of the word a good man, and a great one. His temper was naturally irritable and high-toned: but reflection and resolution had obtained a firm and habitual ascendancy over it. If ever however it broke its bonds, he was most tremendous in his wrath. In his expenses he was honourable, but exact; liberal in contributions to whatever promised utility; but frowning and unyielding to all visionary projects, and all unworthy calls on his charity. His heart was not warm in its affections: but he exactly calculated every man's value, and gave him a solid esteem proportioned to it. His person was fine, his stature exactly what one would wish; his deportment easy, erect, and noble: the best horseman of his age, and the most graceful figure that could be seen on horseback. Although in the circle of his friends, where he might be unreserved with safety, he took a free share in conversation, his colloquial talents were not above mediocrity, possessing neither copiousness of ideas nor fluency of words. In public, when called on for a sudden opinion, he was unready, short, and embarrassed. Yet he wrote readily, rather diffusely, in an easy and correct style. This he had acquired by conversation and the world, for his education was merely reading, writing, and common arithmetic, to which he added surveying. His time was employed in action chiefly, reading

Digitized by Google

little, and that only in agriculture and English history. His correspondence became necessarily extensive, and with journalising his agricultural proceedings occupied most of his leisure hours within doors. On the whole his character was in its mass perfect, in nothing bad, in a few points indifferent; and it may truly be said, that never did nature and fortune combine more perfectly to make a man great, and to place him in the same constellation with whatever worthies have merited from man an everlasting remembrance. For his was the singular destiny and merit of leading the armies of his country successfully through an arduous war for the establishment of its independence: of conducting its councils through the birth of a government new in its forms and principles, until it had settled down into a quiet and orderly train; and of scrupulously obeying the laws through the whole of his career, civil and military, of which the history of the world furnishes no other example."

(*Lives of Washington* by Jared Sparkes, Judge Marshall, and Washington Irving; George Tucker, *Life of Thomas Jefferson*; *The Writings of George Washington*, edited by Jared Sparkes.)

WASHINGTON, CAPTAIN JOHN, R.N., F.R.S., Hydrographer to the British Admiralty, entered the navy on the 15th of May 1812, as a first-class volunteer on board the Junon, of 46 guns, Captain James Sanders, fitting for the North American station, where he took part in many operations in the river Chesapeake, assisted in making prize of several of the enemy's vessels, and constituted (the Junon being accompanied by the Narcissus and Barossa frigates) to the complete discomfiture of fifteen gun-boats that had been despatched for the express purpose of capturing the Junon, after an action, fought on the 20th of June 1813, of three hours, in which the latter had only two men killed and three wounded. Removing, as midshipman, in the following October to the Sybille, 44, he sailed in that ship in 1814, under Captain Thomas Forrest, with the Princess Caroline, 74, Captain Hugh Downman, for the latitude of Greenland, in fruitless pursuit of the American commodore Rogers. In November of the same year, having returned to England, he entered the Royal Naval College at Portsmouth. On leaving that institution he was received, in May 1816, on board the Forth, 40, Captain Sir Thomas Louis, under whom he was again employed for upwards of three years on the coast of North America. He then in succession, in 1819 and August 1820, joined the Vengeur, 74, Captain Frederick Lewis Maitland, and the Superb, 78, Captains Thomas White and Adam Mackenzie, both on the South American station, where he remained until some months after his promotion to the rank of lieutenant, which took place on the 1st of January 1821. His next appointment was, on the 15th of February 1823, as first lieutenant to the Parthian, of 10 guns, Captain the Hon. George Barrington, employed on particular service; on the 14th of May 1827, after about two years of half-pay, to the Weazle, 10, Captain John Barnet Dundas, whom he accompanied to the Mediterranean; on the 12th of December following, to the Dartmouth, 42, Captain Thomas Fellowes, on the latter station; and on the 6th of August 1830, to the Royal George, 120, as flag-lieutenant to Sir John Poo Beresford, commander-in-chief at the Nore, continuing to serve under that officer in the Ocean, 80, until advanced to the rank of commander on the 14th of August 1833.

To the active service consequent upon his various appointments, Commander Washington had united the practice of maritime surveying and the related pursuits of a scientific hydrographer and geographer. In 1835 he succeeded Captain Manoochie as secretary of the Royal Geographical Society of London, but resigned that office in 1841, on being appointed to continue the survey of the North Sea, which had for some time been in progress. In the Report of the Council of the Society for that year, it is recorded, that "to his enlightened and unceasing activity must be ascribed in no ordinary degree the great advance which the society has made in securing the confidence and good opinion of the public, and the increasing interest which is now so extensively felt in geographical discoveries and investigations." For the purposes of the survey, he had the command of a steam-vessel and of an accompanying tender, being appointed to the Shearwater steamer on the 16th of March 1841, and to the Blazer on the 29th of January 1843. In these vessels he carried on the minute examination of the North Sea between the latitudes of 62° 10′ and the Flemish and Belgian coasts, and further north towards the Baltic, in completion of the work of the late Captain Hewitt, R.N. During this survey, in which he was continually engaged until the close of 1844, he was occasionally occupied in correcting the existing charts, as the positions of the shoals and the directions of the navigable channels were in many cases become changed; of which singular instances occurred in Yarmouth Roads, through which so many thousand vessels annually pass. On the 16th of March 1842 he had been promoted to the naval rank he now holds, that of post-captain, in compliment to the King of Prussia. The survey was Captain Washington's last service afloat. On the 25th of January 1845 he was appointed a commissioner for inquiring into the state of the rivers, shores, and harbours of the United Kingdom. He was subsequently employed in the Railway and Harbour departments of the Admiralty; and, on the retirement of Rear-Admiral Sir Francis Beaufort, he was elevated to the office of Hydrographer to the Admiralty on the 30th of January 1855, the highest position to which a marine surveyor in the Royal Navy can aspire, and the honour of which is equalled only by its responsibility. When the nature of the duties of this office—involving the superintendence of the national marine surveys and of the construction and revision of the charts on which they are laid down, and which are the guides of navigators in every sea—and the union of scientific with professional qualifications they require, are considered, it must, as a position, be regarded as the high and appropriate reward for previous services in the department to which it belongs.

On the 3rd of September 1833, Captain Washington married Eleonora, youngest daughter of the Rev. H. Askew, rector of Graystock in Cumberland, by whom he has issue.

He was elected a fellow of the Royal Society on the 13th of February 1845, is also a fellow of the Geological and a member of the Royal Geographical societies, and an associate (or non-professional member) of the Institution of Civil Engineers: also a member of the Royal Academy of Sciences of Copenhagen, and of the Geographical societies of Berlin and Paris. In the 'Journal of the Royal Geographical Society' will be found the following communications by Captain Washington:—'Geographical Notice of the Empire of Marocco,' vol. i.; 'Sketch of the Progress of Geography and of the Labours of the Society in 1837-38;' 'Account of Mohammedu-Sinei, a Mandingo,' vol. viii.; 'Analyses of Von Hügel's Kaschmir and the Kingdom of the Sikhs,' and of 'Raper's Navigation and Nautical Astronomy,' vol. x.; 'Analysis of the Government Marine Atlas of Prussia,' vol. xiv. [See SUPPLEMENT.]

WAT TYLER. [RICHARD II.]

WATELET, CLAUDE HENRI, receiver-général des finances, was born at Paris in 1718. Watelet is distinguished as one of the best French critical writers upon art, and he was also an excellent amateur engraver and copper-plate etcher. He was the son of Henri Watelet, receveur-général des finances de l'Orléanois, and was educated at the college of Harcourt. He visited Germany and Italy in his youth, and spent some time at Rome, where he formed a friendship with the French painter Pierre, and became one of the pupils of the French school at Rome. He returned to France, and after residing a short time in society in Paris, he retired to the country-seat of Moulinjoli, belonging to Madame Le Comte. Here he wrote his didactic poem, 'L'Art de Peindre,' which was published in 1761. In the same year he was elected a member of the French Academy. He published also, near the same time, the first part of a work entitled 'De l'Origine et de la Destination des Arts Libéraux:' the second part was never published. After this time he paid a second visit to Italy, in company with his friend Madame Le Comte and the Abbé Copette, having previously visited Holland and Belgium. These journeys were perceived on his journey, and was much noticed by the King of Sardinia and the pope Rezzonico, Clement XIII. He was made member of the academies Della Cruca and of Cortona, and of the Institute of Bologna. After his return to France a second time, he published, in 1774, his 'Essai sur les Jardins;' and in 1775 was published a 'Recueil de quelques Ouvrages de M. Watelet.' This collection contains several dramas. He died at Paris, on the 12th of January, 1786, falling apparently into a quiet sleep. His éloge was read a few days after his death, at a public sitting of the Société Royale de Médecine, by M. Vicq-d'Azyr, the secretary of the society, of which M. Watelet was an associé libre. He was also an honorary member of the French royal academies of painting and architecture, and a member of the academy of Berlin.

The chief work of Watelet's life was his 'Dictionary of the Arts of Painting, Sculpture, and Engraving,' which was not published until after his death—'Dictionnaire des Arts de Peinture, Sculpture, et Gravure,' 5 vols. 8vo, Paris, 1792. Watelet left the work incomplete, and it was finished by M. Levesque of the French Academy of Inscriptions and Belles-Lettres. Watelet etched many plates: Huber, in his 'Manuel des Amateurs,' &c., enumerates 27 portraits in 4to of himself and his friends, after pictures by Cochin; among them portraits of D'Alembert and Madame Le Comte; also 14 pieces in imitation of Rembrandt, and about 20 others in various styles from various masters, and from some of his own designs.

WATERLAND, DANIEL, D.D., an eminent English theologian, was the son of the Rev. Henry Waterland, rector of Wasely or Walsely, in Lincolnshire, where he was born on the 14th of February 1683. After finishing his elementary education at the free school of Lincoln, he was admitted of Magdalen College, Cambridge, in March 1699, obtained a scholarship in December 1702, and was elected a fellow in February 1704. Continuing to reside at the university, and having taken holy orders, he acted for many years as a tutor even after he had been presented by the Earl of Suffolk, in February 1713, to the mastership of his college, and also to the rectory of Ellingham in Norfolk. It was during this period of his life that he drew up and published his 'Advice to a Young Student, with a Method of Study for the first Four Years,' which went through several editions. In 1714 he took his degree of Bachelor of Divinity, on which occasion he greatly distinguished himself by his defence of his thesis, the illegality of Arian subscription, his first opponent being Thomas Sherlock, afterwards bishop of London. Soon after this he was appointed one of the chaplains in ordinary to the king (George I.), and in 1717 he received by command of his majesty, on his visit to the university, the unsolicited honour of a degree of D.D., in which he was some time after incorporated at Oxford.

Digitized by Google

Dr. Waterland appears to have first come forth as a controversialist in 1718, in an answer to Dr. Whitby's Latin disquisitions on Bishop Bull's 'Defence of the Nicene Creed,' and 'An Answer to Dr. Whitby's Reply' to that attack. In 1719 he handled the same subject with more elaboration and effect in 'A Vindication of Christ's Divicity, being a Defence of the Queries, &c., in answer to a Clergyman in the Country.' The 'Queries' had been drawn up some time before for the use of the Rev. John Jackson, rector of Rossington in Yorkshire, who wrote an answer to them, which he submitted to Waterland, and then sent the 'Queries,' his own answer, and Waterland's reply to that, to the press. This publication immediately involved Waterland in a controversy with Dr. Clarke and the Arian party. The longest and most important of Waterland's tracts in this controversy was his next, published in 1723, under the title of 'A Second Vindication of Christ's Divinity.' This was followed the next year by 'A further Defence of Christ's Divinity,' in answer to Clarke's 'Observations' on the Second Defence.

Meanwhile, in 1720, Dr. Waterland had, on the appointment of Bishop Robinson, of London, preached the first course of sermons at the lecture founded by Lady Moyer, which he afterwards published in 8vo, under the title of 'Eight Sermons, &c., in defence of the Divinity of our Lord Jesus Christ.' Next year he was presented by the dean and chapter of St. Paul's to the rectory of St. Austin's and St. Faith's, in the city of London; and in 1723 he was promoted by Archbishop Dawes to the chancellorship of the church of York. The same year he published his 'Critical History of the Athanasian Creed.' In 1727 he was collated to a canonry at Windsor; and in 1730 he was presented by the chapter of Windsor to the vicarage of Twickenham, upon which he resigned his London living, but accepted the archdeaconry of Middlesex from his diocesan Bishop Gibson.

The publication, in 1730, of Dr. Clarke's 'Exposition of the Church Catechism,' drew Waterland into a new controversy both with Clarke and Dr. Sykes. This was followed by another with Tindal, whose 'Christianity as old as the Creation' also appeared in 1730, and was replied to by Waterland, in a work entitled 'Scripture Vindicated,' &c., in 1732. Out of this grew another controversy with Middleton; and that was succeeded by a fourth with the Rev. John Jackson, on the worth of the *à priori* argument for the being of a God, which opposed as it was to Waterland's natural turn of thought, which was critical rather than metaphysical, may be supposed not to have recommended itself to him the more as having been adopted by his great Arian adversary Clarke. In 1734 he published a tract entitled 'The Importance of the Holy Trinity asserted;' and in 1737, in an 8vo volume, 'A Review of the Doctrine of the Eucharist, as laid down in Scripture and Antiquity,' which was the last work he sent to the press. He died on the 23rd of December 1740, at Hardenglas, near Bishop Stortford, and was buried in the church of that village. He had come from Cambridge to consult Dr. Cheselden about his complaint, a nail growing into one of his great toes, which ended in a mortification. He left a widow, whom he had married in 1719, but no children. Two volumes, in 8vo, with a discourse on the Nature of Doctrine of Justification, and another on Infant Communion, appeared in 1742, under the care of Joseph Clarke, M.A.; and a complete edition of Archdeacon Waterland's works, with a Life of the author, by the late Bishop Van Mildert, was published at Oxford, in 11 vols. 8vo, in 1823.

WATERLOO, ANTONI, a celebrated Dutch landscape-painter, etcher, and engraver, was born near Utrecht about 1618. His landscapes are much prized, on account of their colouring, their skies, and their foliage. His etchings are also excellent: their subjects are taken chiefly from the vicinity of Utrecht, consisting of cottage scenes, crooked roads, woods, and entrances into forests, &c. He could not draw the figures: those in his pictures were painted by Wesenix and others; in his etchings he inserted them very sparingly. There are many bad impressions of Waterloo's etchings, owing to the rough mode of execution. He etched the whole design of an equal strength, but slightly, and then finished in a bold manner with the graver those parts which he desired to be most effective. As the plates therefore were worked off, the etching grew perceptibly fainter, which that part which was executed with the graver suffered comparatively no diminution of effect. Good impressions are much sought by collectors. Bartsch has enumerated 134 of Waterloo's etchings, all of which he has named and described.

Although Waterloo was well paid for his works, and inherited some property from his parents, he died in 1662, at the hospital of St. Job, near Utrecht. He is accounted by some the most masterly etcher of landscape, and his works have always been much studied by engravers.

WATSON, CHARLES, VICE-ADMIRAL, was born in 1714, and was the son of the Rev. Dr. Watson, Prebendary of Westminster. The loss of his father when he was but nine years of age enabled him to follow the inclination he had already manifested of entering the naval profession. His skill and bravery soon procured him promotion; in February 1738, he was appointed captain of the Garland frigate, and, in 1744, he was transferred to the Dragon of 60 guns, under Admiral Matthews, on the Mediterranean station. In that command his services were required on several important occasions, and were generally attended with success. He was afterwards sent by his admiral to Cadiz, with orders to cruise off that harbour for a certain time, afterwards to proceed to Lisbon, and from thence to England. Though these orders opened to him the prospect of making many rich prizes, he ventured to disobey them on receiving intelligence that the enemy's fleet was preparing for sea at Tonion; and, regardless of his interests, he directed his course to the Hières, in order to join the English fleet. During the course of the war, Captain Watson obtained distinction in the several ships which he commanded; his conduct in the action of the 3rd of May 1747, elicited the admiration even of his enemies, and honourable mention was made of it by the French admiral. In another action, during the same year, in which Sir Edward Hawke commanded in chief, he displayed great intrepidity. On the 12th of May 1748, his services were rewarded by his promotion to the rank of rear-admiral of the blue, and in this capacity he received orders to sail with a small fleet to Cape Breton.

In 1754, he was appointed to the command of the squadron destined to co-operate with the expedition of Colonel Clive [CLIVE, ROBERT, LORD] in the East Indies; and soon after his arrival in that country he received his Majesty's commission appointing him rear-admiral of the red. His first exploit was the reduction of Fort Gerish, February 13, 1756, which was held by a piratical prince, who had for many years annoyed the English trade in the East Indies. In the attack made by Colonel Clive on Chandernagore, a place of great strength, and the chief settlement of the French in Bengal, in conjunction with Admiral Pocock, he commanded the small fleet of only three ships of the line destined to co-operate with the land-forces. The French had prepared to resist him by sinking several large vessels in the river below the fort; but the admiral having found a safe passage by carefully sounding as he approached, directed so severe a fire upon the enemy's defences, that, seconded by Colonel Clive's batteries on the shore, the place capitulated in less than three hours (24th of March 1757). By the capture of this fort a large number of prisoners, one hundred and eighty-three pieces of cannon, and a considerable booty, fell into the hands of the English. With this exploit may be said to end this admiral's short but successful career; on the 16th of August 1757, he fell a victim to that unwholesome climate. His death was severely felt by his companions in arms, by whom he was admired for his skill and bravery, and beloved for his moral qualities and amiable disposition. On the 18th of June 1763, the memory of his services was consecrated by the erection of a monument in Westminster Abbey, at the expense of the East India Company.

WATSON, RICHARD, D.D., was born 4th August 1737, at Heversham, near Kendal, in Westmoreland, where his father, a younger son of a small statesman, or land-owner, had been head master of the grammar-school from 1698: the family, supposed to have come originally from Scotland, had subsisted for at least three or four generations in the parish of Heversham, the father having resigned his office in 1737, although he lived till November 1753. Watson was educated under his successor, who took little pains to give him an accurate grammatical training; and about a year after his father's death, at the age of fourteen and a half, he was admitted a sizar of Trinity College, Cambridge, where he was admitted a sizar, 3rd of November 1754. All he had, besides his exhibition, to carry him through college, was a sum of 300*l.* which his father had left him; but he set bravely to work to make his way to independence by hard reading and a hard living. It is said that at first his sleeves were mottled Westmoreland coat and blue yarn stockings. He offered himself as a candidate for a scholarship, which he obtained on the 2nd of May 1757. In September following, while still only a junior soph, he began to take pupils, and continued to be so employed, first as private tutor, then as assistant college tutor, till, in October 1767, he became one of the head tutors of Trinity College. Meanwhile he had taken his degree of B.A. in January 1759, when he was declared second wrangler (he says himself, he ought to have been first); had been elected a fellow of his college in October 1760; had graduated M.A. at the commencement in 1762; and in November 1764, had been, on the death of Dr. Hadley, unanimously elected by the senate to the professorship of chemistry. This was a strange choice, for at that time Watson knew nothing of chemistry whatever; but he did not disappoint the confidence that was felt by himself and others, in his ardour, application, and quickness of comprehension. With the assistance of an operator, whom he sent for immediately from Paris, and by immuring himself in his laboratory, he acquired such an acquaintance with the new subject as enabled him, in about three months, to read his first course of lectures, which were honoured with a numerous attendance, and proved highly satisfactory. He afterwards delivered other courses, which were equally successful; in 1768 he printed a synopsis of the principles of the science under the title of 'Institutiones Metallurgicæ;' in 1769 he was elected a Fellow of the Royal Society, and during some years after this he contributed many chemical papers to the Philosophical Transactions. In 1771 he published 'An Essay on the subjects of Chemistry, and their General Divisions;' in 1781 he published two vols. 12mo, of 'Chemical Essays;' a third appeared in 1782; and a fourth in 1786 completed the work, which has often been reprinted, and was long very popular. But Watson's first publication, properly so called, was 'An Assize Sermon, preached at Cambridge,' 4to, 1769. About two years after this, in October 1771, he was unanimously elected to the office of regius professor of divinity, although he was at the time neither D.D.

Digitized by Google

nor R.D., and in truth seems by his own account to have known little more of divinity than he did of chemistry seven years before. But such was his good luck, or the reputation he had established for carrying his object, whenever he took one in hand, that no other candidate appeared. The professorship when he got it was worth 230*l.*; but his boasts of having raised it to three times that value. Not that he ever had any pretensions to call himself a learned theologian: on the contrary he was rather vain of being spoken of as the *Professor artes-learnéd*, the self-taught professor, or rather the professor who was indebted for what he knew neither to masters nor books. His constitution was, he says, "ill fitted for celibacy;" so in December 1773 he married the eldest daughter of Edward Wilson, Esq., of Dallam Tower, in Westmoreland; and the next day he went to North Wales to take possession of a sinecure rectory, procured for him from the Bishop of St. Asaph by the Duke of Grafton, which after his return to Cambridge he was enabled (also through means of his grace) to exchange for a prebend in the church of Ely. In 1780 he succeeded Dr. Plumptre as archdeacon of that diocese; the same year he was presented to the rectory of Northwold, in Norfolk; and in the beginning of the year following he received another much more valuable living, the rectory of Knaptoft, in Leicestershire, from the Duke of Rutland, who had been his pupil at the university. He was now therefore tolerably well provided for.

Meanwhile his publications not already noticed had been, in 1772, two 'Letters to the Members of the House of Commons,' under the name of 'A Christian Whig,' in support of the clerical petition for the abolition of the subscription; in 1773, also without his name, 'A Brief State of the Principles of Church Authority;' in 1776, a restoration sermon entitled 'The Principles of the Revolution Vindicated,' which made considerable noise, and, as he conceives, gave great offence at court and in courtly circles, but undoubtedly did him good service with his own party; the same year his well-known 'Apology for Christianity,' in answer to Gibbon; and two or three other sermons and charges. In March 1782 on the appearance of Soame Jenyns's 'Disquisitions on Various Subjects,' the toryism of which annoyed him, he thought it necessary to defend his whig principles in 'An Answer to the Disquisition on Government' in that work.

In July 1782 he was promoted to the bishopric of Llandaff, not exactly, as it would appear, on the application of his friend the Duke of Rutland, but rather by the new prime minister, Lord Shelburne, of his own accord, in the expectation of thereby both gaining an active partisan and gratifying the duke. Watson however proved a very unmanageable bishop. The first thing he did after he found the mitre on his head was to publish, in 1783, 'A Letter to Archbishop Cornwallis on the Church Revenues,' recommending an equalisation of the bishoprics. This he did in spite of all that could be said to make him see that he was doing a thing which would embarrass the government, and at the same time do nothing to forward his object. And so he continued to take his own way, and was very soon allowed to do so without any party or any person seeking either to guide him or stop him. He made some good speeches upon the floor of the House of Lords, but never originated nor even materially assisted in carrying any legislative measure. For the most part, in general politics, he sided with what was called the whig party; but he would not come up to vote for Fox's India Bill in 1783, and he had a theory of his own upon the subject of the treatment of the House of Commons by Pitt which followed. On the occasion of the king's illness in 1788, again, he went with his party in maintaining the right of the Prince of Wales to the regency, for which it was thought at the time that he had a good chance of the bishopric of St. Asaph, then vacant; but his majesty's recovery dissipated that along with many more such flattering visions. However before this Watson had received a considerable accession to his fortune by the death, in 1786, of his friend and former pupil, Mr. Luther, of Osgar, in Essex, who left him in his will an estate which he sold for 20,500*l.* He grumbled on about having sacrificed himself to his principles, and being overlooked and left in poverty; but with his bishopric (the duties of which he had wholly neglected), and his professorship, and his archdeconry, and his rectory—and, by the by, we had managed this matter, either entire, or as nearly as possible, sinecures—in addition to this money and the profits of his various publications, his case could not well be expected to excite much commiseration.

What remains of his biography is little more than the catalogue of his other literary performances. In 1785 he published a useful 'Collection of Theological Tracts selected from various Authors for the Use of the Younger Students in the University,' in 6 vols. 8vo, which went through two large editions. 'An Address to Young Persons after Confirmation,' which he published in 1796, was also extensively sold. In 1790 he published anonymously 'Considerations on the Expediency of revising the Liturgy and Articles of the Church of England, by a consistent Protestant;' another of his adventurous proclamations of peculiar views, which brought upon him a good deal of outcry and obloquy. This was followed, in 1792, by 'A Charge delivered to the Clergy of his Diocese in June 1791,' full of vituperation of the Corporation and Test Acts, and laudation of the French Revolution. Upon this latter subject however he soon after cooled considerably, as appeared by his next publication, a sermon published in 1793, which he entitled 'The Wisdom and Goodness of God in having made both Rich and Poor,' and which was expressly directed against the very democratic principles out of which the Revolution of France had sprung. He talks of the 'strange' turn which that great movement had by this time taken, as justifying or accounting for his apparent change of feeling about it; as if it was the course of events that had been in the wrong—not he and his anticipations. In 1796 appeared another of his best remembered works, his 'Apology for the Bible, in a Series of Letters addressed to Thomas Paine.' This was followed two years after by 'An Address to the People of Great Britain,' an energetic appeal in support of the war against France, which, the more perhaps by reason of the quarter it came from, excited immense attention. Fourteen regular editions of it, he says, were sold, besides many pirated ones. Some years after, in 1803, he published another tract, entitled 'Thoughts on the intended Invasion,' in the same spirit. Various Charges and single Sermons were also printed by him from time to time, which need not be noticed in detail. His last publication was a selection of his fugitive pieces, in two octavo volumes, which appeared in 1815, under the title of 'Miscellaneous Tracts on Religious, Political, and Agricultural Subjects.' The latter years of his life he spent mostly in retirement—far away from his diocese—on his estate of Calgarth Park, in Westmoreland, which he amused himself in ornamenting and improving by building and planting. He died there on the 4th of July 1816. He left several children. After his death appeared, under the superintendence of his son Richard Watson, LL.B., prebendary of Llandaff and Wells, the work from which the above particulars have been principally extracted, entitled 'Anecdotes of the Life of Richard Watson, Bishop of Llandaff, written by himself at different Intervals, and revised in 1814.'

WATSON, ROBERT, a respectable Scotch author of the age of Hume, Robertson, and Adam Smith. Robert Watson was a native of St. Andrews, where his father combined the profession of brewer and apothecary. Robert completed the usual courses of languages and philosophy, and commenced the study of divinity in the University of St. Andrews. He attended the Divinity Hall in Glasgow for at least one winter, and finished his theological studies in Edinburgh. In 1751 Adam Smith having removed to Glasgow, where he had been elected professor of logic, Watson was encouraged by Lord Kames to deliver a course of lectures on rhetoric and belles-lettres, similar to that which had been delivered by Smith. The reception these lectures met with encouraged him to repeat the course every winter during his continuance in Edinburgh. In 1758, having become a licentiate, or, as it is called in Scotland, a "probationer," he entered himself a candidate for one of the churches of his native town, which happened to be vacant. The application was unsuccessful, but Mr. Henry Rymer, professor of logic in St. Salvador's college, entertaining thoughts of retiring from the discharge of duties health, Watson prevailed upon him, by the payment of a sum of money, to resign in his favour. The other professors sanctioned the bargain, and elected Mr. Watson professor of logic, and the Crown soon afterwards constituted him by patent professor of rhetoric and belles-lettres. Watson effected the same innovation in the University of St. Andrews that was effected about the same time in Glasgow by Smith and Reid, in Aberdeen by Beattie, and in Edinburgh by Finlayson. He substituted for a course of lectures on logic, properly so called, a course of lectures on the theory of the human mind, on the exercise of the reasoning faculty, and on literary criticism.

In 1777 Dr. Watson, stimulated by the success of Robertson's 'Charles V.,' published (at London) his history of 'Philip II. of Spain.' The work was favourably received in England, and immediately translated into French, Dutch, and German. This success encouraged the author to commence the history of Philip III., four books of which were completed at the time of his death in 1780. These works are of very little value. Heavy and inelegant in style, and showing no evidence of a comprehensive or philosophic mind, they are worthless even as a collection of materials; Watson having access to the original sources of information. The works of Prescott and others have in fact entirely superseded them even for the general reader. A few years before his death Dr. Watson had been promoted to be principal of the united college of St. Leonard and St. Salvador on the death of Principal Tullidelph. Watson left five daughters by his wife, who is said to have been a woman of great beauty, daughter of Dr. Shaw, professor of divinity in St. Mary's college. The four complete books of the history of Philip III., with two additional, by Dr. William Thompson, were published by that gentleman for the benefit of the author's family.

WATT, JAMES, "who" (to adopt the eloquent language of the inscription placed by Lord Brougham upon his statue in Westminster Abbey), "directing the force of an original genius, early exercised in philosophic research, to the improvement of the steam-engine, enlarged the resources of his country, increased the power of man, and rose to an eminent place among the illustrious followers of science and the real benefactors of the world," was born at Greenock on the 19th of January 1736. His father, also named James, was at once a ship-chandler, a builder, and a merchant, and was for upwards of twenty years town-councillor, treasurer, and bailie of Greenock, where he is celebrated for the zeal and intelligence with which he performed his duties, and encouraged public improvements. He married

Digitized by Google

a lady named Muirheid, who was the mother of James Watt, and of a younger son, John. By his various occupations he obtained an honourable fortune; but in his later years some unsuccessful enterprises rendered it "necessary that both of his sons, at as early an age as possible, should be trained to rely for their future comfort or distinction, and even for their very subsistence, on their own independent exertions." His death took place in 1782, in the eighty-fourth year of his age.

Being, even in infancy, of a very delicate constitution, the early education of James Watt was in a great measure of a domestic character, although he attended for a time the public elementary school at Greenock. His ill health, which often confined him to his chamber, appears to have led him to the cultivation, with unusual assiduity, of his intellectual powers. It is said that when only six years of age he was discovered solving a geometrical problem upon the hearth with a piece of chalk; and other circumstances related of him justify the remark which is said to have been elicited from a friend on the above occasion, that he was "no common child." About 1750, or shortly afterwards, he amused himself by making an electrical machine; and from a curious anecdote related by Arago, it would appear that the grand subject by which he subsequently immortalised himself formed, thus early, matter of contemplation to the young philosopher. The anecdote referred to appears to have been communicated to Arago by a member of Watt's family. It is, in effect, that his aunt, Miss Muirheid, who did not entertain the same opinion as his father of the powers of the boy, upbraided him one evening at the tea-table for what seemed to her to be listless idleness: taking off the lid of the kettle and putting it on again; holding sometimes a cup and sometimes a silver spoon over the steam; watching the rate at which it issued from the spout; and counting the drops of water into which it became condensed. With the increased light imparted by a knowledge of his subsequent career, the boy pondering before the tea-kettle will, perhaps, as observed by his enthusiastic French biographer, be viewed as the great engineer preluding to the discoveries which were to immortalise him; though its supposed connection with the idea of a separate condenser for the steam-engine is merely verbal.

John, a younger brother of James Watt (who was lost at sea in one of his father's vessels, in the year 1772, at the age of twenty-three), having determined to adopt the business of his father, James was left to follow, in the choice of a profession, the bent of his own inclination; but the versatility of his talents rendered the choice somewhat difficult. During his youth his taste for the beauties of nature and love for botany had been developed on the banks of Loch Lomond, while his rambles among the mountain scenery of his native land called forth an attention to mineralogy and geology. Chemistry was a favourite subject when he was confined by ill health to his father's dwelling. The bountiful field of natural philosophy was opened to him by the popular work of 'SGravesande, translated from his 'Physices Mathematics;' and, like many other valetudinarians, he read eagerly works on surgery and medicine. He was found on one occasion conveying into his room for dissection the head of a child who had died of some unknown disease.

But among the occupations of his father was included that of supplying ships with various kinds of nautical apparatus and instruments. In assisting him his son appears to have acquired some useful rudiments of practical mechanics, as well as good habits of commercial diligence. He soon learned also to construct with his own hands several of the articles vended by his father, thus gaining familiarity in working with the different kinds of metal, wood, and other materials. From the aptitude which he displayed in this kind of work, and in accordance with his own deliberate impressions, he earnestly decided that he should proceed to qualify himself for following the trade of a mathematical-instrument maker.

With this object in view, Watt came to Glasgow in June 1754, being then eighteen years of age, and remained under the roof and care of his maternal relations, the Lusks, till the month of May in the following year; but from the details of his early life given by Mr. Muirhead, his most recent and authentic biographer, it is clear that the statement formerly made that he passed an early apprenticeship at Glasgow, is in all respects erroneous, and that the alleged meeting of runeous incidents are at least apocryphal. During his stay, he enjoyed the advantage of being introduced to the notice and acquaintance of several of the most learned professors in the University, through the instrumentality of his mother's kinsman, Professor George Muirhead. He never attended however any course of lectures delivered within the walls, or by the teachers of the college, though he at once gained the favourable notice of Dr. Dick, who was joint professor of Natural Philosophy with his father, and who strongly recommended his proceeding to London to acquire further instruction in the art which he designed to practise than could at that time be gained in Scotland, at the same time furnishing him with a valuable personal introduction to the celebrated telescope-maker, James Short. Accordingly, on the 7th of June 1755, he set out for the great metropolis, in charge of Mr. Marr, the captain of an East Indiaman, about to join his ship, who had married Watt's cousin-german. Through Mr. Marr, he was employed "in cutting letters and figures, &c," in the shop of a watchmaker named Neale, who wished to have some of his work to show, and by the first week of July we find him, through the exertions of Mr. Short, at work on the brass part of Hadley's quadrant, with Mr. John Morgan, a mathematical-instrument maker in Finch-lane, Cornhill. An agreement was soon concluded, with the approbation of his father, by which Mr. Morgan was to give him a year's instruction, for which he was in return to pay twenty guineas and also to give his labour for that period. His application was severe and intense, and his progress rapid and steady, and when June again came round, he announced to his father, with some reasonable pride, that he could now make "a brass sector with a French joint, which is reckoned as nice a piece of turning work as is in the trade." At the close of his engagement he found himself compelled by ill-health to seek his native air, and at the end of August 1756, he took leave of London and of Mr. Morgan; first however making an investment of about twenty guineas in half a hundred additional tools, with "absolute necessary" materials for "a great many more that he knew he must make for himself," together with a copy of "Bion's Construction and Use of Mathematical Instruments," as translated by Edward Stone. The following October found him engaged in opportunity for the employment of his little stock in trade, as well as of his newly-acquired skill, by the arrival from Jamaica of a valuable collection of astronomical instruments formed by Mr. Alexander Macfarlane, and bequeathed by him to the University. Dr. Dick having requested him to help to unpack them, they were found to have suffered by the sea air, upon which, by a University minute, Watt as being "well skilled in what relates to the cleaning and preserving of them," was desired to put them in order, receiving in payment five pounds, which, "in all probability," says Mr. Muirhead, "was the first money he had earned on his own account, since the termination of his apprenticeship." The "Macfarlane Observatory" was afterwards erected for the reception and use of the instruments.

Shortly afterwards Watt endeavoured to establish himself in business in Glasgow, but, owing to his not being a burgess, he met with opposition from the corporation of arts and trades, who considered him an intruder upon their privileges, and refused to allow him to set up his humblest workshop. From this difficulty he was extricated by the interposition of the authorities of the university, which was not under city jurisdiction. The university offered him an asylum within their precincts, where they permitted him to establish a shop; and they also honoured him with the title of their mathematical-instrument maker. These circumstances happened in about the year 1757, when Watt had scarcely attained his twenty-first year; and it appears that he was especially indebted, for the friendship shown by the authorities of the university, to the kind offices of Adam Smith, author of the "Wealth of Nations," Dr. Robert Simson, the eminent mathematician, and also of Dr. Dick. The first branch of his business which became profitable was the manufacture and sale of Hadley's quadrants. As he proceeded in other departments, Watt displayed much ingenuity and unwearied dexterity; and his superior intelligence led to his being first known him only as an expert and amiable artificer, to form habits of intimacy and friendship with him, so that his workshop became a favourite resort for the most eminent scientific men in Glasgow. His intimate friend, Professor Robison [ROBISON, JOHN], then a student ardently pursuing his investigations in mathematical and mechanical philosophy, in a manuscript unpublished when used by Arago, but printed in Mr. Muirhead's recent collection, expresses the surprise which he felt when, on being introduced to Watt, whom he expected to find merely an intelligent workman, he found a philosopher, as young as himself, yet willing and able to instruct him, or any of the students who might fall into difficulties. He needed but prompting to take up and conquer any subject; and Robison states that he learnt the German language in order to peruse Leupold's 'Theatrum Machinarum,' because the solution of the problem on which he was engaged seemed to require it; and that similar reasons led him subsequently to study Italian. Without neglecting his business in the daytime, Watt devoted his nights to various and often profound studies; and the mere difficulty of a subject, provided it was worthy of pursuit, appears to have recommended it to his indefatigable attention. In illustration of this characteristic of his mind, it is related that he undertook and accomplished the building of an organ, although he is said to have been so totally insensible to the charms of music that he could not distinguish one tune from another. His instrument was no less remarkable for its harmony than for several important improvements in its mechanical details; and he is stated to have conquered certain difficulties respecting the theory of temperament in music, a matter then very little understood, and of which he could have gained no knowledge except through the profound but very obscure work published on the subject by Dr. Robert Smith of Cambridge. He also constructed other musical instruments, of several distinct kinds.

The earliest occasion on which the attention of Watt was seriously directed to the properties of the steam appears to have been about 1758, when his friend Robison suggested to him the possibility of propelling wheel-carriages by the agency of steam, and Watt commenced a model of a contrivance for the purpose, but various difficulties intervened, and both Watts and Robison having other matters which required their immediate attention, the scheme was abandoned. He states however, that about 1761 or 1762 he tried some experiments on the force of steam in the apparatus known as Papin's digester; and constructed and worked a small model, consisting of an inverted syringe, the bottom of the rod of which was loaded with a weight alternately admitting the steam below the piston and letting it off into the

Digitized by Google

atmosphere. Thus he practically demonstrated the power of steam used as in modern high-pressure engines, but he soon abandoned these experiments, and appears to have entertained a prejudice against the use of high-pressure steam throughout his subsequent career. He however described this engine in his specification of 1769, and again in that of 1784, together with a mode of applying it to the moving of wheel-carriages. The event to which the commencement of his invaluable discoveries may be most distinctly assigned, took place in the winter of 1763-4, when Professor John Anderson, who occupied the chair of natural philosophy in the University of Glasgow, requested him to examine and repair a small model of Newcomen's steam-engine, which could never be made to work satisfactorily. His sagacity led him to discover and remove the defects of this model, which was subsequently used in the class-room: and by this circumstance he was led to detect the imperfections of the machine itself, and to investigate those properties of steam upon which its action depended. About this time he left the college and took up his abode in the town previous to his marriage with his cousin, Miss Miller, in the summer of 1764.

The effective working of Newcomen's machine depended upon two apparently irreconcilable conditions: first, that when the cylinder was full of steam, a degree of coldness should be produced within it that should occasion the sudden condensation of the steam, and thereby produce a partial vacuum beneath the piston, which should cause the atmospheric pressure on the upper surface to force it down with sufficient rapidity to give motion to machinery for working a pump; and, secondly, that immediately after the completion of one stroke the temperature of the cylinder should be again raised to such a degree as to enable it to become refilled with steam preparatory to another stroke. A considerable quantity of steam was lost between each stroke in effecting the second object; and when it was accomplished, as the cylinder was too hot to allow the immediate condensation of the steam just admitted, time was lost in cooling it again. Watt calculated that the amount of heat lost from this radical defect of the old, or, as it is usually called, the "atmospheric" steam-engine, was three times as much as was applied to the efficient action of the machine.

Such was the best, perhaps it is not too much to say the only efficient steam-engine used before the time of Watt; and notwithstanding its wasteful expenditure of fuel, it was extensively used for the purpose of draining mines. It was thus applied in the collieries in the north of England, in the tin- and copper-mines of Cornwall, and in the lead-mines of Cumberland. Shortly after the middle of the 18th century it was applied to the purpose of raising water to turn water-wheels, and it was used also for the working of blast-furnaces in smelting iron-ore, and in a few cases for raising water for the supply of towns; but its use was necessarily limited by the enormous cost of working, as well by its defective and clumsy construction. Watt perceived that it was desirable, in order to the efficient use of the steam, that the cylinder should always be as hot as the vapour which entered it, to provide for which he had recourse to the beautifully simple expedient of condensing the steam in a separate vessel, which might always be kept cool, and between which and the cylinder a communication might be opened whenever the piston was required to descend. This arrangement being effected, he next devised means for deriving the fullest possible advantage from it, by maintaining a uniform and high temperature in the cylinder; an object which he accomplished by enclosing its upper end with a cap or cover, through which the piston-rod could slide freely up and down by means of the air-tight aperture called a stuffing-box, and by employing the elastic force of steam, instead of the pressure of the atmosphere, to depress the piston whenever a partial vacuum was formed beneath it by condensation. The uniform warmth of the cylinder was further promoted by surrounding it with a hot case or outer casing, and filling the intervening space between its inner and outer walls with steam. The invention was in its main feature completed as early as 1765; and in the course of his early experiments Watt was much struck by the great heat communicated to the injection-water by which the condensation was effected by a very small quantity of steam, a circumstance which led him by further trials to the discovery that water converted into steam would heat about six times its own weight of water at 47° or 48° to 212°. Being struck with, and not understanding, this remarkable fact, as he says in himself states in the notes to Robison's 'Mechanical Philosophy,' Watt mentioned it to his friend Dr. Black, who then explained to him his doctrine of latent heat, which he had taught some time previously, although Watt states that he had either not heard of it, or not attended to it when he thus, to use his own words, "stumbled upon one of the material facts by which that beautiful theory is supported." In order to correct an erroneous statement which may have obtained wider circulation than its refutation, we insert a further quotation from the above notes, where Watt observes—"Dr. Robison qualifies me as the pupil and intimate friend of Dr. Black, and goes the length of supposing me to have professed to owe my improvements upon the steam-engine to the instruction and information I had received from him, which certainly was a misapprehension. He is also mistaken in his assertion that I had attended two courses of the Doctor's lectures. Unfortunately for me, the necessary avocations of my business prevented me from attending his or any other lectures at college."

The marriage of Watt released him from the difficulty which had compelled him to establish himself in the precincts of the college, his wife being the daughter of a freeman. Being thus rendered a freeman himself, he opened a shop in the Salt-market, where his increasing business led him to require the labours of an assistant. The success of the first experiments induced Watt to determine upon the construction of a larger model than could be conveniently and privately constructed at his usual place of business, and therefore he set up this machine, with the assistance of his ingenious apprentice, John Gardiner, in one of the rooms of a pottery or 'delft-work,' which he had assisted in establishing near Glasgow, and in which he held a share. An accident terminated his experiments with this engine, which had a cylinder of nine inches diameter, and which, as far as it was worked, proved satisfactorily the practical importance of his improvements; and as neither his leisure nor his means enabled him to proceed, the project was for a time laid aside.

In addition to his employment as a mathematical-instrument maker, Watt devoted much time to the practice of land-surveying, and this led to the employment of his superior talents in the more important departments of civil engineering. Such engagements appear to have occupied much of his attention between the year 1765, when the leading features of his invention were perfected, and 1768, when he found in Dr. John Roebuck, to whom he had become known as a surveyor, an individual capable of appreciating the value of his improvements, and sufficiently enterprising to support him in further experiments. Dr. Roebuck, who is perhaps best known as the founder of the Carron iron-works and the vitriol-works at Prestonpans, was at this time engaged in an extensive colliery undertaking at Kinneil, a few miles from Carron; and in an outbuilding connected with his residence Watt commenced, in the winter of 1768, a third model, on a much larger scale than either of the preceding. This engine had a cylinder of block tin, eight-ten inches in diameter; and in its construction many difficulties had to be overcome, arising partly from inexperience as to the proportions of the several parts, but mainly from the imperfect workmanship unfortunately then characteristic of the art of machine-making. One great difficulty consisted in the steam-tight packing of the piston, which could not be effected, as in the old engines, by covering it with a body of water. At length, after eight months' labour, Watt and Roebuck had the satisfaction of seeing the machine in successful operation. The saving of fuel was enormous; the saving effected in the supply of water for condensation was little less important, and the result of the experiment fully satisfied Roebuck, who obtained a share in the patent by which Watt secured his discoveries. This patent had been applied for in 1768, before the engagement with Roebuck, and it was obtained on the 5th of January 1769. The objects embraced in this were as follow:—Excluding atmosphere from cylinder—keeping cylinder as hot as the steam—condensation produced in separate vessels—air extracted from condenser by pumps—piston propelled by steam—a steam-engine (or rotary engine)—partial condensation of steam—using oil and wax, instead of water.

In the summer of that year however the mining speculations of Roebuck involved him in such embarrassments that he was compelled to abandon the experiments with Watt's engine, and Watt was therefore obliged to return to his former avocations as an engineer and surveyor (by having relinquished the business of instrument-making in 1768), and to such engagements he chiefly devoted himself until the close of the year 1772. During the surveys and engineering works in which Watt was engaged before he finally devoted himself to the carrying out of his improvements on the steam-engine was a projected canal between the Forth and the Clyde, by what was called the Lomond passage, in which he was engaged in 1767, when Smeaton was engaged on similar surveys for a rival line. He also planned and superintended the execution of a canal for conveying the produce of the Monkland collieries to Glasgow. He was engaged upon the Crinan canal, which was subsequently completed by Rennie; and the deepening of the river Clyde, improving the navigation of the Forth and Devon, and the Water of Leven; a road from Marbrumah Bay to Campbeltown; another from the Grand Canal to the harbour of Borrowstownness; improvements in the harbours of Ayr, Port Glasgow and Greenock; and the building of bridges at Hamilton and Rutherglen, are among the engineering works and projects with which he was connected. Business of this description crowded upon him, and it is stated in the 'Encyclopædia Britannica' that his reports are remarkable for their perspicuity and accuracy. In his surveys he used an improved micrometer, and also a machine for drawing in perspective, both of which he had himself invented. It was while engaged on the greatest engineering work undertaken by him, the surveying and estimating a line of canal between Fort William and Inverness, since executed by Telford on a larger scale than was then proposed, under the name of the Caledonian Canal, that Watt, in the latter part of the year 1773, received intelligence of the death of his first wife; and he soon afterwards determined to follow the advice of his friend Dr. William Small, of Birmingham, to accept an invitation from Matthew Boulton, the founder of Soho, to settle in England.

Boulton, to whom Dr. Roebuck transferred his share in the property of Watt's invention, was a man eminently qualified to bring it into profitable operation; his energetic and business-like habits

Digitized by Google

supplying what was wanting in the character of Watt to cope with and eventually to conquer those moral obstacles which, far more than any mechanical difficulties, rendered the introduction of the improved steam-engine an arduous undertaking. He also possessed in his works at Soho mechanical facilities of a superior order, as well as a large capital to establish the manufacture of steam-engines. Watt's connection with Boulton commenced early in 1774, and they remained in partnership until 1800, when Watt retired from business; but their friendship continued undiminished until Boulton's death, after which Watt expressed, in his notes upon Robison's account of the steam-engine, his high esteem for his former partner, in the passage quoted under BOULTON, vol. i. col. 859. By the latter end of 1774, Watt completed at Soho, with all the facilities afforded by the expert artisans under Boulton's command, his first model engine, which was also exhibited to a deputation from the Cornish miners, and to other persons competent to judge of its performances, which were deemed highly satisfactory. Perfect however as was the action of the improved machine, the patentees knew that much remained to be done to bring it into extensive operation; that costly machinery must be constructed to assist in the fabrication of the new engines; and that a protracted struggle with ignorance and prejudice was to be anticipated before any remunerative return could be expected. As five years out of the term of fourteen years for which the patent was granted had already elapsed, it did not appear probable that the remainder of the term would suffice for the reimbursement of past and prospective expenses; while there was no doubt that the preliminary difficulties once fairly conquered, an active competition in the construction of the improved engines would immediately follow the termination of the exclusive privilege held by Watt and his partner. They therefore immediately applied to parliament for an extension of the term of their patent; and, although the application was met by a violent opposition, in which Edmund Burke took part, "not," as observed by Muirhead, "in any hostility to Mr. Watt or his patent, but from a sincere sense of duty in defending what he conceived, or what were represented to him to be, the claims of a constituent," and which occasioned great expense and anxiety to the patentees, it was ultimately successful, an act being passed, in 1775 (15 Geo. III. c. 61), "vesting in James Watt, engineer, his executors, administrators, and assigns, the sole use and property of certain steam-engines, commonly called fire-engines, of his invention, described in the said act, throughout his majesty's dominions," for a period of twenty-five years from the passing of the act. Being thus secured a return for their outlay, the patentees prepared for the manufacture of steam-engines upon the most extensive scale, and with a degree of accuracy never before applied in the production of large machinery. In order fully to comprehend the difficulties encountered by Watt, it must be remembered that his machine required much more accurate workmanship than those which it was to supersede, and that, as stated by Mr. Boulton, the son of his partner, at the meeting held at Freemasons' Hall in 1824, for erecting a monument to Watt, "at the period of the construction of the first steam-engine upon his principles at Soho, the intelligent and judicious Smeaton, who had been invited to satisfy himself of the superior performance of the engine by his own experiments upon it, and had been convinced of its great superiority over Newcomen's, doubted the practicability of getting the different parts executed with the requisite precision; and augured, from the extreme difficulty of attaining this desideratum, that this powerful machine, in its improved form, would never be generally introduced." Stuart states that when the engine tried at Kinneil was made, there were but one or two artists who could give the requisite degree of workmanship to the boring cylinders of two inches diameter; while Watt required similar accuracy in cylinders of many thousand times their capacity, and in the large pistons, piston-rods, and other working parts of his machine.

The opposition raised to an extension of the patent had the effect of exciting the public attention, and the consequential fact of this fact greatly facilitated the introduction of the machine to general use. Pursuing throughout an enlightened and liberal policy, the patentees invited the public to an inspection of the engine, freely explained the principles of its action, and promulgated a series of experiments under the inspection of practical and scientific mechanics whose professional character and position in society placed their testimony beyond suspicion. Similar experiments were made, before the same persons, on an engine of Newcomen's construction, of the best make and in perfect order; and the results as to quantity of coal consumed, and amount of work done in a given time, were contrasted. Thus the immense saving effected was rendered manifest to the parties to whom the use of the machine was recommended, and the remuneration of the patentees was made proportional to the saving. Without attempting to realise their profit as manufacturers of the engines, Messrs. Boulton and Watt claimed only, by way of rent, the value of one-third part of the coals saved by using their improved machine instead of the old fire-engine. After paying this very moderate claim, it cost little more than half the money previously paid to perform a given amount of work, to say nothing of the great saving of room, water, and repairs. Not only were the engines supplied at certain fixed prices, according to size, at such a rate as would have been charged by any neutral manufacturer, but where persons were either unable or unwilling to throw aside the expensive apparatus which they might have already in operation, the patentees took the old engines in part payment for the new, often at rates far beyond their real value; while in other cases they erected machinery worth thousands of pounds on condition of being paid when they produced the estimated advantage. In some instances parts of the old machinery were brought into use, as, for instance, by placing a smaller working-cylinder within the old one, and using it as the outer case or jacket; when, although the new cylinder was seldom more than half the size of the old one, the power of the machine was so augmented as to present a striking illustration of the value of the patented improvements. Still further to facilitate the adoption of the new machinery by rendering the terms upon which its use was allowed as clear as well as liberal as possible, the patentees laid down a standard of horse-power by which to calculate the power of their engines; and in so doing they honourable spirit was rendered strikingly manifest, since, instead of taking a low standard of horse-power, which would have increased the apparent value of their engines, they estimated the power of a horse as equal to raising 33,000 lbs. one foot high in a day; while Smeaton had valued the force of a strong English horse as low as 22,000 lbs.; and they moreover calculated their machinery so as to perform work equal to raising 44,000 lbs. a foot high for every nominal horse-power; so that, in fact, what they called a five-horse-power engine would perform as much as ten horses according to Smeaton's estimate. Even these liberal terms and modes of computing the power of their machines might have proved objectionable if saddled with the necessity for frequent inspection on the part of the patentees or their agents; and therefore, at once to avoid all vexatious interference for the purpose of ascertaining the amount of work really done, and to afford to all parties a satisfactory check upon every species of fraud by which the engines might be represented as doing more or less than they really did perform, Watt contrived an apparatus for counting and registering the strokes of the great lever or beam of the engine, and thereby affording unerring and indisputable data for computing the power exerted. This apparatus, or 'counter,' was locked up in a box with two keys, one of which was kept by the proprietor of the engine, and the other by the patentees, who employed a confidential agent to open and examine the apparatus, in the presence of the proprietor, every three months.

Of the spirited manner in which Boulton conducted the mercantile department of the great adventure some idea may be formed from the fact, that upwards of 47,000*l.* was spent before the patentees began to receive any return; but at length their remuneration began to pour in, and in no inconsiderable quantity at first, and other mining districts, especially where coal was not abundant, the new engines speedily replaced the old; and although in many cases the patentees agreed to receive a fixed sum, lower than the amount that would have been payable to them under the usual agreement, in lieu of the stipulated rent, they soon realised a very large annual revenue. In one instance, at the Chacewater mine, in Cornwall, where three very large engines were employed, the proprietors agreed to pay 800*l.* per annum for each engine as a compromise for the patentee's share of the saving of fuel.

The chief application of the old atmospheric engine, and also of Watt's first improvement upon it, was for the purpose of pumping water from mines, a purpose for which the circumstance of its power being applied only during the downward stroke of the piston was of little consequence. As however the extension of manufacturing operations called for the introduction of some powerful and manageable prime-mover, more uniform in its action and less dependent upon local circumstances than either wind or water, various attempts were made to apply the steam-engine to this purpose, for which, in most cases, it was necessary to convert its alternating rectilinear motion into a continuous circular arc. Prior to the time of Watt, the principal means adopted for accomplishing this object, which however was very seldom attempted, was to employ the engine in pumping water to take an elevated reservoir, in its descent from which it might turn a water-wheel. A large atmospheric engine was erected for this purpose, in 1752, at Champion's copper and brass works near Bristol; and such engines were subsequently introduced at several other places, among which was the Soho works. Watt was fully aware of the importance of some more convenient method of obtaining rotatory motion from the steam-engine: and of the numerous plans which had either been tried by others or were suggested by his own fertile imagination, he appears to have considered none equal to the common crank, the efficiency of which was shown by its use in the lathe, the knife-grinder's wheel, and other machines in common use long before its application to the steam-engine was thought of. A difficulty however presented itself in the application of the crank to the single-acting engine, or that which exerted power in the down-stroke only, because it would have been necessary to use a very heavily-loaded fly-wheel to keep up and equalise the motion imparted by the separate impulses of the piston, to avoid which Watt once proposed to employ two engines, working distinct cranks on the same axle. Watt however was not the man to publish his inventions until he had brought them to a considerable state of perfection; and consequently in this, as in some other cases, parties who were anxiously watching to obtain, by the most unscrupulous means, a share in the advantages of his ingenuity, were enabled to steal a march upon him. While his attention was directed to other important points, patents were ob-

Digitized by Google

tained, in or about the years 1779 and 1780, by persons named Wasbrough and Pickard, for obtaining rotatory motion from a steam-engine, the plan proposed by Pickard being the simple crank and fly-wheel. Since it appears probable that the idea was obtained through a workman employed by Watt, it is likely that this patent might have been overturned; but as Watt did not think fit to contest it, he used, during the continuance of his patent, his own beautiful contrivance known as the sun-and-planet wheel. It has however been stated, in the 'Encyclopædia Britannica,' that Watt did actually use the crank, in defiance of Pickard's patent, whenever it suited his purpose, and that he was never molested for so doing. Few points in the history of machinery are more curious than the number of plans existed on this subject, and the complicated contrivances proposed for doing that which is so simply and efficiently done by the crank; and many well-informed persons, among whom was Smeaton, doubted the possibility of obtaining a perfect circular motion, like that produced by the efflux of water in turning a water-wheel, from the reciprocating lever of a steam-engine. Perhaps no improvement could be named of equal importance in rendering the steam-engine available as a prime-mover of machinery, as that by which the action of the steam was enabled, by a new arrangement of valves, to impel the piston upwards as well as downwards, thereby doing away with the necessity for balance-weights or any similar contrivance; an arrangement which Watt described and explained by a drawing during his application to parliament for an extension of his patent, although he did not actually patent it until 1782, prior to which time he is said to have privately constructed one or more engines on this, which is known as the double-acting principle. The adoption of this construction involved several other important changes in the machine, among which was the exquisitely beautiful arrangement called the parallel motion, from the working of which Watt himself stated that he derived all the pleasure of novelty which he could have experienced in examining the invention of another. Our space however will not admit of any detail of the improvements introduced under the successive patents of 1781, 1782, 1784, and 1785, although so many of them exist at the present time, notwithstanding all the light thrown upon the subject by succeeding engineers, we are perhaps not in a position fully to realise the advantages of one of his beautiful inventions, that of working steam expansively, or cutting off the access of steam when the piston has performed but a part of its stroke, and leaving it to be impelled through the remainder of its course by the expansive force of the steam already admitted. He is said to have tried this mode of working at Soho as early as 1776, although it was not made public till two years after that time. Suffice it to say, in concluding this brief sketch of the series of improvements by which Watt raised the steam-engine to its present state of efficiency, that, as expressed by Lord Jeffrey in the eulogium originally published in the 'Scotsman' newspaper a few days after his death, so to all that is admirable in the structure of the machine, or vast in its utility, Watt should rather be described as its inventor than as its improver. "It was by his inventions," observes the writer alluded to, "that its action was so regulated as to make it capable being applied to the finest and most delicate manufactures, and its power so increased as to set weight and solidity at defiance. By his admirable contrivances it has become a thing stupendous alike for its force and its flexibility, for the prodigious power which it can exert, and the ease and precision and ductility with which it can be varied, distributed, and applied. The trunk of an elephant that can pick up a pin or rend an oak is as nothing to it. It can engrave a seal, and crush masses of obdurate metal like wax before it,—draw out, without breaking, a thread as fine as gossamer; and lift a ship of war like a bauble in the air. It can human and muslin and force anchors, cut steel into ribands, and impel loaded vessels against the fury of the winds and waves." Nor, while we admire the ingenuity and power of the stupendous machine, should we forget that its contrivance involved very much beyond the range of a mere practical mechanic, however great. With the generosity of a kindred spirit, the late Sir Humphry Davy observed, at a meeting for erecting the Watt monument, that Watt "was equally distinguished as a natural philosopher and a chemist," and that "his inventions demonstrate his profound knowledge of those sciences, and that peculiar characteristic of genius, the union of them for practical application;" and showed that, in the prosecution of his great object, Watt "had to investigate the cause of the cold produced by evaporation, of the heat occasioned by the condensation of steam—to determine the source of the air appearing with water was elated rapidly" an account of the power; the ratio of the volume of steam to its generating water, and the law by which the elasticity of steam increased with the temperature: labour, time, numerous and difficult experiments, were required for the ultimate results; the principle was obvious, but even the application of it to produce the movement of machinery demanded a new species of intellectual and experimental labour. He engaged in this with all the ardour that success inspires, and was obliged to bring all the mechanical powers into play, and all the resources of his own fertile mind into exertion; he had to convert rectilineal into rotatory motion, and to invent parallel motion. After years of intense labour, he obtained what he wished for; and at last, by the regulating centrifugal force of the governor, placed the machine entirely under the power of the mechanic, and gave perfection to a series of combinations unrivalled for the genius and sagacity displayed in their invention, and for the new power they have given to civilised man."

It is painful to turn from the record of the meeting at which Davy thus joined with others among the most eminent men of his time in doing honour to the memory of the great engineer, to the narration of the disgraceful measures by which, not many years before, it was attempted to deprive him of his well-earned emoluments. Even among the Cornish miners, who were deriving the greatest advantages from his machinery, and would in many cases have been compelled to abandon their works but for its giant aid, there were men who grudged to pay him the stipulated third part of their savings, and who took advantage of the pretences afforded by piratical infringers of his patent, to declare their engagements at an end. Thus compelled to call in the law in defence of their rights, Messrs. Boulton and Watt became involved in a most tedious, annoying, and vexatious series of processes, during which they were generously and powerfully assisted, according to Arago, by Colonel (afterwards General) Roy, Mylne, the engineer of Blackfriars Bridge, Herschel, Delue, Ramsden, Robison, Murdoch, Rennie, Cumming, the author of a celebrated treatise on watch and clock-work, More, secretary of the Society of Arts, and Smithern, all of whom gave evidence in their favour. Defeated on the ground of want of originality, the opponents of Watt organised a fresh attack upon the patent, upon the pretence that the written specification of 1769 by Watt in 1769 was imperfect. In order to comprehend at once the injustice and the plausibility of this plea, it should be considered that the specification was necessarily written with only the experience derived from the erection of the rude model at Kinneil, and also that Watt never pretended to be the inventor of the steam-engine, but simply of certain improvements in it, which improvements were of so clear and distinct a character as to be unaffected by any change in the forms, proportions, or positions of the various members of which a complete steam-engine is composed. It was thus of unnecessary as it was impossible that the specification of 1769 should contain a complete description of the machine as made by Boulton and Watt twenty years afterwards. The principal distinguishing features of the engines of Watt were the separate condenser and the closed cylinder; and these being retained in all his machines, gave to them a virtual monopoly in various subsequent improvements which were rather additions to than modifications of his original design, but which were too intimately connected with the essential features of his engines to be separated from them. Yet, as observed by Robert, "After a series of experiments, in which he had been engaged for twenty years, to develope his ideas, the splendid results of his genius and perseverance—the perfect machine—was raised up in judgment against him, to prove that between the years 1790 and 1800 the engines which were sent from Soho were more perfect than could be fabricated from the description he gave of the one he erected in 1769!" At length, after a series of trials extending from 1792 to 1799, a unanimous and clear decision was given, fully vindicating and establishing the rights of the patentees. On this last occasion, Erskine, who acted as counsel for the patentees, delivered a speech which was afterwards published in the form of a pamphlet, and in which he at once keenly satirised and overthrew the argument insisted on by the opposite party, that Watt had invented nothing but ideas; saying whether it could be seriously contended that his inventions, which during the space of nearly thirty years had been admired in all Europe as the greatest practical advance ever made in the arts, was a mere abstract discovery in science; and observing that were those who thus pleaded to approach the untangible substance as they were pleased to call it, with the same ignorance of its nature as they thus affected, they would be crushed before it like flies, leaving no trace of their existence.

In 1794 the sons of Messrs. Boulton and Watt were admitted to the partnership, and on the expiration of the extended term of his patent in 1800, Watt resigned his share of the business to his two sons, and retired into private life; a step to which he was probably determined in some degree by the harassing nature of the contests in which he had been so long engaged. Down to that period the introduction of the steam-engine into other than mining districts had been comparatively slow; and it is stated that at the expiration of the patent the aggregate power of the engines employed in London was not more than 650 nominal horse-powers, in Manchester about 450 horse-powers, and in Leeds about 300 horse-powers. Within the next five years the number of engines used in the metropolis was doubled, and more machines were supplied from the Soho works than during any equal period before the expiration of the patent.

As there were several scientific men residing about Birmingham who were on terms of intimacy with Watt and his partner, an association was formed under the title of the 'Lunar Society,' the members of which, including Priestley, Darwin, Edgeworth, Keir, and Galton, met monthly on the night of the full moon for the purpose of social converse. At one of these meetings, according to Arago, a suggestion was thrown out which led Watt to the invention of the useful little machine known as the Copying Press, for which he obtained a patent, the specification of which was published some years afterwards in the first volume of the 'Repertory of Arts.' It is however stated in the 'Encyclopædia Britannica' that he was induced to contrive it by the

Digitized by Google

necessity of his preserving copies of his drawings and letters, which often contained important calculations, and the desire of avoiding that labour himself which he did not like to entrust to an amanuensis. Among his other useful inventions was a method of heating rooms by steam, which he introduced in his own house in the winter of 1784-85; and he also communicated to Berthollet an account of a 'Steam-Drying Machine,' contrived by him in 1781 for Mr. Macgrigor, of which a description is given under the above title in the 'Edinburgh Encyclopædia.' Towards the latter end of 1786, on a visit to Paris, undertaken at the instance of the French government for the purpose of suggesting improvements on the Machine de Marly, by which the town, palace, and waterworks of Versailles were supplied with water from the Seine, Watt became acquainted with Berthollet, whose method of bleaching with chlorine he brought to this country, and introduced, with certain improvements of his own, in the bleach-works of his friend Mr. Macgrigor, near Glasgow, whose daughter he had married in 1775, not long after his removal to Birmingham. He offered to Berthollet a share in the undertaking, which, from the great superiority of the new over the old process, bid fair to be highly profitable, but this the French chemist declined. Another circumstance indicative of the universality of Watt's talents is his connection with the establishment of the Pneumatic Institution at Clifton, where the medical properties of the gases then recently discovered were made available on an extensive scale, mainly under the direction of Dr. Beddoes. The eldest of Watt's daughter, and delicacy of his younger son, Gregory, led him particularly to devote his attention to this subject, and he designed and constructed the apparatus required for procuring and administering the gases, and wrote the second part of a pamphlet, of which the first part was by Beddoes, entitled 'Considerations on the Medicinal Use of Factitious Airs, and on the manner of obtaining them in large quantities.' This was published at Bristol in 1795; and about the same time appeared two or three editions of a 'Description of a Pneumatic Apparatus, with directions for procuring the Factitious Airs,' by Watt.

Since the original publication of this article in the 'Penny Cyclopædia,' great prominence in scientific literature and in the history of chemistry has been given to the respective claims of Watt, Cavendish, and Lavoisier, as discoverers of the composition of water, by several considerable publications; one relating exclusively to that subject, while it forms the most important part of another, and is discussed at some length in a third. The first of these works is entitled 'Correspondence of the late James Watt on his Discovery of the Theory of the Composition of Water. With a Letter from his Son. Edited, with Introductory Remarks and an Appendix, by James Patrick Muirhead, Esq., F.R.S.E., Lond. and Edin., 1846. Pp. cxxvii., 264. The author of this work, it is remarked by the author of that we shall next advert to, "is the most zealous of Watt's defenders, and the most unhesitating of Cavendish's assailants," with regard to their relative claims as to the discovery of the composition of water.

In the life of Cavendish by Dr. George Wilson of Edinburgh, issued by the Cavendish Society in 1851, and reduced in the former article, [CAVENDISH, HENRY], the third chapter, occupying 103 closely-printed pages, is devoted to the "Controversy between Cavendish, Watt, and Lavoisier, concerning the discovery" in question; and, subsequently, 191 pages are allotted to "a critical inquiry into the claims of the alleged authors" of that discovery. It must here be remarked that everything that had already been said on the subject was before Dr. Wilson, and that the strenuous advocates of Watt, as well as of Cavendish, had placed in his hands all the materials they possessed in support of their claims, or considered to him their most matured sentiments. He states that the late Lord Jeffrey's article in the 'Edinburgh Review' for 1848, is by much the ablest defence of Watt that has appeared, while he considers the Rev. W. Vernon Harcourt (in his address to the British Association at Birmingham in 1839) as the ablest of Cavendish's defenders. The third chapter of the work terminates with the following summary of the results at which he has himself arrived: ". . . the conclusion regarding intellectual merit to which I have come is, that Watt did not signify by phlogiston, hydrogen, and did not assert in the equivalent terms of his own day that water consists of hydrogen and oxygen; and further, that the conclusion to which he came, such as it was, was arrived at later in time than Cavendish's just conclusion, and was drawn from a repetition of his experiments. For Cavendish I claim that he was the first who observed and inferred that water consists of hydrogen and oxygen; and to Lavoisier I assign the merit of having simplified and perfected Cavendish's conclusion, and of having been the first to prove the composition of water by analysis. I acknowledge Watt to have been an independent and original theorist on the composition of water, and to have largely contributed to the dissemination of the true theory of its nature."

To this final conclusion of Dr. Wilson, Mr. Muirhead, in another work, the title of which is subjoined to this article, published three years afterwards, and in which he makes some additions to the statements of his previous separate publication, opposes only the following remarks: Dr. Wilson has "the fairness to admit that the date of Cavendish drawing his inference as to the elements of water cannot with certainty or precision be fixed at an earlier period than the summer of 1783 (Mr. Watt having, we may remind the reader, made his known in April of that year); that he himself believes that Cavendish's views on the subject 'altered and expanded from 1781 onwards to 1784' (when they were first published); and that, at all events, there can be no doubt that Mr. Watt's theory increased the faith of Cavendish and Lavoisier in their own views, and won the approval of the great majority of their scientific contemporaries," &c., &c. Professor James D. Forbes, of Edinburgh, who appears to be the only writer that has entered upon the subject since the publication of both Mr. Muirhead's works and also of Dr. Wilson's, thus expresses his opinion, in his Dissertation on the Progress of Mathematical and Physical Science: "Watt, in after life, may be said to have tacitly relinquished to Cavendish the honour which, in the first irritation of the conflict of their claims, he showed no disposition to do; it is therefore reasonable to infer that, on reflection, he saw good reasons for doing so. By this I mean that he suffered judgment to be passed in favour of Cavendish's claim in the writings of many of his eminent contemporaries, without attempting publicly to correct the all but universal impression which they made. In one instance he almost homologated this adverse judgment. In the article on Steam, written by Robison, and revised by Watt in his last years and after Cavendish's death, this passage appears: 'This is fully evinced by the great discovery of Mr. Cavendish of the composition of water;' from which it must be concluded, first, that Robison, the intimate friend of Watt, and the almost single defender of his fame, believed Cavendish to be the true discoverer; secondly, that Watt, in commenting on this article in 1814, permitted the fact to be thus transmitted to posterity. For, in his numerous animadversions on other parts of these same papers, he gave free expression to the sensitiveness which he felt lest Dr. Black should derive any credit to which he was not entitled in connection with the steam-engine; but he suffers the passage just quoted to pass without remark. Such being the case, and waiving all purely chemical discussion, I am of opinion that Watt's friends should have left the matter as he was content to leave it."

A new translation has appeared of Arago's 'Eloge,' with notes by the translator, in the 'Biographies of Distinguished Scientific Men,' by him, translated by Admiral Smyth, the Rev. B. Powell, and M. R. Grant. As this, we believe, is the most recent publication relative to Watt (1857), it is right to say that it adds nothing to the Water question, and that the translator appears not to have been aware of Dr. Wilson's labours.

The reader will now be enabled either to form a provisional but not unsound opinion on this interesting topic, or to make himself acquainted with its minute history, and the arguments adduced on all sides, by perusing the works referred to; and in this respect the present article may be regarded as supplementary to that on CAVENDISH and LAVOISIER, ANTOINE-LAURENT, in preceding volumes.

After retiring from business, Watt was with difficulty drawn into any undertaking, although on several occasions his advice was sought respecting engineering works. In 1809 the fertility of his inventive powers was shown by a beautiful solution of a difficult problem laid before him by a water-company at Glasgow, who, after establishing their works upon one side of the river Clyde, discovered that water of a very superior quality might be procured from a kind of natural filter on the other side, if they could overcome the difficulty of laying a main from their pumps across the bed of the river. Watt contrived for this purpose a flexible iron pipe, the pieces of which were connected by a kind of ball-and-socket joint, of which he took the idea from the tail of a lobster. The main was constructed from his designs in the following year, with the most complete success; and it has, to be about a thousand feet long and two feet in diameter, capable of bending and applying itself to the irregular bed of the river. In another case, late in life, Watt was prevailed upon, by the solicitation of the Lords Commissioners of the Admiralty, to attend a deputation from the Navy Board, and to give, with Captain Huddart and Mr. Jessop, an opinion upon works then being carried on in Sheerness dockyard, and upon other projected works designed by Messrs. Rennie and Whidby; and on this occasion he received the thanks of the Admiralty for his services. In 1813 or 1814 he yielded to the wishes of his friends, of Brewster especially, by revising the articles 'Steam' and 'Steam-Engine,' contributed by Robison to the 'Encyclopædia Britannica,' and enriching them with valuable notes, which were published with the collected edition of Robison's articles, which appeared under the title of 'A System of Mechanical Philosophy.' The last project to which Watt devoted his attention, and which he appears to have very nearly perfected when he died, was a machine for copying sculpture, with which he had proceeded so far as to execute several specimens, which he presented to his friends as the early attempts of a young artist entering his eighty-third year. Having suffered so much, in other cases, from communicating his ideas to others, he kept the construction of this machine strictly secret; but when he had proceeded sufficiently with his design to contemplate obtaining a patent, he found that another person in his neighbourhood, who appears to have been entirely unacquainted with Watt's project, was engaged upon a similar plan. A proposal was subsequently made for obtaining a joint patent, but Watt was unwilling, at so advanced a period of life, to embark in such an undertaking.

About the year 1790 Watt had purchased an estate called Heath-

Digitized by Google

field, near Soho, where he resided to the end of his life; and he had also a property on the banks of the Wye, in Wales. His health improved in his latter years, and his intellectual faculties remained unimpaired to the last. It is related that, when upwards of seventy, he imagined them to be on the decline, and accordingly determined to put them to the test by undertaking some new study. Having selected the Anglo-Saxon language for this experiment, he mastered it with a facility which proved that there was little ground for his fears. At length however, in the spring of 1819, alarming symptoms began to appear, and on the 25th of August in that year he died, in his eighty-third year,—his last illness having been one, observes his son, rather of debility than of pain. Respecting the members of his family, Arago states that the invariable mildness and cheerful disposition of his first wife rescued him from the depressing lassitude and nervousness from which he had suffered so severely; and that, without her cheering influence, he might never have published his inventions to the world. She died in childbed, September 24, 1773, leaving her surviving children James, the son frequently referred to in this article, and noticed more fully below, and a daughter, who married Mr. Miller of Glasgow. By his second wife, who died in 1832, he had two children, neither of whom survived him. One of these, Gregory Watt, also noticed in a separate article, distinguished himself by his geological investigations, but died in 1804, at the early age of twenty-seven. As might be expected, this bereavement affected Watt very keenly; but Muirhead states that his remarkable activity of mind was unimpaired, nor was his interest in the pleasures of literature and society destroyed, by this melancholy event; and that neither his conversation nor his correspondence betrayed any approach to the remarkable silence which Arago states to have been observed in the latter years of Watt.

Of the private character of the great engineer a most pleasing account is given by Lord Jeffrey, who, after stating that, independently of his great attainments in mechanics, he was an extraordinary, and, in many respects, a wonderful man, observes, "Perhaps no individual in his age possessed so much and such varied and exact information,—he had read so much, or remembered what he had read so accurately and well. He had infinite quickness of apprehension, a prodigious memory, and a certain rectifying and methodising power of understanding, which extracted something precious out of all that was presented to it. His stores of miscellaneous knowledge were immense, —and yet less astonishing than the command he had at all times over them. It seemed as if every subject that was casually started in conversation with him, had been that which he had been last occupied in studying and exhausting, such was the promptness, the fulness, and the admirable clearness of the information which he poured out upon it without effort or hesitation." In social conversation he allowed his mind, like a great cyclopedia, to be opened upon whatever subject might best suit the taste of his associates; and he made every thing so plain, clear, and intelligible, that, it is remarked, scarcely any one could be conscious of any deficiency in their own capacity in his presence. With all this flow of information, his conversation, we are further informed, "had no resemblance to lecturing or solemn discoursing, but, on the contrary, was full of colloquial spirit and pleasantry." Of a generous and affectionate disposition, he was considerate of the feelings of all around him, and gave the most liberal assistance and encouragement to all young persons who showed indications of talent, or who applied to him for patronage or advice. As his death approached, he was perfectly conscious of his situation, and calm in the contemplation of it, expressing his thankfulness for the length of days with which he had been blessed, for exemption from most of the infirmities of age, for the calm and cheerful evening of life which he had been permitted to enjoy after the honourable labours of the day had been concluded.

In acknowledgment of his invaluable services to his country, it was intimated to Watt a few years before his death, by a friendly message from Sir Joseph Banks, that, to use the words of Muirhead, "that highest honour usually conferred in England on men of literature and science was open to him, if he expressed a wish to that effect;" but while he felt flattered by the intimation, he determined, after advising with his son, to decline it. He became a member of the Royal Society of Edinburgh in 1784, of that of London in the following year, of the Batavian Society in 1787, and in 1808 a correspondent of the French Institute; and in 1814 the 'Académie des Sciences' of the Institute conferred upon him the highest honour it can bestow, by electing him one of its eight foreign associates. In 1806, by a unanimous vote, the University of Glasgow conferred upon him the honorary degree of LL.D. In 1824 a subscription was entered into for erecting a statue to his memory in Westminster Abbey, and a public meeting, of which the late Charles Hampden Turner, Esq. F.R.S., the attached and zealous friend of Watt and his family, was chairman, was held at the Freemasons' Tavern to do honour to the man who had taught us to wield, as it was then observed, the mightiest instrument ever entrusted to the hands of men, and whose inventions were characterised by Davy as among the great means which had enabled Britain to display power and resources, during a long war, so infinitely above what might have been expected from the numerical strength of her population. A large sum was immediately raised, and Chantrey was engaged to furnish the statue, which is one of the finest of his works, and which calls to mind the remark of Watt's friend, Mr. Richard Sharp, who said that he never looked at his countenance without fancying that he beheld the personification of abstract thought. To this an appropriate inscription by Lord Brougham was added. Another statue by Chantrey adorns an elegant chapel erected by his son, at the parish church of Handsworth, near Birmingham, in the chancel of which he was interred. Other statues have been erected in St. George's Square, Glasgow; in the University of Glasgow, where the memory of Watt is also preserved by an annual prize which he founded for the best essay upon some subject connected with science or the arts; in a public library at Greenock, which is enriched with a collection of scientific works presented by Watt during his life, and to which his son contributed liberally; and in the open space in front of the Infirmary at Manchester a bronze copy of Chantrey's seated statue of Watt has been placed on a pedestal so as to correspond with a similar statue of John Dalton.

In 1834 M. Arago read to the French Académie des Sciences the 'Historical Eloge' to which allusion has been repeatedly made in this article, and which reflects much honour on the liberal feeling of the author. It has been more than once translated into English; but the translation we have chiefly referred to is that of Watt's relative, James Patrick Muirhead, Esq., M.A., published in 4to, in 1839, to which some valuable notes are added; the new translation (1857) has already been mentioned. Of other authorities referred to for the purpose of this memoir, the notices of Watt in the 'Encyclopædia Britannica;' Brewster's 'Edinburgh Encyclopædia;' and the 'Public Characters of 1802-3,' together with the printed 'Proceedings' of the public meeting above referred to, are among the principal.

The following is a bibliographical notice of Mr. Muirhead's third and most important work on the subject of this article, which, we believe, is also the most recent separate publication relating to him or his achievements:—'The Origin and Progress of the Mechanical Inventions of James Watt, illustrated by his Correspondence with his Friends and the specifications of his patents. By James Patrick Muirhead, Esq., M.A. In three volumes,' 8vo, London, 1854. Vol. i: Introductory memoir and extracts from correspondence, pp. xviii, cclxxxiii, and 104; with a portrait of Watt, from Sir F. Chantrey's bust, and 31 woodcuts in fac-simile of Watt's drawings of his inventions in the constructions of instruments, machinery, and apparatus. Vol. ii.: Extracts from correspondence, pp. xxxiv, and 374; with an engraving of Pidgeon's medal of Matthew Boulton, and 27 fac-simile woodcuts. Vol. iii.: Letters patent, specifications of patents, and appendix of documents relating to Savery and Papin, and to the legal proceedings in which Boulton and Watt were engaged for the protection of their patents, pp. xiv, and 292; with an engraving of the reverse of the medal of Boulton, 34 plates of machinery, and 2 woodcuts. Mr. Muirhead's Life of Watt, 1858, merely repeats his previous statements.

Professor James D. Forbes, in his 'Dissertation on the Progress of Mathematical and Physical Science,' principally from 1775 to 1850, published in November 1856, in the eighth edition of the 'Encyclopædia Britannica,' devotes a section of his fourth chapter to Watt, under the following heads:—"Condition of the practical mechanics previous to the time of Watt.—His genius for the application of science to practice.—His successive improvements on the steam-engine. —Steam navigation." Mr. Forbes's remarks on the Composition-of-Water question, already cited, will be found in section 2 of the sixth chapter.

JAMES WATT, the eldest son of the preceding, was born on 5th of February 1769, and died, unmarried, at his seat, Aston Hall in Warwickshire, near Birmingham, on the 2nd of June 1848. His succession to the manufactory and fortune of his father has already been stated or indicated in the preceding article.

Mr. Watt had early directed his son's attention to natural philosophy and chemistry, and he had also applied himself to the practical study of mineralogy. It is scarcely known, and has not been recorded in any previous biographical work, that he was the first to point out, in his twentieth year only, one of the secretaries of the Literary and Philosophical Society of Manchester, then just founded, one of the earliest, and perhaps still the most distinguished of the provincial scientific associations. It was in 1787 that the locality was communicated two papers in 1789, one on the mine (at Anglezark, near Chorley, in Lancashire) "in which the aerated [carbonate of] barytes is found," and the other "on the effects produced by different combinations of the Terra Ponderosa [barytes] given to animals." Though it was not, as has been said, the actual discoverer of the carbonate of barytes at Anglezark, he was the first to describe, in the paper here alluded to, the circumstances under which it occurred, and to make known the fact that the specimens examined and the amplies of the mineral from which was prepared the muriate, which had been formerly introduced into medical use by Dr. Adair Crawford, F.R.S., had been obtained from that locality. His also were some of the earliest experiments on the poisonous effects of the combinations of barytes.

A remarkable episode now occurred in the life of the young philosopher—for such, at this period, we may call him. Mr. Watt had directed his son's attention to the study of science on the Continent; and—accompanied, as it would appear, by his friend Thomas Cooper, one of the vice-presidents of the Manchester Society, and who afterwards became professor of chemistry in Columbia College, in America —he proceeded to Paris. But here, carried away by the enthusiasm

Digitized by Google

then prevalent in what was termed the cause of liberty, he sympathised with the Girondists and Jacobins, and even took some open and avowed part in their earlier tumultuous agitations, in company with Cooper, and subsequently with Wordsworth the poet also. Southey has recorded, from the information of James Watt himself, that so highly was he at first regarded by the French leaders, that he was the means of preventing a duel between Danton and Robespierre. A more public exhibition of zeal in the cause he had espoused, in which Cooper also took part, was afterwards deeounced by Burke in the House of Commons. The licence and excesses of the revolutionary parties ho never opened the eyes of the young enthusiast to the real nature of the principles he was supporting, and ho then endeavoured to mitigate as far as possible the violence which he foresaw he must in future deplore. This became eventually the cause of his quitting Paris and abandoning his French associates and their objects; for Robespierre, at the club of the Jacobins, insinuating that Cooper and his compatriot were amisaries of Pitt, the British primo minister, James Watt indignantly silenced his formidable antagonist from the tribune in a brief but impassioned harangue, delivered in excellant French, carrying with him the feelings of the rest of the audience. On returning home he learned that his life was no longer safe for a day, instantly left Paris, sacrificing all his property in making his way to the south, and did not rest until he arrived in Italy.

Not long afterwards he returned to England, and in 1794, as already intimated, began to be actively engaged as a partner in the management and direction of the steam-engine manufactory at Soho, which necessarily withdrew him from political pursuits and political law suits, strictly so called, and what he effected in the latter has almost escaped notice.

Mr. James Watt took a part in the progress of steam-navigation, especially as regarded the requisite adaptations in the construction of the engines, not unworthy of his name and of the reputation of the firm of which he became the leading partner. Mr. Henry Bell of Glasgow, who had in 1811 taken the enterprising step of himself trying, in Scotland, at his own risk and under his sole direction, an experiment similar to that which, in the hands of Fulton (whom he had aided), had succeeded so well in America, built several steam-vessels propelled by engines of his own construction. Among these was the Caledonia, of 102 tons and 32 horse-power, which was launched in 1815, but from defects in her engines had been little used. In April 1817 she was purchased by Mr. James Watt, who had her machinery taken out and replaced by two new engines of Soho manufacture, of 14 horse-power each. In October he went over in her to Holland, and ascended the Ithine as far as Coblenz; having thus been the first to leave the British shores and enter the channel by so novel and, as it was then esteemed, so hazardous a mode of transit. On her homeward voyage she entered the Scheldt and visited Antwerp, and was then laid up for part of the winter in the harbour of Rotterdam for repairs and alterations. "After her return to the Thames in the spring of 1818," it is stated by Mr. Muirhead, to whose Memoir we are indebted for these particulars of the history of steam-navigation in this country, "Mr. James Watt made no fewer than thirty-one series of experiments with her on the measure (the whole number of those experiments amounting to 250), which resulted in the adoption of many most material improvements in the construction and adaptation of marine engines, and in an immense though gradual extension of that branch of the manufacture at Soho." The marine engines manufactured there down to the year 1854, "were in number 319, of 17,438 *nominal* or 52,314 *real* horse-power."

Some further particulars of Mr. James Watt may be gleaned from the two later publications of Mr. Muirhead. He wrote, in 1823, the memoir of his father in Macvey Napier's Supplement to the 'Encyclopædia Britannica' (subsequently transferred, in substance, to the seventh edition of that work); and in 1846 he addressed a letter to Mr. Muirhead on his father's claims as to the composition of water, which is prefixed to the "Correspondence' of the latter on that subject. The publication of his father's specifications of patents and documents relating to them was originally designed and to a considerable extent prepared by him; but, from the infirmities of age, confided prior to his decease to Mr. Muirhead, by whom it has been accomplished in the work already cited and described.

GREGORY WATT, son of JAMES WATT by his second wife, Anne, daughter of Mr. Macgrigor of Glasgow, was born in 1777. The moral and intellectual culture which a child of singular natural powers would receive from such parents may readily be conceived, and an early, though by no means premature development of them was the result; the promise of boyhood became that of youth, to be realised in manhood. In 1794, when only seventeen years of age, he became a partner in the house of Boulton and Watt, at the same time with his elder brother and Mr. Robinson Boulton. But this did not interfere with the progress of his education, a portion of which he received at Glasgow, quitting that University however in the year 1797, enriched beyond his age with both science and literature, and still devoted to the acquisition of knowledge, but in a declining state of health. He was now recommended by his physician to reside for some time in the West of England, and he accordingly proceeded, in the winter of that year, to Penzance, where he became a lodger in the house of Mrs. Davy, a widow, the mother of Humphry, afterwards Sir Humphry Davy. The history of the friendship which eventually united these gifted man is remarkable. Davy, according to Dr. Paris, sought to ingratiate himself with his mother's lodger, by addressing him familiarly on subjects of metaphysics and poetry, but Watt coldly repelled his advances. "It was by mere accident," says Dr. Paris, "that an allusion was first made to chemistry, when Davy flippantly observed, that he would undertake to demolish the French theory in half an hour; he had touched the chord,—the interest of Mr. Watt was excited,—he conversed with Davy upon his chemical pursuits, he was at once astonished and delighted at his sagacity—the barrier of ice was removed," and an intimacy of the warmest and most disinterested nature grew up between them, which continued to the very moment of Mr. Watt's premature dissolution. The initiation of this friendship with Gregory Watt was one of the circumstances which favoured the rapid advance of Davy in chemical philosophy. In familiar intercourse with the family of the latter, they met daily; they explored the objects worthy of notice in the adjacent country, visited the most remarkable mines, and collected specimens of rocks and minerals. Mr. Watt continued to reside at Penzance through the spring season of 1793. It was through his new friend that Davy transmitted to Dr. Beddoes an account of his experimental researches on heat and light, the impression made by which on the mind of the latter was one of the train of circumstances resulting in the appointment of Davy as chemical superintendent of the Pneumatic Institution at Bristol, itself an important step to his further advancement. This circumstance perhaps led to the error in the articles, BEDDOES, THOMAS (vol. i. col. 410) of stating that Davy was recommended to Beddoes for the superintendence of the Pneumatic Institution by Gregory Watt, whereas the recommendation was really made by Davies Gilbert. The early delicacy of Gregory Watt's health, and that of his sister, who predeceased him, and the nature of their disease, consumption, had led their father to devote much attention to the medical properties of the gases, and induced him to assist Dr. Beddoes in the foundation of the Pneumatic Institution, by producing the requisite apparatus for the evolution and respiration of the gases.

In the year 1800, Mr. Watt finally retired from business, resigning his shares in the manufactory at Soho to his two sons, nuder whom and their young partner it continued to prosper. But as Mr. Muirhead has stated, Gregory, by the kindness of his elder brother James, was relieved from the details of business, for which he had little inclination, and "enabled to devote his attention to those higher pursuits of science and literature in which he found delight," while still retaining his share in the profits of the steam-engine manufactory. Gregory Watt, from the summer of 1801 to the autumn of the following year travelled or resided on the Continent, hence he returned much delighted with his tour, but still in bad health.

The literary recreations however, and especially the philosophical researches, which he had commenced at a very early age, and which, it would appear, had never been altogether intermitted, were now resumed with vigour; and in April 1804, he addressed to the Right Hon. Charles Greville, V.P.R.S., the celebrated experimental paper,—at once the foundation, the establishment, and unhappily the sole record of his scientific greatness—entitled 'Observations on Basalt, and on the Transition from the vitreous to the stony State, which occurs in the gradual Refrigeration of melted Basalt; with some geological Remarks;' read before the Royal Society on the 10th of May, exactly a month after the day of its date, and published in the 'Philosophical Transactions' for 1804, part ii., of which it occupies twenty-six pages. The author states, that having been induced to repeat the experiments of Sir James Hall, on the regulated cooling of melted Basalt, it had afterwards occurred to him that something might be learned, by exposing to the action of heat, a much larger mass of basaltic matter than had been on one time been subjected to experiment. The researches and inductions detailed in this paper, it has been remarked, constitute the foundation of nearly all that has hitherto been made known on the subjects to which it relates. The elucidation it affords of the geological history and mode of formation of the spheroidal and columnar rocks has not yet been superseded, or become the common property of science. Of it and of its author, his early friend, Davy, in a lecture on the phenomena and causes of volcanos, delivered at the Royal Institution, in a course on Geology, in 1811, thus expresses himself: "Mr. Gregory Watt fused some [seven] hundred-weight of basalt; and suffering it to cool in a mass, examined the results by breaking it into pieces. The largest crystals were found in the interior, where the congelation must have been comparatively slow. His paper on this subject . . . abounds in acute observations and sagacious inferences. It was the first and only production of a mind full of talent and enthusiasm for scientific pur-uits—of a mind which promised much for the philosophy of this subject; but death cut off the bloom and promise of this hope for the scientific world, at the moment when it was brightest. No person attached to truth can read this paper without a feeling of regret; and I hope I may be excused for the strong expression of this regret—for whilst I admired him as a philosopher, I loved him as a man. He was the earliest and one of the dearest of my scientific friends."

It is just to the memory of Mr. Gregory Watt, and may be important to future inquirers into the process of formation of the igneous rocks, to notice here a conclusion founded upon his results in the investigation,

to which in fact they are opposed, but to which it must in fairness be admitted his own inferences have led. He did not himself recognise the full force of the experimental facts he had obtained, with respect to the reproduction of the stony texture by the gradual cooling of the melted basalt, and subsequent geologists in general have committed the cardinal error of interpreting them as proving that the stony substance which the fused matter thus became, was identical with the original rock; an error which has involved the chemico-geological history of the trap-rocks and the lavas in an obscurity hitherto impenetrable; and which has also introduced an unreal difficulty in the consideration of Mr. Poulett Scrope's discovery of the true nature of the fluidity of those lavas which are in fact aggregate rocks. Sir H. Davy, it is true, in the lecture cited above, and referring apparently to the same style; but the pupil soon surpassed the master in his own style, and this was so evident even to Gillot himself, that he forsook painting and took to engraving. Watteau now acquired reputation rapidly: he was appointed peintre des fêtes galantes du Roi, and was elected a member of the French Academy of Painting. In 1718 he came to England, where he remained a year; but he painted only two pictures during his stay, for Dr. Meade, whom he came to consult, says Walpole. He returned to Paris in a very weak state of health, and died at Nogent-sur-Marne, near Paris, July 18, 1721.

Watteau's colouring was rich, and his design, though peculiar, was correct; Rubens was his model for colouring. His pictures are chiefly theatrical scenes, or fêtes champêtres, and were remarkably popular in their own time; nearly all the French engravers of his period were occupied with the works of Watteau. The prints after his works amount to 563, making three large folio volumes. Few painters in so short a life have done so much as Watteau. As regards the particular style which he created, Watteau is generally believed to have had an injurious effect upon the taste of the French artists of his time; his pictures generally represent balls, masquerades, garden parties, marches, and encampments, and his style prevailed in France for some time after his death. His principal imitators were Peter and Lancret. His style is not ill described by Walpole, who says, "The genius of Watteau resembled that of his countryman D'Urfé; the one drew and the other wrote of imaginary nymphs and swains, and described a kind of impossible pastoral or rural life led by those opposites of rural simplicity, people of fashion and rank. Watteau's shepherdesses, nay, his very sheep are coquet; yet he avoided the glare and clinquant of his countrymen; and though he fell short of the dignified grace of the Italians, there is an easy air in his figures, and that more familiar species of the grace fil which we call genteel. His nymphs are as much above the forbidden mark, as their goddesses, as they are above the hoyden awkwardness of country girls. In his halts and marches of armies, the careless slouch of his soldiers still retain the air of a nation that aspires to be agreeable as well as victorious."

WATTS, ALARIC ALEXANDER, was born in London on March 16, 1799, and was educated at the grammar-school called Wye College, in Kent, of which one of his brothers was master. He was subsequently removed to another school at Ashford, and then acted as teacher in the school of his brother at Putney. He next became the literary assistant of G. Crabbe, the author of the 'Technological Dictionary,' and afterwards tutor in a private family at Manchester. In 1822 he published a small volume of poems—containing several pieces of genuine poetical merit—which was favourably received by the public and by critics, but of which few editions have been published. In this volume he also displayed that taste for the fine arts which has distinguished many of his subsequent publications, as it was embellished with engravings by Heath after designs by Stothard. In the latter part of the same year he became editor of the 'Leeds Intelligencer' newspaper, in which he strenuously advocated an amelioration of the factory system. His recommendations however were not popular among the manufacturers, and, after editing the paper for three years, he removed to Manchester, where he edited the 'Manchester Courier.' During his residence in Leeds a proposal had been made to him to the editorship of an annual, in which literature and the fine arts were both to be prominent objects. He agreed, and 'The Literary Souvenir, a Cabinet of Poetry and Romance,' was commenced. It was continued from 1825 to 1835, and at first was highly popular, as it deserved to be from the style of literature and of art by which it was introduced into it. The contributors to the literature were himself, Campbell, Wordsworth, Southey, Coleridge, Montgomery, and others; among the artists who furnished the designs were Turner, Leslie, Stothard, Roberts, Lawrence, Collins, Danby, and Martin, and among the engravers were Heath, Finden, Goodall, Watt, and Pye. But the public favour declined, and after 1836 it ceased to appear. In 1825 he left the 'Mancheester Courier,' and in 1828 published the 'Poetical Album, or Register of Modern Fugitive Poetry.' It was intended to be an annual, but only lived for two years. In 1827 he was engaged on the 'Standard' London evening newspaper, and in 1833 he started the 'United Service Gazette.' In 1843 disputes with his partners led to a Chancery suit, and to the paper being sold: it is still continued as a valuable class paper. From 1841 to 1847 he was again engaged on the 'Standard,' but since then has ceased to have any connection with the newspaper press. In 1851 he published an edition of his select poetical writings under the title of 'Lyrics of the Heart, with other Poems,' some of them being by his wife, illustrated by

(See SEPTIMIUS.)

WATT, ROBERT, M.D., is the author of a well-known work, entitled 'Bibliotheca Britannica, or a General Index to British and Foreign Literature,' Glasgow, 4 vols. 4to, 1819-1820; Edinburgh, 1824. The account given of him in the 'Dict. of Living Authors' (at the time of his death) is that he was born in Ayrshire in 1774, that he died at Glasgow March 12th, 1819, that he was president of the Faculty of Physicians and Surgeons of Glasgow, and lecturer on the theory and practice of medicine, and that he had published the following works during his lifetime:—'Cases of Diabetes, Consumption, &c.,' Paisley, 8vo, 1808; 'Catalogue of Medical Books,' Glasgow, 8vo, 1812; 'Treatise on the History, Nature, and Treatment of Chincough,' Glasgow, 8vo, 1813; 'Rules of Life, with Reflections on the Manners and Dispositions of Mankind,' Edinb., 12mo, 1813 (anonymous); besides a few papers in the 'Transactions' of the Medico-Chirurgical and one or two other societies.

The 'Bibliotheca Britannica' is in two parts: the first containing an alphabetical arrangement of authors, with the published works of each in chronological order; the second, a similar arrangement of subjects, with an enumeration of the books treating of them, and references to the entry of each work under the author's name in the first part. The compilation, prepared amid the calls of a professional life and without access to any extensive library, and carried through the press without having the advantage of the author's revision, is no doubt chargeable with many positive errors, as well as with important deficiencies; but it is notwithstanding both a remarkable performance for an individual and an aid of very considerable utility in many literary investigations. It cannot be relied upon as an authority, but it is serviceable as a guide or indicator.

WATTEAU, ANTOINE, a celebrated French painter, was born at Valenciennes in 1684. He went to Paris in 1702, with a scene-painter, with whom he had placed himself, and for some time was occupied in that branch of painting. But after some time his master left Paris, and Watteau was obliged to seek another employer: he for a short time found occupation as a copyist, and painted pictures by the dozen. From this employment however he was rescued by Claude Gillot, a painter of some ability, who having perceived the peculiar genius of Watteau, took him into his house and employed him to assist him in his works. Gillot painted landscapes with grotesque figures, fauns, satyrs, in a very weak style, and confirmed Watteau in the same style; but the pupil soon surpassed the master in his own style, and this was so evident

forty highly finished engravings. Except some occasional short poems, this is his last publication. In 1853 a pension of 100*l.* a year was conferred on him by the Queen.

'MRS. ZILLAH WATTS, the wife of the preceding, and sister of J. H. Wiffen, the translator of Tasso, is also distinguished for her literary talents. From 1829 to 1836 she edited 'The New Year's Gift and Juvenile Souvanir,' which partook of the character of that edited by her husband. In 1839 she published 'The Juvenile Poetical Library.' In 1845 she furnished the letter-press to Finden's 'Tableaux of National Character, Beauty, and Costume;' in 1849, that to 'Hogarth's Tableaux, a series of original graphic Scenes, with Illustrations in Poetry and Prose;' and in 1856, 'The Birth Day Council, or How to be Useful.'

WATTS, ISAAC, the eldest of nine children, was born at Southampton July 17, 1674. His father, who kept a boarding-school in that town, was a man of strong devotional feeling and a rigid nonconformist. He was imprisoned on account of his religion, and during his confinement his wife sat on a stone at the prison door, with little Isaac, then an infant, at her breast. The child showed a taste for books at a very early age, and imbibed under parents whose faith had been strengthened by persecution that turn of mind which prompted the determination to become a dissenting minister.

Isaac Watts entered on the study of the learned languages in the free grammar-school of his native town in his fourth year. The little money he received in presents he spent upon books; his leisure hours he spent in reading instead of joining the other boys at play. When only seven or eight years old he composed some devotional verses for, to please his mother. His gentle yet precious disposition obtained him friends, who offered to support him at one of the universities; but having been bred a nonconformist, he determined to remain one. He was therefore sent, in his sixteenth year, to an academy in London, kept by Mr. Thomas Rowe, at that time minister of the Independent meeting-house in Haberdasher's Hall.

During the three years that he remained with Mr. Rowe, Watts pursued his studies with intemperate ardour, allowing himself no time for exercise, and curtailing the period allotted to sleep. He thus irremediably injured his constitution. He used to mark all the books he read, to abridge some of them, and annotate others, which were interleaved for the purpose. Dr. Johnson says of his classical acquirements—'Some Latin essays, supposed to have been written as exercises at his academy, show a degree of knowledge, both in language and theological, such as very few attain by a much longer course of study;' and "in his youth he appears to have paid attention to Latin poetry: his verses to his brother, in the glyconick measure, written when she was nineteen, are remarkably easy and elegant." He also made great proficiency in the study of Hebrew, of logic, and scholastic divinity. His acquirements in mathematical and physical science appear to have been inconsiderable. Before leaving the academy he joined in communion with the congregation of Mr. Rowe, who was accustomed to say that he never had occasion to reprove Watts, and who often held him up as a pattern to his other pupils. Watts returned to his father's house in 1694, and spent the next two years of his life in private study. The greater part of his hymns, and probably most of his juvenile compositions, were composed during this time.

In 1696 he was invited by Sir John Hartopp to reside in his family at Stoke Newington as tutor to his son; he remained there till the beginning of 1702. Lady Hartopp was the daughter of Fleetwood by his first marriage. Sir John, as might be inferred from his forming such a connection, was a zealous nonconformist: when the Act of Uniformity was at its height, the fine upon Stoke Newington, of which he paid the greater part, amounted to six or seven thousand pounds. In this family the religious and political opinions which Watts had imbibed from his parents and schoolmaster were strengthened. The first outline of the work afterwards published under the title of 'Logic' was prepared during this period for the use of his pupil. Isaac Watts preached his first sermon on the day on which he completed his twenty-fourth year—the 17th of July 1698. In that year he was chosen assistant to Dr. Chauncy, pastor of the Independent church then meeting in Mark-lane, but he continued to reside and discharge the duties of teacher in Sir John Hartopp's family till 1702. In that year he was persuaded reluctantly to succeed Dr. Chauncy in the pastoral office. Soon after his entrance upon this charge he was seized with a dangerous illness, which, after a long confinement and a slow recovery, left him with a constitution so evidently impaired that the congregation thought an assistant necessary, and accordingly, in July 1703, appointed Mr. Samuel Price. Watts's health returned gradually, and he performed his duty till 1712, when he was seized by a fever so violent and of such continuance that he never perfectly recovered.

This illness excited the lively sympathy of all his friends. The foremost in kind offices was Sir Thomas Abney, who invited him to try the effect of change of air at his house at Theobalds. Watts accepted his invitation, and went there intending to stay only a single week, but he remained six-and-thirty years—till his death. "In a few years," says Dr. Gibbons, Watts's earliest biographer, "Sir Thomas Abney died; but his amiable consort survives, who shows the Doctor the same respect and friendship as before; and most happily for him, and great numbers besides (for as her riches were great, her generosity and munificence were in full proportion), her thread of life was drawn out to a great age, even beyond that of the Doctor. And thus this excellent man, through her kindness and that of her daughter, Mrs. Elizabeth Abney, who in a like degree honoured and esteemed him, enjoyed all the benefits and felicities he experienced at his first entrance into this family till his days were numbered and finished, and like a shock of corn in his season, he ascended into the regions of perfect and immortal life and joy."

The tenor of the remainder of Watts's life was uniform. Sir Thomas Abney had been bred up in dissenting principles; King William knighted him; and he served the office of Lord Mayor of London in 1700. His first wife was a daughter of Caryl, the first pastor of the Mark-lane congregation; his second, a daughter of Mr. Gunston, an honoured friend of Watts. The house of the Abneys at Theobalds occupied the site of Burleigh's residence. Of the splendid gardens of that palace there remained little more than a long moss-grown walk, overshadowed by two rows of elms, and within a few yards of the entrance of the walk there stood, in Sir Thomas Abney's garden, a summer-house, which, fifty years after Watts's death, was shown as the place in which he had composed many of his works. Watts's usefulness among his flock was in nowise diminished by his residence at Theobalds. There was a carriage at his command when his health permitted him to officiate in London. When he was incapable of public labour, he refused to receive his salary; and at all times a third part of his income was devoted to charitable uses. The seasons when indisposition incapacitated him from public duty were spent in literary composition.

The most important of Watts's publications are:—1, 'Logic;' or, the Right Use of Reason in the Inquiry after Truth: with a variety of Rules to guard against Error in the affairs of Religion and Human Life, as well as in the Sciences,' published in 1725. This treatise, which appears to have been used in Dr. Johnson's time as a text-book at Oxford, was written originally to assist the studies of Watts's pupil, Sir John Hartopp, and was revised, augmented, and published at the request of Mr. Eames. Dr. Johnson remarked of this work—"If he owes part of it to Le Clerc, it must be considered that no man who undertakes merely to methodize and illustrate a system, pretends to be its author." 2, 'The Knowledge of the Heavens and Earth made easy; or, the First Principles of Astronomy and Geography explained by the use of globes and maps, with a solution of the common problems by a plain scale and compasses as well as by the globe: written several years since, for the use of learners;' published in 1726. This is the work of an intelligent amateur; it has of course been long superseded. 3, 'The Improvement of the Mind,' an expansion of some passages in Locke's 'Conduct of the Human Understanding.' 4, 'A number of Discourses for children and youth, viz:—The Art of Reading and Writing English;' 'Prayers composed for the Use and Instruction of Children:' 'Divine Songs attempted in easy language for the Use of Children,' &c. It was from motives of gratitude to Sir Thomas and Lady Abney that he first engaged in this humbler class of compositions. No compositions of the kind have obtained such extensive use as his hymns and songs for children. 5, 'An Essay towards the Encouragement of Charity Schools, particularly those which are supported by the Protestant Dissenters for teaching the Children of the Poor to read and work together with some Apology for those Schools which instruct them to write a plain hand, and fit them for Service or for the meaner Trades and Professions of Life: to which is prefixed an Address to the Supporters of those Schools;' published in 1728. The occasion of this publication was a sermon which Watts had been desired to preach in the November of the preceding year, in support of the dissenters' school. It vindicates the extension of education to the poor; and the establishment of dissenting schools on the ground of the proselyting character communicated to parochial schools by the High Church party. 6, 'A Sermon preached at Berry Street, on the occasion of the Death of our late gracious Sovereign George I., and the Peaceful Succession of his present Majesty George II.;' published in 1727. This is chiefly valuable as an exposition of the religious and political views of the dissenters at that period. The theological works of Watts are too numerous to admit of being recapitulated here. His 'Three Dissertations relating to the Christian Doctrine of the Trinity,' and 'Nine Sermons preached in the years 1715-19,' published in 1812, with a Preface by Dr. Pye Smith, may be taken as fair specimens. The 'Horæ Lyricæ' of Watts, from which an estimate of his poetical talents may be formed, was republished in 1837, with a memoir by Dr. Southey. A poet he can scarcely be called, yet his verse is generally smooth, sometimes nervous; and the matter is always judicious, sometimes touching, sometimes approaching to eloquence.

Watts is a classic of the people. His hymns for children have exercised an influence on the minds of the young far beyond the limits of the dissenting body. His 'Logic' was once a text-book in various places of education. He was in his day one of the most zealous advocates of the principles which placed the house of Hanover on the throne; in his pamphlet in defence of the dissenting charity-schools he was the efficient precursor of those friends of popular instruction who gave, at a later time, their countenance and support to Joseph Lancaster; and his theological writings are prized by almost the whole religious public of Great Britain. Wherever the English language is spoken Isaac Watts will be found to have exercised no slender

Digitized by Google

influence in the formation of public opinion. His writings have contributed much to keep alive the spirit of freedom, toleration, and piety. "It was therefore with great propriety," the opinion is entitled to the greater weight as coming from the high-church Tory, Dr. Johnson, "that, in 1723, he received from Edinburgh and Aberdeen an unsolicited diploma, by which he became a doctor of divinity. Academical honours would have more value if they were always bestowed with equal judgment."

The conduct of some very near relatives embittered his latter days, and for a while he seemed, being at the time in a state of extreme weakness, stupified by it to such a degree as hardly to take notice of anything about him. The worst part of this behaviour was kept from him. "Lady Abney," says a correspondent of Doddridge, "keeps him in peaceful ignorance, and his enemies at a becoming distance; so that in the midst of this cruel persecution he lives comfortably, and when a friend asks him how he does, answers, 'Waiting God's leave to die.'" In this patient and peaceful state of mind, on the 25th of November 1748, and in the seventy-fifth year of his age, he departed. He was buried in Bunhill Fields. Mr. Samuel Chandler delivered a funeral oration at his interment; Lady Abney and Sir John Hartopp erected a handsome tomb over his grave; and the number of funeral sermons preached and published on the occasion, bespeak the deep sense of his merits entertained by the dissenters. The texts of some are strikingly appropriate: that of the Rev. David Jennings was "Well it, being dead, he yet speaketh;" that of the Rev. Caleb Ashworth, "Know ye not that there is a prince and a great man fallen this day in Israel."

(*Memoir of Isaac Watts, D.D.*, by Robert Southey; *Life of Watts*, by Dr. Samuel Johnson; *Sermons on the Death of the late Rev. Isaac Watts, D.D.*, by David Jennings; *Memoirs of the Rev. Isaac Watts, D.D.*, by Thomas Gibbons.)

WEAVER, THOMAS, F.R.S., an eminent geologist, was one of the band of scientific men, who, with the late Professor Jameson, the late Leopold von Buch, and Alexander Humboldt, learned the rudiments of mineralogy and geology under the tuition of Werner at Freiberg, where he commenced his studies in 1790. He was long a distinguished and active member of the Geological Society of London, particularly in its earlier days; and was elected a Fellow of the Royal Society on the 9th of March 1826. From 1795 to 1798, and again in 1801, he was concerned, with the gentlemen mentioned below, in the exploration, on account of the government, of the deposits of gold which had been discovered at Croughan Kinsbella, in the county of Wicklow, in Ireland. An account of the discovery was given by John Lloyd, Esq., F.R.S., and a mineralogical account of the gold itself by Abraham Mills, Esq., both referring to Mr. Weaver, were published in the 'Philosophical Transactions' for 1796. A particular history of the proceedings of himself and his colleagues, in reference to the gold workings, was given by Mr. Weaver in his Memoir on the 'Geological Relation of the East of Ireland,' inserted in the 'Transactions of the Geological Society,' first series, vol. v. His afterwards communicated a paper on the Gold-workings to the 'Philosophical Magazine' for July 1835 (Series 3, vol. vii. p. 1), giving some extracts from the Memoir, with new matter. In the 'Philosophical Transactions' for 1825, is a paper by Mr. Weaver, On the Fossil Elk of Ireland, in which he infers that that animal lived and flourished in the countries in which its remains are now found at a period of time which, in the history of the earth, may be considered as modern. In the Second Series of the 'Trans. Geol. Soc.' vol. i., is an elaborate memoir by him, entitled 'Geological Observations on Part of Gloucestershire and Somersetshire,' and in vol. v. another, 'On the Geological Relations of the South of Ireland.' He communicated other papers, all on geological subjects, to the 'Annals of Philosophy,' Old and New Series, and subsequently to the 'Philosophical Magazine,' in which (Series 3, vol. ix.,) appears a paper on the 'Carboniferous Series of the United States of North America,' a portion of the result of his geological and mining researches in Mexico and the United States in which he was engaged from 1831 to 1834. He died at his residence in Stafford-place, Pimlico, London, on the 2nd of July 1855, having retired from the field of science some years before.

WEBBE, SAMUEL, an eminent composer of that part-music which we may justly claim as national, was born in the year 1740. His father, who held an office under the British government at Minorca, dying suddenly, and leaving his property in such a state that his family never profited by it, his widow was unable to give her son a liberal education, and at the age of eleven he was apprenticed to a cabinet-maker. On the completion of his term however he abandoned a pursuit so little to his taste, and commenced the study of the Latin language. But his mother dying shortly after, he was reduced to the necessity of following the example of J. J. Rousseau, and copied music as a means of subsistence, though knowing but very little of the art. This led to an acquaintance with a German, named Barbandt, organist of the Bavarian chapel, who initiated him in the principles of music. His unwearied industry and patience enabled him not only to support himself by copying, but to acquire, in addition to the Latin, a knowledge of the French and Italian languages. He now began to give lessons in music, and soon after to compose, and was so successful in the latter attempt, that, at the age of twenty-six, he gained a gold prize-medal from the Catch-Club for the best canon. In 1768 he was rewarded by the same society, by a medal for his simple but beautiful glee, 'A generous friendship no cold medium knows,' which immediately established his reputation. From the year which first witnessed his success as a composer, to 1792, Mr. Webbe had twenty seven medals awarded him by the same club, for glees, catches, canons, and odes. But it is worthy of remark, that four of his finest works, including that matchless production, 'When winds breathe soft,' failed in obtaining the golden honours bestowed on works of far inferior merit. And it must be confessed that some of his medals were given him for compositions now forgotten; among which too many were the reward of useless pieces of musical mechanism, called canons.

In 1784 Mr. Webbe was appointed to succeed Mr. Warren Horne, as secretary of the Catch-Club; and in 1787, on the establishment of the Glee-Club, he became a professional member and the librarian. It was for this society he wrote both words and music of his popular glee, 'Glorious Apollo.' But amidst his professional avocations he found time to acquire a considerable knowledge of Greek, and even of Hebrew, and to become conversant in many branches of polite literature. Mr. Webbe's glees, &c. amount to the large number of one hundred and seven. Besides these, he produced masses (being a Romeu Catholic), anthems, single songs, &c., some of which are yet well known, particularly 'The Mansion of Peace,' and 'From glaring show.' He died in 1817, leaving a son (named after his father), a musical amateur and an accomplished man, who inherited some of his parent's musical talent.

WEBER, CARL-MARIA VON, one of the most distinguished of the German school of music, left, among other interesting manuscripts, an autobiography, which has supplied us with much of the substance of the following memoir.

He was born in December 1786, at Eutin in Holstein. His education was liberal, and conducted with the utmost care; and as his father was a musical man, who had acquired a considerable reputation as a violinist, he, almost unconsciously, led his son in pursuit of music particularly, while he encouraged his study of the fine arts generally. His mind was also rendered contemplative by the retired manner in which his family lived, and by the few visitors at his father's house, who were chiefly middle-aged men of various professions and accomplishments. Precautions were taken to keep him from associating with wild playmates; and thus he was early taught to find company in his own thoughts—to live, as he says, in the little world of his own imagination, and to seek therein his occupation and his happiness. His time was principally divided between painting and music. Of the former he was successfully cultivated several branches, working alternately in oil, in water-colours, and in crayons. He likewise acquired some degree of skill in the use of the etching-needle, but he did not follow up these employments with ardour, and they were silently suffered to be discontinued. The impression he made upon his mind before he was conscious of its influence, and at last entirely supplanted her sister art. His father frequently changed his place of residence, and this led to as frequent a change in his son's masters, who too often undid what had been done; an evil however which Weber, in after life, thought more than compensated by compelling him to become his own instructor, and to depend on his own energies. He analysed, compared, and reflected, and sought to deduce well-grounded principles, especially in music, from what he had heard, read, and thought. To Hausseder, of Hildburghausen, he was indebted for his skill as a pianoforte player; and he mentions in warm terms of gratitude the advantage he derived from this master during the years 1796 and 1797.

His father, now observing the great and decided development of his son's musical talents, took him to Salzburg, and placed him under the tuition of Michael Haydn, brother of the illustrious composer, and himself a very learned musician; but though the pupil laboured with earnestness and industry, his progress was not equal to his expectations. The master was at an advanced period of life, was grave, not to say severe, in his manner. There was in fact too awful a distance between old age and childhood. At Salzburg, in 1798, his father, as an encouragement, printed his first production, consisting of six *fughetti*, which was very favourably noticed in the German 'Musical Gazette' of that year. Shortly after this he went to Munich, where he received lessons in singing from Valesi, and in composition from the organist of the chapel-royal, M. Kalcher, to whose kind and luminous instructions, he says, he was indebted for much important knowledge, particularly with respect to the treatment of subjects in four parts, the laws of which, he adds, should be as familiar to the composer as those of syntax and metre to the poet; for it is such knowledge alone that will enable him to present his ideas to his hearers with perspicuity and ease.

He now applied to his study with unabated vigour, and found a preference for dramatic music growing rapidly on him. Under the eye of his master he composed an opera, 'Die Macht der Liebe und des Weins' (The Power of Love and Wine). His also wrote a grand mass, several sonatas and variations for the pianoforte, violin trios, songs, &c., all of which however he candidly tells us were "wisely committed to the flames."

About the same time the art of lithography was first discovered, and the restless activity of the youthful mind, which embraces with eagerness all that is novel, again diverted the young composer's

Digitized by Google

attention from his legitimate pursuit, and excited in him a wish to rival the ingenious inventor of that art. He procured the necessary tools, and setting himself vigorously at work, at length almost fancied himself the original inventor: at least, he says, he felt sure that he had devised a more perfect system, and could construct more perfect machinery. Impressed with this belief, he urged his father to remove to Freiberg, where all the necessary materials could be more readily procured. The mania however quickly left him; the mechanical nature of his new occupation, the fatigue and annoyance attending it, and, above all, its tendency to cramp and deaden the more intellectual faculties, soon determined him to abandon it, and he returned with increased zest to his musical pursuits.

Weber now set to music Steinsberg's opera, 'Das Waldmädchen' (The Wood-girl), which was performed in 1800, and spread further than, at his maturer age, he thought desirable. It was, he says, a crude jejune work, though in some parts not altogether destitute of invention. The whole of the second act was composed in ten days, a youthful affectation of promptness which he honestly acknowledges, condemns, and deplores. Being called to Salzburg, he there, in 1801, composed 'Peter Schmoll.' In 1802 his father proceeded with him on a musical tour to Leipzig, Hamburg, and Holstein, in all which places he diligently collected and studied the theoretical writers of music. He then felt himself impelled towards that great resort of musical talent, Vienna. There, in addition to the society of other eminent masters, including the immortal Haydn, he became acquainted with the Abbé Vogler, who generously opened to him the treasures of his mind. By his advice he laboriously set to work upon a treatise, suggested by the fervour of youthful inexperience, and dedicated nearly two years to the study of the great masters, analysing their compositions, and thus discovering their mode of carrying out their ideas and of employing their means. An invitation to fill the situation of music-director at Breslau offered him a new field for exertion and fresh opportunities of gaining a knowledge of effect. He there re-touched several of his earlier works, and composed the greater portion of the operas of 'Rübezahl,' which, strange to say, afterwards appeared as the composition of Professor Rose. In 1806 that true lover of the art, Prince Eugene of Würtemberg, invited Weber to his court at Carlsruhe, where he produced two symphonies, several concertos, &c.; but the evils of war obliged him to move, and proceed on a professional tour, under very unfavourable circumstances, though common enough at that turbulent period. This brought him to Stuttgard, where he resided for some time in the house of Duke Louis of Würtemberg, and completed his opera of 'Sylvana,' or rather remodelled it on his former work, 'Das Waldmädchen,' producing during the same period several other compositions.

In 1810 Weber set out on another professional journey in Germany, which he traversed in various directions. At Frankfurt, Munich, Berlin, Vienna, and other places his operas were performed, and his concerts well attended. In Vienna he found his venerable friend, the Abbé Vogler, devoting the remnant of his life to the instruction of his pupils Meyerbeer and Ganshacher. At Darmstadt, in 1810, he composed 'Abon Hassan.' From 1813 to 1816 he directed the opera at Prague, after having completely re-organised that establishment. Then he lived for some time unoccupied. Subsequently he accepted an engagement to found a German opera at Dresden, and this appointment, which he held till his decease, absorbed during the first two years, nearly the whole of his attention. In 1822 he brought out, at Berlin, his greatest work, 'Der Freischütz,' the text, or libretto, by his friend and countryman Kind. Not only the novelty and originality of the music, but the deep thought it evinced, immediately excited an extraordinary sensation in the north of Germany; and a copy of the work having been sent to London and obtained by the editor of 'The Harmonicon,' an extract from it appeared, in January 1823, in the first number of that periodical. This gentleman lost no time in mentioning the opera in strong terms to the proprietor of the English Opera-House, who, fearing to incur the expense of getting it up, declined the attempt. From this same quarter it was then recommended to Drury Lane, and afterwards to Covent Garden, but with a similar result. However other specimens of the work, and among them the beautiful cavatina, appearing in the 'Harmonicon,' and public attention having thus been called to it, the opera was at length performed, July 23rd 1824, at the English Opera-House, and produced as great an effect in London as it had done in Berlin. In the following October it was given at Covent Garden theatre, and in November at Drury Lane, with the most brilliant success at both houses. On the 6th of December 'Der Freischütz,' under the title of 'Robin des Bois,' was brought out in Paris, at the Odéon, and though it did not make the same powerful impression on a French as on an English audience, its effect was sufficiently flattering to the composer, who nevertheless had great reason to complain of the surreptitious means by which his music had been procured, and of the imperfect manner in which it had been prepared.

In November 1823, Weber produced at Vienna his 'Euryanthe,' which was not at first received with the enthusiasm his 'Freischütz' had excited. It is perhaps too serious, and certainly not written in a popular manner; but the more it became known, the more it was admired, and the overture is one of the composer's happiest flights of genius.

In 1825 Weber received a visit at Dresden from Mr. C. Kemble, the lessee of Covent Garden theatre, for the purpose of inviting him to compose an opera for the English stage, and to superintend its production in London; an engagement which he willingly undertook. The terms were five hundred pounds. Mr. Planché provided the drama, which was entitled 'Oberon, or the Elf-King's Oath,' and founded on Wieland's celebrated poem. In 1826, on the 12th of April, it was brought out, and though at first some of its beauties were not discovered by those who were unaccustomed to music of an original and high an order, yet they were fully felt by competent judges. The author was greeted in the most cordial manner by the audience, and thoroughly satisfied with his public reception and the success of his work, which had twenty-seven representations, twenty-four of which were conducted by the composer. But it was now apparent that he was suffering under pulmonary disease. His journey to London in an unfavourable season, and his arrival in February, in the worst weather possible, aggravated his malady: nevertheless he bore up manfully against his sufferings. On the 26th of May he had a benefit concert at the Argyll Rooms, which was but badly attended. He was very ill at its commencement, and though he managed to conduct the concert to the end, at its conclusion he was so exhausted as to create considerable alarm in the by-standers. On Monday, the 5th of June, early in the morning, he was found in a lifeless state in his bed. His funeral was delayed a considerable time by the endeavour to obtain permission to deposit his remains in St. Paul's cathedral; but this could not be granted in a Protestant church, as his friends resolved to have a Catholic ceremony, having always openly professed himself a member of the Church of Rome. At length the interment took place, on the 21st of June, in the Roman Catholic Chapel, Moorfields; and the followers, consisting chiefly of distinguished professors and amateurs, were so numerous as to fill sixteen mourning coaches.

Weber was a man who would have stood prominent in any station of life demanding the exertion of quick powerful intellect. His mind, naturally strong and active, was enlarged by education, and highly cultivated by extensive reading and the society of literary and scientific friends. His manners were easy and graceful, and his conversation was remarkable not only for good sense, but for a degree of pleasant sententiousness which closely bordered on wit. His morals were irreproachable, and he well supported, on every occasion, the character of an honourable gentleman. He left a widow and two sons to deplore the untimely loss of an excellent husband and father.

• WEBER, WILHELM EDUARD, was the son of Michael Weber, a distinguished Protestant theologian, and was born at Wittenberg on December 24, 1804. He studied first at the Lower School at Halle, and afterwards entered the university there, of which eminently he became professor extraordinary of natural philosophy. In 1826, in conjunction with his elder brother, Ernst Heinrich, who was professor of anatomy and physiology in the University of Leipzig, he published 'Die Wellenlahre auf Experimente gegründet, oder die Wellen tropfbarer Flüssigkeiten mit Anwendung auf die Schall- und Lichtwellen' (The Wave Theory grounded on Experiments, or the liquid fluidity of Waves, with its application to Waves of Sound and Light). In 1827 he published 'Leges oscillationis oriundæ, si duo corpora diversa celeritate oscillantia ita conjungantur, ut oscillare non possint nisi simul et synchronice.' In 1831 he was appointed professor of physics in the University of Göttingen, from which office he was displaced by Ernest, king of Hannver, on December 14, 1837, on account of his liberal political opinions. In 1836 he had written in conjunction with his younger brother Edward, now professor of medicine at Leipzig, 'Mechanik der menschlichen Schwerkzeuge' (Mechanism of the Human Optical Organs). He then travelled about Germany, and visited England, till 1843, when he was recalled to his post. He had published many essays on magnetism and physics to various German scientific journals. The most important of these was one written in conjunction with Gauss 'On the Magnetism of the Earth,' which opened many original views on this subject, gave a new direction to the investigations, and was recognised by scientific men as a work of great merit. This was followed, in 1840, by the 'Resultate aus den Beobachtungen des magnetischen Vereins' (Results from the Observations of the Magnetic Society), and 'Der Atlas des Erdmagnetismus' (Atlas of the Magnetism of the Earth). One of his latest is the 'Elektrodynamischen Massbestimmungen' (Electrodynamic proportional Measures).

WEBSTER, DANIEL, was born January 18, 1782, in the township of Salisbury, New Hampshire, United States of America. His father, Ebenezer Webster, was descended from Thomas Webster, a Scotchman, who settled at Hampton, on the coast of New Hampshire, in 1636. Ebenezer Webster served as a common soldier against the French and Indians, but rose to the rank of captain before the war terminated. He received in 1763 the grant of an allotment of land in the township of Salisbury on the upper course of the river Merrimac, and there in 1764 built his log-cabin, when there was no other white man's habitation between it and the settlements at Montreal. He afterwards built a frame-house not far from his log-cabin, on the Elms Farm, and there Daniel Webster was born, and spent his childhood and much of his boyhood. His opportunities for early education were very scanty, working on the farm in summer, and trudging two or three miles through the snow to school in winter. In 1796 he was sent to an

Digitized by Google

academy at Exeter, where he commenced his classical and literary studies. After remaining there a few months, which were well spent, he was placed by his father under the Rev. Samuel Wood, minister of the neighbouring town of Boscawen, with whom he remained from February till August 1797, when he entered Dartmouth College. He remained there four years, completing his college course in August 1801. He then returned to Salisbury, and immediately commenced his law-studies in the office of a neighbouring attorney; but not long afterwards, in order to assist his elder brother, Ezekiel Webster, to obtain a college education, he took charge of a school at Fryeburg, in the State of Maine; and while this duty occupied him by day, he spent his evenings in copying deeds for the registrar of the county. In September 1802 he returned to the attorney's office at Salisbury, and there remained eighteen months.

In July 1804, Daniel Webster removed to Boston, and entered the office of Mr. Gore, an eminent lawyer, afterwards governor of Massachusetts, with whom he remained eight months, studying chiefly the common law, and particularly special pleading. When about to commence practice he was offered the situation, which had become vacant, of clerk in the Court of Common Pleas for the county of Hillsborough, New Hampshire, a situation to which a large salary was attached. By the advice of Mr. Gore, and in opposition to the wish of his father, who was a judge in the court, he rejected the offer. "Once a clerk," said Mr. Gore, "and always a clerk, with no prospect of obtaining a higher position." Immediately afterwards, in the spring of 1805, he was admitted to the practice of the law in the Court of Common Pleas for Suffolk county, when, in order to be near his father, whose health was then infirm, he opened an office at Boscawen, not far from the paternal residence. His father died in June 1806. In May 1807 he was admitted as an attorney and counsellor of the Superior Court of New Hampshire, and in September the same year, relinquishing his office to his brother Ezekiel, he removed to Portsmouth, which was the largest town of New Hampshire as well as the seat of foreign commerce. Ezekiel Webster continued in the successful practice of the law till 1829, when, while pleading a cause in the court at Concord, he suddenly fell down, and expired instantaneously.

Daniel Webster remained at Portsmouth nine years. His practice, mostly in the circuit courts, was very large, but by no means lucrative. In 1808 he married his first wife, by whom he had two sons and two daughters, of whom only one son, Fletcher Webster, survived him. He is a naval officer of the port of Boston. In May 1813 Daniel Webster took his seat in congress as a representative of the Federal party of New Hampshire. Chief Mr. Clay, the speaker, on the committee of foreign affairs, he made his first speech in the house of representatives, June 10, 1813, in moving a series of resolutions on the Berlin and Milan decrees. In a great fire which occurred at Portsmouth in December 1813, his house, furniture, library, and manuscript collections, were all destroyed. In August 1814 he was again returned as a representative to congress. From March to December 1815 he was busily engaged in the practice of the law at Plymouth, whence, in August 1816, after the adjournment of congress, he removed to Boston, where the scene for trial were of higher importance and the practice was more lucrative.

Mr. Webster retired from congress in 1817. He had purchased an estate of about 2000 acres at Marshfield, about thirty miles from Boston, and his time during the next six years was partly occupied with law-business at Boston and partly with the cultivation of his estate. His favourite amusements were angling in the streams and fishing in his yacht. At the end of 1822 he was again elected for Boston, as he was also in 1823 and 1826. In 1827 his first wife died. In January 1828 he took his seat in the senate of the United States, having been elected by the legislature of Massachusetts. He was a candidate for the dignity of President in 1836, but received only the twelve votes of Massachusetts. In the spring of 1839 he visited Europe for the first and only time in his life, and made a tour through England, Scotland, and France. When General Harrison became President in 1841 Mr. Webster was appointed secretary of state. In 1842 he negotiated with Lord Ashburton the Oregon boundary, and the treaty which settled that question between Great Britain and the United States was ratified August 20, 1842. In May 1843 he resigned his situation as minister, and retired to private life, but was again elected senator in 1845. He opposed the war with Mexico in 1846, as he had previously opposed the annexation of Texas. In 1848 he was again a candidate for the Presidency, but was unsuccessful. On the death of General Taylor in July 1850, he was appointed secretary of state by Mr. Fillmore, and he continued to perform the duties of that high office till his death, which occurred October 24, 1852, at his country residence, Marshfield.

Daniel Webster, as a statesman, an orator, and a lawyer, was one of the greatest men that the United States of America have produced. As a statesman his principles were founded on comprehensive views and a wide range of information, legal, constitutional, and historical, but during his later years he was suspected of shaping his course too generally with a view to the presidency. He was a decided Federalist. He expressed his belief that if ever the union of the States should be dissolved, the internal peace, the vigorous growth, the prosperity of the States, and the welfare of their inhabitants, would be blighted for ever; but that while the Union endures, all else of trial and calamity which may befal the nation may be remedied or borne. He was undoubtedly the greatest American orator of his day. His power of fixing the attention and producing an overwhelming effect on a deliberative assembly was unequalled. His style was generally argumentative and solid, never deficient of imagery where suitable, but never flowery. Both as a parliamentary orator and a pleader his speeches were distinguished by extraordinary clearness, compactness, and condensation of statement, sound logic, and, when he was excited, by intense earnestness or vehemence. 'The Works of Daniel Webster,' 6 vols. 8vo, Boston, 1851, consist of his speeches in congress, at the bar, and at public meetings, his diplomatic papers, a few letters, and a lliographical Memoir by Edward Everett.

WEBSTER, JOHN, like many of his great dramatic contemporaries, has left few authentic records of his career, beyond his works. We know not where he was born nor where he was educated. The earliest notice we find of him is in the papers of Henslowe, where he is mentioned as writing plays in conjunction with Dekker, Drayton, Middleton, Munday, Chettle, Heywood, and Wentworth Smith. The first work of his own which he published was 'The White Devil.' This was printed in 1612. In 1623 was published his other great play 'The Duchess of Malfi.' 'Appius and Virginia' was printed in 1654. These are the works upon which the fame of Webster is principally built: and certainly they exhibit him as one of the foremost of that great band of writers who rose up as the later contemporaries and the successors of Shakspere. His pathos is occasionally too laboured, and his command over pity and terror is carried far beyond the region of pleasurable emotion. But he is essentially a great dramatist, accomplishing his purpose with a terrible earnestness which few have excelled. He thus speaks of himself in the outset: he reader prefixed to the 'White Devil:'—"To those who report I was a long time in finishing this tragedy, I confess I do not write with a goose-quill winged with two feathers; and if they will needs make it my fault, I must answer them with that of Euripides to Alcestides, a tragic writer: Alcestides objecting that Euripides had only, in three days, composed three verses, whereas himself had written three hundred; 'Thou tellest truth (quoth he), but here's the difference; thine shall only be read for three days, whereas mine shall continue three ages.'" The works of Webster were first collected and edited by Mr. Dyce, in 1830.

WEBSTER, NOAH, LL.D., was born at West Hartford, in Connecticut, U. S., on the 16th of October 1758, and was descended from John Webster, who, having being one of the original emigrants from Massachusetts by whom the colony of Connecticut was founded, was afterwards governor of the state in the year 1656. Noah Webster entered Yale College in 1774; in 1777 he was withdrawn for a time from his studies by joining the military service under the command of his father, who was captain in the Litchfield militia, during the expedition from Canada; but notwithstanding this interruption he took his degree with great distinction the following year. He was called to the bar in 1781; but, instead of following the profession of the law, he engaged in that of a teacher of youth, opening at Goshen, New York, a school, which he named 'The Farmers' Hall Academy.' His 'First part of a grammatical institute of the English Grammar,' published at Hartford in 1783, was the first of a number of elementary works produced by him, all of which were well received and were generally admitted to be much superior to any that his native country had previously possessed. He also however took a leading part in the discussion of the political questions of the time, both by his 'Sketches of American Policy,' published in 1784, and his other writings in support of the principles of federalism, and by the establishment in 1793 of a daily newspaper in New York. In 1798 he removed to Newhaven, where he spent the remainder of his life. His great work, and that which has chiefly made his name known in this country, his 'New and complete Dictionary of the English language,' was begun in 1807, and the first edition was published in 1828. This work has also been since several times reprinted, is a performance of great labour and care, and was perhaps more precise in its explanations than any previous English dictionaries. Its etymological portion however is more ingenious and showy than really learned or profound. Dr. Webster, whose degree of LL.D., was bestowed upon him by the Faculty of Yale College in 1824, died at Newhaven, May 23, 1843.

* WEBSTER, THOMAS, R.A., was born in Pimlico, London, March 20, 1800. His father, who was in the household of George III., took him while yet a child to Windsor, and had him educated in St. George's Chapel, with a view to his becoming a chorister. This intention was however ultimately abandoned, and the youth was permitted to follow his own bent. In 1820 he entered the Royal Academy as a pupil, and in 1825, he carried off the first prize for painting. His first picture, exhibited at the Suffolk Street Gallery in 1825, 'Rebels shooting a Prisoner,' was decidedly successful. In 1828 his 'Gunpowder Plot' obtained a good place on the walls of the Royal Academy; and pictures in which children were the actors continued to appear in the exhibitions of the Academy, the British Institution, and the Society of British Artists.

In 1841 Mr. Webster was elected an associate of the Royal Academy, and the same year appeared his 'Frown,' and 'Smile,' which have been rendered so familiar by the Art Union Engravings, and his admirable 'Boy and many Friends.' His position was now secured.

Digitized by Google

He had chosen for himself an original and observful bye-path in art, quite distinct from that of Wilkie—at this time well worn by a crowd of followers—and one that led as surely and not less quickly to English homes. Webster's chief object was to observe and delineate that most mirthful, wilful, and changeful of animals the English school-boy, and he has with hearty good-will and unflagging spirit pursued it to the present time—his other pictures being evidently only subsidiary to his main purpose, a mere variation of the theme, or a little temporary change of study. Since his election into the Academy (he became R.A. in 1840) his principal pictures have all been exhibited there. The following is a list of them:—'The Grandmother,' 'The Impenitent,' and 'Going to School,' in 1842: 'Sickness and Health,' a work of great beauty, in 1843; 'Portraits of Mr. and Mrs. Webster,' 'The Toilet Seller,' and 'The Pedlar,' in 1844; 'The Hurdy-Gurdy Boy,' in 1845; 'Please remember the Grotto,' and 'Goodnight,' in 1846; 'A Village Choir,' and 'Instruction,' in 1847; 'The internal economy of Dotheboys Hall,' and 'A Rubber,' one of his best works, in 1848; 'A See-saw,' and 'A Slide,' his masterpiece, in 1849; 'A study from Nature,' 'A Cherry-seller,' 'A Peasant's Home,' and 'A Farm House Kitchen,' in 1850; 'A Chimney Corner,' and 'Attraction,' in 1851; 'A School Play-ground,' 'A. B. C.' and 'A Letter from the Colonies,' in 1852; 'A Dame's School,' in 1853; 'A Villager's Offering,' 'A Breakfast Party,' and 'Peasant Children,' in 1854; 'Spring,' and 'A Race,' in 1855; 'Hide and Seek,' in 1856; 'The Tempter,' &c., 1857.

Few English painters are so generally popular as Webster. His pictures are invariably a centre of attraction in the exhibition room, and in the picture gallery. The subjects are always such as appeal to the common feelings. Every one likes to watch school-boys in real life, and he selects the incidents which are looked at with most pleasure. He is a thoroughly genial observer. Every thing he does is marked by good feeling, kindness, and heartiness. There is a sense of enjoyment about his pictures which is irresistible. His humour is genuine, and unstrained, shaded sometimes with a touch of pathos,—sensibility to which is a never-failing accompaniment of true humour—and heightened occasionally by a bit of broad farce. In his representations of adult life he is scarcely less happy than among children, indeed in the briefest list of his masterworks it would be necessary to include the 'Village Choir,' a picture that Hogarth would have rejoiced in, and 'A Rubber at Whist,' one which Wilkie might have envied. Still it is as a painter of riotous school-boys, that he is most memorable, and his famous 'Slide' is not likely to be forgotten by any visitor to the Academy Exhibition of 1849, or to find in its way a rival among English pictures. Of Mr. Webster's technical merits we have little need to say anything. Unless they had been of a high order, the keenest humour and the happiest fancies, must have failed to raise him to his present position. He draws admirably, and his stories in the clearest manner; always disposes his figures so as to produce a pleasing arrangement of lines, and light and shadow; and colours brightly and harmoniously: but he persists in painting thinly and with an ill-filled pencil, and so instead of presenting a rich, forcible, and rlent appearance, consonant with their true characters, his pictures at the first glance often have a cold and poor appearance. The Vernon collection contains two pictures by Mr. Webster, 'The Truant,' and 'A Dame's School;' and in the Sheepshanks' gallery the nation possesses six of his works, including the admirable 'Village Choir' and 'Sickness and Health.'

WEDEL, GEORG WOLFGANG, was born on the 12th of November 1645, at Golsen in Lusatia, where his father was a Protestant minister. His early studies were pursued at the college of his native place, from whence he went to Leipsic, where, after having received his degree of Master of Arts, he graduated in medicine. He was distinguished whilst a student for his knowledge of languages and mathematics, as well as for his poetical powers. After taking his degree in medicine at Jena, he visited other universities for the sake of improvement, and then commenced the practice of his profession at Gotha. Here he remained till 1673, when he was invited to fill the chair of medicine at Jena. He occupied this chair for upwards of fifty years, and died on the 6th of September 1721. Few men have left behind them more works than Wedel, and among a nation of laborious writers he was one of the most laborious. He published several distinct works in various departments of medical science, and upwards of three hundred academical dissertations. All his works display great research as well as learning. He was not only a good classical scholar, having had it in contemplation at one time to publish an edition of the Greek Bible, but he was well versed in Oriental literature, especially the Arabic. In his medical opinions he was a disciple of Van Helmont and Sylvius, and he adopted without enquiry the absurd opinions of those writers on the question of medicines. Indeed the immense mass of his writings there is much curious and interesting matter, but his mind was too much occupied with the opinions of others to have any of his own, so that his influence has been much less than many whose writings do not amount to a tithe of those which he produced. He had a large private practice, and was remarkable for his kindness to the poor and his punctuality in all public matters, so much so that all his biographers express surprise at the great amount of his labours. He was held in much esteem by the men of his day. He was a member of the Leopoldine Academy, under the name of Hercules,' and also a Fellow of the Royal Society of Berlin and many other learned societies. He was first physician to the Duke of Saxe Weimar, and also to the Elector of Mayence: and in 1694 he was created a count-palatine, and made an imperial counsellor. He was married for the third time in his sixty-third year, and had several children by this marriage. He died suddenly from disease of the heart, in the seventy-seventh year of his age. Although a voluminous writer, he was not in advance of his age in scientific acquirements. It is not therefore a matter of surprise that he was a believer in astrology, an art which he pursued with much zeal.

The following are some of Wedel's numerous works:—'Opologia,' Jena, 4to, 1674; 'Exercitationes Pathologicæ,' Jena, 4to, 1675; 'De Medicamentorum Facultatibus cognoscendis et applicandis Libri Duo,' Jena, 4to, 1678. This work has been translated into English. 'De Medicamentorum Compositione extemporanea ad usum hodiernum accommodata,' Jena, 4to, 1678.

Wedel had several sons, who were distinguished men in the medical profession. ERNST WEDEL was born in 1671, and died in 1702. He followed in the footsteps of his father. He published a work on the diseases of orators, 'De Morbis Concionatorum,' which went through two editions. JOHANN ADOLPH WEDEL was the successor of his father, and was born in 1695. He has also written a large number of works, the chief of them academical dissertations.

WEDGWOOD, JOSIAH, was born on the 12th of July 1730, at Burslem, in Staffordshire, where his father, Thomas Wedgwood, and some other members of his family, were engaged in the manufacture of pottery; a branch of industry then in so very imperfect a state that, independent of the supply of porcelain from China for the use of the higher classes, England imported large quantities of porcelain and various kinds of earthenware from France, Holland, and Germany, for domestic use. His education was very limited; and the low social position of the class from which he sprung is implied, rather than distinctly expressed, by the local historian, Simeon Shaw, who remarks that "scarcely any person in Burslem could write more than mere reading and writing until about 1750, when some individuals endowed the free-school for instructing youth to read the Bible, write a fair hand, and know the primary rules of arithmetic." The little opportunity that Wedgwood had for self-improvement is further indicated by the circumstance stated by Shaw, that at the age of eleven years Josiah worked in his elder brother's pottery as a *thrower*, his father being already dead. The small pox, which left an incurable lameness in his right leg, so as afterwards to require amputation, compelled him to relinquish the potter's wheel at this time he left Burslem, and entered into partnership with a person named Harrison, at Stoke; and during this partnership, which was soon dissolved, his talent for the production of ornamental pottery is said to have first developed itself. He then became connected with a person named Wheildon, with whom he manufactured knife-handles in imitation of agate and tortoiseshell, melon table-plates, green pickle leaves, and similar articles. Wheildon however was derivig considerable profit from other departments of the pottery business, and was unwilling to embark in the new branches for which Wedgwood had a great a predilection. Wedgwood therefore returned to Burslem in 1759, and set up for himself, in a small thatched manufactory, where he continued to make such ornamental articles as are mentioned above. His business being prosperous, he soon took a second manufactory, where he made white shape-ware, and a third, at which was produced the improved cream-coloured ware by which he gained so much celebrity. Of the new cream-coloured ware, Wedgwood presented some articles to Queen Charlotte, who thereupon ordered a complete table service, and was so pleased with its execution as to appoint him potter to her majesty. Wedgwood now became in the habit of which the productions of his ingenuity might be freely inspected, and in his partner, Mr. Bentley, who managed the London business, he found a valuable coadjutor, whose extensive knowledge in many departments of literature and science, and acquaintance with many eminent patrons of art, greatly assisted him in the higher branches of his manufacture, and especially in obtaining the loan of specimens of sculpture, vases, cameos, intaglios, medallions, and seals, suitable for imitation by some of the processes he had introduced. Some persons intrusted to him valuable articles of oriental porcelain for the like purpose; and Sir William Hamilton lent specimens of ancient art from Herculaneum, of which Wedgwood's ingenious workmen produced the most accurate and beautiful copies. While Wedgwood was prosecuting these branches of his art, the Portland or Barberini Vase was offered for sale, and, considering that many persons to whom the original was unattainable might be willing to pay a handsome price for a good imitation of it he endeavoured to purchase it, and for some time continued to offer an advance upon each bidding of the Duchess of Portland, until at length, his motive being ascertained, he was offered the loan of the vase on condition of withdrawing his opposition, and consequently the duchess became the purchaser, at the price of eighteen hundred guineas. Shaw states that Wedgwood sold the fifty copies which he subsequently executed at fifty guineas each, but that his expenditure in producing them is said to have exceeded the amount of the sum thus obtained. According to Allan Cunningham's 'Lives of the most eminent British Painters, Sculptors, and Architects' (vol. iii., p. 286), Flaxman was one of the artists employed by Wedgwood in the preparation of models for the beautiful works of art which he was the first, in modern times, to execute in pottery. By numerous experi-

Digitized by Google

ments upon various kinds of clay and colouring substances, he succeeded in producing the most delicate cameos, medallions, and miniature pieces of sculpture, in a substance so extremely hard, and so well adapted to resist all ordinary causes of destruction or injury, that they appear likely to exceed even the bronzes of antiquity in durability. Another important discovery made by him was that of painting on vases and similar articles, without the glossy appearance of ordinary painting on porcelain or earthenware; an art which was practised by the ancient Etruscans, but which appears to have been lost since the time of Pliny. The indestructibility of some of his wares rendered them extremely valuable for the formation of chemical vessels, particularly those exposed to the action of acids. The fame of his operations was such that his works at Burslem, and subsequently at Etruria, a village erected by him near Newcastle-under-Lyme, and to which he entirely removed in 1771, became a point of attraction to numerous visitors from all parts of Europe.

The result of Wedgwood's talent and energy not only obtained for him extensive patronage and an ample fortune, but were also of the highest importance to the commercial interests of the country. Almost observers that his new wares, his improved forms and chaste style of decoration, and the judgment displayed in all his productions, which were chiefly executed by artists of his own forming, turned the current in this branch of commerce, while the national taste was improved, and its reputation raised in foreign countries. In evidence before a committee of the House of Commons, in 1785, Wedgwood stated that from 15,000 to 20,000 persons were then employed in the district called the Potteries, and much greater numbers in digging coals for them, and in various and distant parts of England, and even Ireland, in raising and preparing flints and clay for his earthenware manufacture; 50,000 or 60,000 tons of those materials being annually conveyed to Staffordshire by coasting and inland navigation. The importance of the manufacture which he had so materially assisted in raising to this prosperous state is further illustrated by the statement that although many of the states of Europe had prohibited the admission of British earthenware, and oth-rs had loaded it with intolerable duties, five-sixths of the quantity made were exported. Wedgwood's success also led to the establishment of improved potteries in various parts of the continent of Europe, as well as in several places in Great Britain and Ireland.

In addition to the attention bestowed by Wedgwood upon the manufacture with which he has inseparably connected his name, he devoted much time for the purpose of display ng his talents in the encouragement of various useful schemes. By his exertions and the engineering skill of Brindley a navigable communication between the eastern and western coast of the island was completed, by the formation of the Trent and Mersey Canal, for which he cut the first sod on the 17th of July 1766, and which was completed in 1770. By means of this undertaking water-communication was established between the pottery district of Staffordshire and the shores of Devonshire, Dorsetshire, and Kent, whence some of the materials of the manufacture are derived; while the greatest facilities were afforded for the exportation of the finished articles. Wedgwood also planned and carried into execution a turnpike-road, ten miles in length, through the Potteries. He was the founder and one of the principal leaders of the association called 'The General Chamber of the Manufacturers of Great Britain,' instituted in consequence of Mr. Pitt's propositions, in the year 1786, for adjusting the commercial intercourse between Great Britain and Ireland; an association by whose prompt and energetic interference most serious evils were averted from the manufacturing interests of this country, and whose proceedings upon the subsequent occasion of a commercial treaty with France, published in the Appendix to Aikon's 'Anecdotes,' contain some curious information respecting British commerce and manufacturing industry.

Wedgwood was a fellow of both the Royal Society and the Society of Antiquaries, and contributed various papers to the 'Philosophical Transactions.' In private character he is said to have been exemplary, and to have made the most liberal use of the ample means which his successful and honourable career placed at his disposal. He died at Etruria, where he had erected a handsome mansion, as well as other factories and residences for his workmen, on the 3rd of January 1795. (See 'Life of Wedgwood,' by Miss Meteyard, 2 vols. 8vo. 1865-66.)

WEENINX, JAN BAPTIST, called 'the Old,' a distinguished Dutch painter, was the son of Jan Weeninx, an architect of Amsterdam, where he was born in 1621, but he lost his father when very young. He was first apprenticed by his mother to a bookseller, but he so perseveringly neglected everything except drawing, that his mother placed him first with a painter of the name of Jan Micker, and then with Abraham Bloemaert at Utrecht, with whom he soon made great progress; he studied afterwards two years with Nicolas Mojert, and acquired his style of execution perfectly. At the age of eighteen Weeninx married the daughter of the landscape-painter Giles Hondekoeter, the grandfather of Melchior Hondekoeter. Four years after his marriage he went alone to Rome, intending to remain only a short time there; but his own inclination, and the many orders he received from the cardinal Pamfili and others, prolonged his stay there to four years, when he was compelled by the importunities of his wife and friends to return to Holland, He died at Utrecht in 1660, aged only thirty-nine. Weeninx excelled in almost every department of painting,—in history, portrait, animal, landscape, and marine painting. He painted in large and in small, and was remarkably rapid in his execution. In a single summer's day he painted three half-length portraits of the size of life, with accessories. Some of his small pictures are very highly finished, but his large works have more merit. He was one of the best painters of birds of the Dutch school. Houbraken mentions as an historical piece of great merit by Weeninx, the Prodigal Son, commonly called 'T Pissend Jongetje: it has been engraved in mezzotint by N. Verkolje. There is a clever etching of Weeninx in Houbraken's work, after a portrait by Bart. vander Helst.

WEENINX, JAN, called 'the Young,' was the son and pupil of Jan Baptist Weeninx, and painted in the same style and the same subjects as his father, whom however he excelled in hunting and sporting piece, and also surpassed in colouring. He was born at Amsterdam in 1644, and after spending some years in the service of the elector John William of the Palz, he returned to his native place, and died there Sept. 29, 1719. His finished all his works with great care. Many of his works are in England. The National Gallery possesses a good example of his pencil, 'Dead Game and Dogs,' No. 238.

WEIDLER, JOHANN FRIEDRICH, was born at Gross-Neuhausen in Thuringia, April 23, 1691, and died at Wittenberg, Novemb-r 30, 1755. He succeeded Wolff in the chair of mathematics at the latter place in 1721. He wrote a large number of works, of some of which the bare enumeration will be sufficient: as, 'Institutiones Mathematicæ,' Wittenberg, 2 vols. 8vo, 1718, reprinted five times at least; 'De Characteribus Numerorum Vulgaribus,' Wittenberg, 4to, 1727 (this is by J. F. and George Immanuel Weidler); 'Tractatus de Machinis Hydraulicis,' Wittenberg, 4to, 1728 and 1738; 'Institutiones Geometriæ Subterraneæ,' Wittenberg, 1751 (2nd ed.); 'Institutiones Astronomiæ,' Wittenberg, 4to, 1754.

The memory of Weidler is now preserved by two useful works, the 'Historia Astronomiæ,' Wittenberg, 4to, 1741, and the 'Bibliographia Astronomica,' Wittenberg, 4to, 1755, of which the latter also contains supplements to the former. The history of astronomy was, at the time it was published, the most regular, most learned, and most accurate history of a single science which had ever been published; it is to this day a very convenient book of reference, and the more so as it rather should be called the annals of astronomy than the history of astronomy. The second work was taken entire by Lalande into his 'Bibliographie Astronomique,' by which work it is therefore supplanted, except for the supplements.

WEINBRENNER, FRIEDRICH, one of the most eminent German architects of his time, was born November 9th, 1766, at Carlsruhe, where his father was a carpenter and builder. Losing his father before his future destination was fixed, his studies were rather irregular, he being directed only by the advice of his brother, who was some years older than himself. Inclining himself from him architectural into matters of practical routine, Weinbrenner commenced his artistical 'Wanderjahre' in the spring of 1788, and set out for Zurich, where he remained a considerable time, in consequence of being engaged to superintend some timber constructions. He then went on, as long as his engagements would permit, to Vienna, and after examining the architectural monuments of that capital, he proceeded to Dresden and Berlin, where he became acquainted with the brothers Genelli, architects of considerable repute, who urged him to visit Italy, and he accordingly set out for Rome in June 1792, in company with Castens (Carstens, Asmus Jacob), and another young artist named Cabot.

At Rome, Weinbrenner soon became conscious that, in order to prove a profitable one, the study he had imposed upon himself required system and perseverance, and that more historical and antiquarian knowledge than he then possessed. The time that was not occupied in examining and drawing buildings was devoted to literary research and books; yet not entirely, for the state of his finances compelled him to earn something to provide for his immediate wants, which he did by giving instruction in architecture. Many strange alterations then at Rome took lessons of him, and, among the rest, Prince Augustus of England (the late Duke of Sussex). Weinbrenner remained at Rome till 1797, with the exception of a considerable interval spent by him at Naples. On returning to Carlsruhe, he found a very promising opening for his talents. Besides being almost immediately appointed 'Bau-inspector,' he had early opportunities of displaying his professional ability in the erection of the new synagogue and one or two private mansions. Notwithstanding the favourable commencement, he gave up his appointment two years afterwards, and went to settle at Strasbourg, where his wife's relations (Margaretha Arnold, whom he had shortly before married) resided, and were many of them artists. The change however proved an imprudent one; Strasbourg became harassed by hostilities, and he found himself without other occupation or resource than teaching a few pupils. At this juncture he was invited by the Hanoverian government, through the recommendation of Prince Augustus, to inspect and improve the prisons of that country, but being invited to resume his former appointment at Carlsruhe, through the immediate emolument were offered, and while—not above a quarter of what he would have had at Hanover—he resolved to accept it, as there seemed to be upon the whole a fairer prospect of his signalizing himself in his profession. Nor had he reason afterwards to repent of the choice he made, for from that period he was constantly employed on various improvements and embellishments in the capital

Digitized by Google

of Baden and other parts of its territory. At Carlsruhe alone he erected many buildings, among others the Roman Catholic church, the Lutheran church, theatre, Ettlinger gate, Standesshaus, museum, mint, Hochberg palace; and at Baden the 'Conversationshaus' or assembly-rooms, baths, and 'Antiquitäten halle,' or museum, &c., besides the Leopold summer palace, and various private houses and smaller buildings. Of churches, mansions, villas, &c. erected or designed by him in other places within the territory of Baden, the number is very considerable; and there are several by him in other parts of Germany—Leipzig, Strasbourg, Göttingen, and Düsseldorf. Being so numerous, his works display various degrees of merit according to the respective opportunities afforded him; but taken collectively they manifest a great improvement in style, with individuality of character, and fresh and original combinations, instead of the mere routine of design. He applied himself to his art with higher views of it than were then entertained among his countrymen, and diffused a similar feeling for it through the next generation of the profession, having reared up to it a great number of those who now rank high among the living architects of Germany. Nor was his instruction confined to them exclusively, for he published a variety of treatises on different branches of architectural study, namely, two on the orders of architecture, 'Zeichnungslehre,' 1810; 'Optik,' 1811; 'Perspectivlehre,' 1817 24; 'Ueber Form und Schönheit,' 1819; 'Ueber Architektonische Verzierungen,' 1820, &c., besides a work on theatres, and a variety of papers on architectural and artistical topics in the 'Morgenblatt' and other literary journals. Though varied, his application to his professional pursuits and studies continued uninterrupted almost to the very last; for although his health had begun to be impaired some time before, he was taken off somewhat suddenly, March 1st, 1826, after enjoying the society of some friends on the preceding evening.

(Friedrich Weinbrenner, von Aloys Schreiber.)

WEISS, CHRISTIAN SAMUEL, was born at Leipzig, on February 26, 1780. After receiving a careful education in the classical schools and the University of Leipzig, he proceeded to the School of Mines at Freiberg, where he became one of Werner's most distinguished scholars. He then travelled, visiting the volcanic districts of the south of France, and in Paris attended the lectures of Haüy. On his return, he passed his examination, and in 1808 was made professor of physics in the University of Leipzig. In 1811 he removed to that of Berlin as professor of mineralogy, and he is also director of the mineral collection in that city, and a member of the Academy of Sciences. In 1813 he published an essay, 'Über die natürlichen Abtheilungen der Krystallisations systems' (on the Natural Divisions of the system of Crystallisation), a system which met with general approbation, and contributed much to the present state of the science. In this, indeed, he takes the form as the basis of his classification, he by no means rejects the results of chemical investigation. His mineral system is also a natural one, attending chiefly to the determination of species. Besides educating a number of excellent mineralogists, he wrote many essays in the publication of the Natural Philosophy Society at Berlin. [See Supplement.]

WEISSE, CHRISTIAN FELIX, was born on the 8th of February (28th of January, Old Style), 1726, at Annaberg, in the present kingdom of Saxony. His father, Christian Heinrich Weisse, had been rector of the public grammar-school at Annaberg, and from 1727 director of the gymnasium at Altenburg, was a distinguished scholar, whose works, 'De Stylo Romano,' and 'Latium in Compendio,' were much esteemed in their time. Young Weisse lost his father in his early age. After having finished his preparatory studies in the gymnasium at Altenburg, he went to the university of Leipzig in 1745, where he studied the classical languages and antiquities under Ernesti. At Leipzig he became acquainted with Lessing, who directed his attention to the modern languages, especially to the English, and encouraged him to cultivate his poetical talents. Weisse however did not respond to the expectations of Lessing. His favourite passion was the drama, which in Germany at that time was little better than a stiff imitation of the French school, and the French taste was so prevalent that Weisse was unable to contend against its influence, as we see from the many tedious tragedies which he wrote during the period from 1751, in which year he published his first dramatical essay, 'Die Matrone von Ephesus,' till 1767. In this year he published 'Die Befreiung von Theben' (The Delivery of Thebes), which was his first drama written in blank verse. He had previously used the Alexandrines, in which the German dramas were generally written, and when he abandoned this verse at the suggestion of Lessing, and adopted the blank verse of the English drama, or even prose, he fell into great extravagances, and showed that he was anything but a tragic writer. Of this his 'Romeo und Julie,' in which he fancied he could improve on Shakspere by strictly following the novel of Bandello, is a sufficient sample. In his 'Richard III.' he showed that he was thoroughly unable to conceive any great passion: for every passion he had one mould, such as the character of Nero, of Alexander, of Medea. 'Richard III.' however has two great merits: it was the last tragedy in the French taste which appeared on the German stage, and it occasioned Lessing to write his excellent observations on Aristotle's theory of the drama and on Shakspere.

The severe criticism of Lessing and the consciousness of his own weakness led Weisse to abandon tragedy, and to write comedies, vaudevilles, and operas, in which he had much more success. His best comedy, according to Lessing, is 'Amalia,' in five acts. His vaudevilles and operas were set to music by Wolf, Hiller, and other eminent composers, and his little arias became national songs. He supplied many of the theatres, and the splendour of the court of the kings of Poland and electors of Saxony at Dresden gave him opportunities for the exercise of his talents. The remunerations for his productions, and the high appointments which he received, as chief receiver of the taxes at Leipzig, an office which he held till his death, put him not only above want, but procured for him all the means of leading a comfortable life. In 1760 he became editor of the 'Bibliothek der Schönen Wissenschaften und freien Künste,' a periodical which was then much esteemed in Germany.

The appearance of Wieland, Göthe, Schiller, and so many other eminent men during the latter part of the 18th century, induced Weisse, who was unable to become their rival, to change his subject. He now wrote for children. Weisse and Basedow became the founders of a new system of education in Germany; and while Basedow's views principally concerned the intellectual education in schools, Weisse directed his literary activity towards domestic education. His 'A, B, C, und Lesebuch für kleine Kinder,' Leipzig, 8vo, 1772, ran through six editions, and was the best spelling book hitherto published in Germany. He also published 'Kleine Lieder für Kinder,' and translated several little English works for children, as well as various articles of the 'Spectator' on the same subject. He also published 'Wochenblatt für Kinder,' which, in 1775, he changed into a quarterly journal called 'Der Kinderfreund' (The Children's Friend). This celebrated work treats on the domestic education of children in a history of a family, from their birth to the time when they leave the paternal roof, the daughters to be married and the sons to follow some occupation. The life of this family, the earlier amusements of the children, their education, the various branches of their instruction, and their amusements, are described: a great number of tales are introduced, which they are supposed to tell to one another; and several little comedies, which the members of the family perform for the entertainment of their friends. The 1775 to 1782 the 'Kinder-Freund' went through five editions, among which two are in twenty-four volumes, and three in twelve. The 'Kinder-Freund' was continued in the 'Briefwechsel der Familie des Kinderfreundes,' Leipzig, 12 vols. 8vo, 1783-93, which gives the history of the family during the first years after the children had left their house. Berquin's celebrated 'L'Ami des Enfans' is an imitation of the 'Kinder-Freund,' and in many parts a translation. There is scarcely a European language into which some of Weisse's works for children have not been translated, either entirely or in extracts or abridgements. Weisse's literary activity was immense, and lasted till his death, although by a fall from a ladder in his library, in 1792, he almost lost the use of his hand, and was obliged to dictate. He published many translations from the English, especially works for the use of children and young persons of both sexes, such as the works or part of the works of Richardson, Law, Moore (the Fables), James Fordyce, Brooke, Sterne, Franklin, some of the poems of Ossian, several odes of Dryden, Pope, Congreve, and many other works. The reputation of Weisse from the time when he began to write for children was very great. However in all his works on education there are indications that the author's system was rather artificial, and more adapted to the drilling of children than the formation of character. Of late he has often been severely criticised, but his contemporaries held him in high estimation.

Weisse died on the 16th of December 1804. His principal works are: —'Beiträge zum Deutschen Theater,' 5 vols. 8vo; 2, 'Trauerspiele,' Leipzig, 5 vols. 8vo, 1776-80. Several of his tragedies were published separately; 3, 'Lustspiele,' 3 vols., 2nd edit., 1783; 4, 'Komische Opern,' 2 vols., 1777. These operettas and vaudevilles, with the music of Hiller, are published separately, as the 'Dorfbarbier,' Leipzig, fol. 1771; 5, 'Kleine Lyrische Gedichte,' Leipzig, sm. 8vo, 1772: the songs for children are contained in the third volume; 6, 'Lieder für Kinder, mit Melodien in Musik gesetzt von J. A. Hiller;' 7, 'Schauspiele für Kinder,' Leipzig, 3 vols. 8vo, 1792, is a collection of the dramas for children contained in the 'Kinder-Freund;' 8, 'Lieder und Fabeln für Kinder und junge Leute,' edited by Frisch, Leipzig, 1807; 9, 'Bibliothek der Schönen Wissenschaften und freien Künste,' Leipzig, 12 vols. 8vo, each containing 2 parts, 1760-66. This work is important for the literary history and the biography of the scholars and writers of Germany who lived in the 18th century. A catalogue of the biographies and articles contained therein was published at Leipzig in 1767. Weisse, as already observed, was the editor of this work from 1760; his editorship began with the fifth volume. The number of his own contributions is very great; his criticism of Wieland's translation of Shakspere is remarkable. The work was continued under the title, 'Neue Bibliothek der Schönen Wissenschaften und freien Künste,' 72 vols., Leipzig, 1765-1806; the latter part of which was edited by Weisse and Dyk, who, after the death of Weisse, was the sole editor. The 'Bibliothek der redenden und bildenden Künste' is a continuation of the 'Neue Bibliothek,' &c.

A complete catalogue of Weisse's works and other literary productions is given by Jördens. In 1826 a school for poor children was founded by subscription at Annaberg, the birthplace of Weisse, which

Digitized by Google

received the name of Weissens-Stiftung' (Weisse's Institute). Weisse was married to a sister of the celebrated philosopher Platner.

CHRISTIAN ERNST WEISSE, a son of Christian Felix, born 1766, became professor of feudal law, and afterwards of criminal law, at Leipzig. He died in 1832. He was a distinguished jurisconsult of the old historical school, but he was unable to keep pace with the ideas of the 19th century. His principal works are:—1, 'Geschichte der Knr-Sächsischen Staaten,' 4 vols. 8vo, Leipzig, 1802-6, the continuation of which is, 2, 'Neueste Geschichte des Königreichs Sachsen seit dem Prager Frieden bis auf unsere Zeiten,' 3 vols. 8vo, Leipzig, 1808-12. This is a good work, but written in a very dry style, and often overcharged with details, which however make it very useful for those who are investigating some parts of the history of Saxony. 3, 'Museum für Sächsische Geschichte, Literatur, und Staats-Kunde,' 3 vols. 8vo, Leipzig, 1794-96: the continuation of this work is, 4, 'Neues Museum für Sächsische Geschichte,' &c., 4 vols. 8vo, Freiberg, 1800-4, an excellent collection of documents and other materials for the history of Saxony. 5, 'Lehrbuch des Sächsischen Staatsrechts,' 2 vols. 8vo, Leipzig, 1824-27: this compendium is still considered the best work on the constitution and the public law of Saxony, and continues a standard work even since the constitutional changes of 1831.

CHRISTIAN HERMANN WEISSE, a son of Christian Ernst Weisse, born in 1801, and professor of philosophy at Leipzig, obtained a distinguished rank among German philosophers by the publication of his work 'System der Aesthetik als Wissenschaft von der Idee der Schönheit,' 2 vols. 8vo, Leipzig, 1830.

* WELCKER, FRIEDRICH GOTTLIEB, a celebrated classical archæologist, was born on November 4, 1784, at Grünberg, in the Grand Duchy of Hesse. After receiving an academical education at Giessen, he visited Rome in 1806, where a residence of two years, and an acquaintanceship with the archæologist Zoega, fixed his future pursuits. While in Rome he wrote an essay 'Über die Hermaphroditen der alten Kunst,' which was printed in the Heidelberg 'Studien.' In 1809, after his return to Germany, he was created professor extraordinary of archæology and Greek literature in the University of Giessen, and in 1811 contributed materially to Zoega's 'Basreliefen Rome.' In 1816 he removed to Göttingen as professor of the university there, and in 1819 he was created professor of philology and head librarian in the newly instituted University of Bonn, the advancement of which he has earnestly and successfully contributed. In 1826 however, and again in 1832 his political writings brought him into suspicion, and he was tried for sedition and in both cases was acquitted. Besides his political essays his writings have been very numerous. Among them we may mention 'Zoega's Leben, Samulung seiner Briefe und Beurtheilung seiner Werke' (The Life of Zoega, with a collection of his Letters, and a Criticism on his Works), 1810; the 'Komödien of Aristophanes,' 1810-11, a translation remarkable for its closeness of the Frogs and the Clouds, which has unfortunately been carried no further. "Fragmentia Alcmanis lyrici,' 1815; 'Hippocratis et Anacrii iambographorum fragmentum,' 1817; 'Philostratorum imagines et Callistrati statuæ,' 1825, in conjunction with Jacobi, and 'Theognidis reliquiæ,' 1826, all of which were favourably received by the learned world; 'Über eine Kretische Colonie in Theben, die Göttin Europa und Kadmos' (On a Cretan colony in Thebes, the Goddess Europa and Cadmus), 1824; 'Die Aeschyleische Trilogie Prometheus und die Kabirenweihe zu Lemnos' (The Prometheus Trilogy of Æschylus and the Consecration of the Cabiri at Lemnos), 1824. An attempted contradiction to his theory by G. Hermann gave occasion to 'Nachtrag nebst einer Abhandlung über das Satyrspiel' (A Supplement, together with a dissertation on the Satyric Drama), 1826; 'Der epische Cyclus, oder die Homerischen Dichter' (The epic Cyclus, or the Homeric Poets), 1835; 'Die griechischen Tragödien mit Rücksicht auf den epischen Cyclus' (The Greek Tragedy in relation to the epic Cycle), 1839. 'Kleine Schriften zur griechischen Literaturgeschichte' (Minor Writings on Grecian Literary History), 1844-45; and 'Alte Denkmäler' in 5 vols, 1849-51. From 1834 in conjunction with Näke, and since 1842 with Ritschl, he has conducted the 'Rheinische Museum für Philologie,' to which he has contributed richly, partly from the treasures of the art-museum at Bonn, which through his efforts has been greatly increased, and the collection therein made of great importance. This collection he has described in the 'Neuester Zuwachs des akademischen kunstmuseums in Bonn.'

* KARL THEODOR WELCKER, his brother, was born at Wilden in Upper Hesse, on March 29, 1790, and has throughout his life led an active political life. His political writings have been numerous and effective, but having taken a liberal course he has been subjected to several legal trials, in all of which he has been acquitted. Although sufficiently energetic he has ever kept within the bounds of the law, and as his integrity and patriotism have been generally acknowledged, his liberal opinions did not prevent him attaining the rank of a counsellor of state of Baden. He took an active part in the National Assembly in 1848, but withdrew from it, and from political affairs generally, in 1849. In 1850, however, he was again elected a member of the Baden Lower Chamber.

WELDON, JOHN, one of our most eminent composers of cathedral music, was born at Chichester, and studied his art under the famous Henry Purcell. At an early age he became organist of New College, Oxford; in 1701 was appointed gentleman-extraordinary of the chapel-royal; in 1708 succeeded Dr. Blow as organist thereof; and seven years after, when a second composer was added to the court establishment, he was chosen to fill that situation which then was an active and responsible one. He was a remarkable pluralist, for, while holding all these offices, he was also organist of St. Bride's; and George I., having presented the parish of St. Martin-in-the-Fields with an organ, Mr. Weldon, perhaps in compliment to the king, says Sir John Hawkins, was elected organist. "The reason that moved the king to this act of munificence was (the same historian conjectures) a singular one. The parish had chosen his majesty their churchwarden, and he executed the office for two months; but at the end thereof he grew tired of it, as well he might, and presented the parish with that noble instrument which is now in the church." ('Hist.,' v. 60.)

Weldon's compositions were chiefly for the church; but he assisted in setting Congreve's masque, 'The Judgment of Paris,' to music, in which is the air 'Let ambition fire thy mind,' a lovely melody, and still fresh. This was introduced by Arne in 'Love in a Village,' and is yet known to all as 'Hope, thou nurse of young desire.' Some of his songs are to be found in the 'Mercurius Musicus,' and in other collections now become rare. Among the number is 'From grave lessons and restraint,' a very popular air, and as such remembered in Hawkins's time, who has given it in his fifth volume.

The fame of this composer is mainly built on his anthems 'In Thee, O Lord,' and 'Hear my crying,' of which Hawkins justly observes, "it is difficult to say whether the melody or the harmony of each be its greatest excellence." Dr. Burney speaks slightingly of Weldon's powers; and it is probable that on this subject he was either prejudiced, or imperfectly acquainted with the works he criticised. Weldon died in 1736, and was succeeded in the chapel-royal by Dr. Boyce.

WELLESLEY, RICHARD COLLEY, MARQUIS WELLESLEY, was the eldest child of Garrett, first Earl of Mornington, and of Anne, Countess of Mornington, who was daughter of Arthur, first Viscount Dungannon. He was born in Grafton-street, Dublin, on the 20th of June 1760. The Earl of Mornington died in 1781, before his son came of age; the countess survived till 1831.

The Earl of Mornington, a man of considerable general abilities, and who is well remembered as a musical composer, paid great attention to the education of his family. The future Marquis Wellesley was sent at an early age to Eton College, whither he was in due time followed by his brothers—the future Lord Maryborough, Arthur Wellesley, afterwards Duke of Wellington, Lord Cowley, and the Rev. Gerard Wellesley. All the brothers occupied a respectable place among their schoolmates, but the eldest surpassed them, and even stood high for classical attainments among the great body of his contemporaries, both at Eton and the university.

The first act of the young Lord Mornington, on attaining his majority, was to assume the numerous hereditary obligations of his father, and place his estate under the management of his mother. Encouraged by the reputation he had acquired with his teachers and schoolfellows, he selected political pursuits as the means of starting him in a career that might re-establish the shattered fortunes of the family. With that view he took his seat in the Irish House of Lords as soon as he had come of age, and continued a member of that body till the Union. This proved however too narrow a theatre for his abilities or his ambition. He kept up the English connections which he had formed during the time of his education, and having been returned a member of the British House of Commons by the borough of Beeralston, became a frequent visitor in London.

The first opportunity he had of attracting substantial notice occurred during the regency debates of 1789. The British Houses of Parliament, on the illness of George III., proposed that the Prince of Wales should assume the office of regent subject to certain conditions or restrictions. The Irish Legislature proposed that his powers should be unrestricted. The Earl of Mornington strenuously supported restrictions in the Irish House of Lords, maintaining that the full powers of the crown should not be assumed by any one during what might prove but a temporary indisposition of the king. These views, which coincided exactly with those of George III., induced the king, whose attention, after his recovery, had been called to the minorities in the Irish Houses of Parliament, to take an interest in the young statesman who found the toils of one legislative body too little for his activity. At the next general election the Earl of Mornington was returned for the borough of Windsor, sworn in a member of the Irish privy council, and elected one of the knights of St. Patrick.

He was soon after appointed one of the lords of the treasury, and in 1793 he was sworn in a member of the British privy council. He continued to make such steady progress in the favour of the king and the confidence of the minister, that he was nominated to succeed Lord Cornwallis in the government of British India. He was raised at this time to the British peerage by the title of Baron Mornington. The marquisate which he subsequently received was merely an Irish title. As a British peer he was never raised to a higher rank than that of baron.

Lord Mornington was appointed Governor-general of India on the 4th of October 1797; he reached the Ganges in May 1793, after touching at the Cape of Good Hope and the Isle of France by the way, having some time before been preceded by his brother, Colonel Arthur

Digitized by Google

Wellesley, who was to commence his brilliant career under his auspices. He retained the supreme command in India till August 1805, when he embarked to return to Europe.

The governor-generalship of the Earl of Mornington, or, to use the title by which he is best known, and which was conferred upon him in December 1799, of the Marquis Wellesley, was an eventful one. The moment of his assuming the command appeared to be a critical time. Bonaparte had accomplished the conquest of Egypt, and was supposed to contemplate a blow at our Indian dominions. Tippoo Saib retained a resentful recollection of his losses, and was encouraged by French emissaries to attempt the recovery of the district of Coimbatore and the hill forts, which he had been obliged to surrender. The first step of the governor-general under these circumstances was to force the Nizam to disband his French troops; the next was to open negotiations with Tippoo, in order to detach him from the French alliance. Failing in this, and having detected Tippoo's negociations with France, he prepared for war. Great exertions were made by the Indian government to organise the Native and improve the British troops. With his characteristic promptitude of decision, the governor-general resolved to strike home at once. Warlike operations commenced with the victory of Mallavelly, which displayed the high condition of the Anglo-Indian army. Following up this impression, General (afterwards Lord) Harris was ordered to invest Seringapatam, which, after a siege of a month, was taken by assault, and the Sultan slain. His territories were partitioned. The capital with the districts on the coast, including the fort of Mangalore, was retained by the East India Company; compensation was made to some native allies; and the remainder of Tippoo's territories, with the nominal sovereignty over the whole, was restored to the representative of the ancient Hindoo sovereigns, then a child five years of age. So complete was the effect of these victories and the subsequent arrangements in impressing the minds of the natives with a sense of the strength and resolute character of the Anglo Indian government, that General Wellesley (in one of the despatches published by Colonel Gurwood) writes to his brother, that he "only waits to know what countries they are which the governor-general wishes to take possession of."

The next efforts of Lord Wellesley were directed to the extension of the commercial intercourse of India, and to the commencement of those important financial reforms which eventually raised the revenue of the Company from seven millions to upwards of fifteen millions annually, with advantage to commerce and without injustice to the inhabitants. His projected extension of the commerce of India was in part thwarted by the monopolist spirit which at that time prevailed among the directors of the East India Company. Nerved to exile in his zeal by this disappointment, he set himself to complete the internal organisation of the British empire in Asia, and to establish it on a broader basis. With this view he undertook a vice-regal progress through the northern provinces, visiting the native princes with a pomp equal to their own, redressing grievances, checking enemies, and conciliating friends.

In 1801 he was again involved in warlike operations. He in that year despatched a considerable force up the Red Sea to assist in wresting Egypt from the power of France. He next turned the British arms against the Mahrattas, and, after a severe struggle, conquered the whole country between the Jumna and the Ganges, and compelled Scindiah and the Rajah of Berar to make peace. Sir Arthur Wellesley's victory of Assaye and the crowning battle of Lassawaree terminated a war directed with energy and decision of character that gave good and true augury of the future career of the commanding officer on a more important and conspicuous field. Without undervaluing the political wisdom of the Marquis Wellesley, it may safely be said that had he not possessed so able a general as his brother, the result of the war might have been less favourable; and that, had it been less favourable, his policy would have been judged of very differently from what it has been.

After six or seven years of service in India, the Marquis Wellesley became desirous of returning to England. Such however was the estimation in which his services were held at home, that some years elapsed before he procured his recal. Even a change of ministry failed to obtain the release he solicited. At last he was allowed, in 1805, to resign the government of India, and he embarked for Europe in the month of August. He was received with every demonstration of respect and approbation by the government and the East India Company. Complaints were indeed heard that his administration had been unwarrantably expensive, and that he had been guilty of oppression towards the native powers, especially the Nabob of Oude. Articles of impeachment were presented against him (without effect) in the House of Commons by Mr. Paull. But the judgment of the public then (and the time which has since elapsed, with all its gradual disclosures, has only confirmed that judgment) was, that without adopting all the exaggerated eulogies of the panegyrists of the Marquis Wellesley, his policy was, in the circumstances of our Eastern empire, the wisest and most just that could have been adopted. His government marks the commencement of a better era of English rule in India.

The Marquis Wellesley on his return from India again took part in the proceedings of parliament. He had no great sympathy with the opposition; that could scarcely be expected from one who might almost be regarded as the personal friend of the king. But he was far from being a strenuous supporter of Mr. Perceval's government, or even, at a subsequent period, of Lord Liverpool's. The Pitt party had been disorganised by the death of Pitt at the time that Lord Wellesley returned from India, and it was not again consolidated until Lord Liverpool was placed at the head of affairs. Besides, the Marquis's position as governor of a distinct empire, and his protracted absence from England, had impressed him with a feeling of personal consequence which ill qualified him to perform a subordinate part under any of the sectional leaders of the predominant party, and had to a great extent emancipated his mind from the mere party conventionalities of this country. But in so far connected with the general policy of administration that he was a zealous advocate of the war against Bonaparte, but his mind was much too liberal to sympathise with narrow-minded and oppressive views in home politics; although, bred under Mr. Pitt and matured in India, he cared little for the constitutional views which were then popular.

In 1807 Lord Wellesley evaded the urgency of the king, who wished him to become a secretary of state in the Duke of Portland's cabinet. In 1808 he rendered ministers efficient service by his vindication of the expedition to Copenhagen. He was soon afterwards appointed ambassador to Spain. A short residence in Spain convinced him that, if Bonaparte were to be driven out of the Peninsula, it must be by British cessing to play the part of a mere auxiliary, and taking the lead in the war. On the death of the Duke of Portland he was recalled, and was with difficulty persuaded by the king to accept the appointment of secretary of state for foreign affairs with Mr. Perceval. He held this office from December 1809, till January 1812, when he resigned on account of the difference of opinion existing between him and his colleagues on different points, especially respecting the Roman Catholic claims and the inefficient conduct of the war.

After the assassination of Mr. Perceval, in May 1812, Lord Wellesley undertook, at the request of the Prince Regent, to form a coalition government. The distinction between the parties of that day was still so strongly marked to admit of their being fused together, and their leaders were too wise or too honest for a coalition. In three days Lord Wellesley saw that the undertaking was hopeless, and resigned his charge. On the 8th of June, Lord Liverpool announced in parliament that he was at the head of the government. On the 1st of July Lord Wellesley brought forward a motion in favour of the Roman Catholic claims in the House of Peers, similar to that which Mr. Canning had carried a few days earlier in the House of Commons. It was lost by only one vote, and that vote a proxy. He continued for ten years from this time to offer a manful opposition to government. During the Peninsular war he had repeated occasions to attack ministers for their inadequate support of his brother. In 1815 he condemned in unqualified terms the disregard to commercial interests that marked the treaties by which the peace of Europe was consolidated.

In December 1821, he accepted the appointment of lord-lieutenant of Ireland, an office which he continued to hold till March 1828. The nomination of the Marquis Wellesley, a well-known advocate of the Roman Catholic claims, to this high office, raised on the one hand the expectations of the professors of that religion, and excited on the other great discontent among the Protestant ascendancy party. His arrival was the signal for an outburst of the fiercest party spirit. The Orangemen of Dublin insulted the lord-lieutenant in the theatre, and the southern counties became the scene of insurrectionary movements. The viceroy commenced his administration with an attempt to adopt a conciliatory policy, but the times did not admit of its being followed up. It was deemed necessary to have recourse to an Insurrection Act and other coercive measures. Yet the personal character of the Marquis Wellesley continued to command respect; his impartiality and kindly disposition escaped imputation. The Earl of Liverpool's retirement from public life had no effect upon the position of Lord Wellesley, for both Mr. Canning and Lord Goderich were favourable to the Roman Catholic claims. But when the Duke of Wellington came to assume the reins of government, the Duke's declaration which he made upon the subject left the lord-lieutenant of Ireland no alternative but to resign.

On the formation of the Grey ministry the Marquis Wellesley accepted office under it. In 1831 he was appointed lord-steward. In September 1833 he resigned that office, and was once more appointed lord-lieutenant of Ireland. On Sir Robert Peel's brief accession to office (1834-35), the Marquis Wellesley resigned, though urged by his brother to remain. He accepted the office of lord-chamberlain on the formation of the second Melbourne ministry, in April 1835, but resigned it in the course of the same year, and never afterwards filled any public employment. He died at his residence, Kingston-house, Brompton, on the morning of Monday, the 26th of September 1842, in the 83rd year of his age.

The Marquis Wellesley was twice married. His first wife, Hyacinthe Gabrielle Roland, he married on the 1st of November 1794. They had had several children who died young, but none after marriage. They separated soon, and were not again reconciled. The first Lady Wellesley died in 1816. On the 29th of October 1825, at the advanced age of 65, the Marquis Wellesley again married. His second wife was an American lady, daughter of Mr. Richard Caton (granddaughter of the eminent revolutionary patriot Carroll of Carrollston), and widow

Digitized by Google

of Mr. Robert Patterson. By this lady, who survived him, he had no children.

Lord Wellesley was a man of superior powers and of enlarged views. His administration in India was brilliant and productive of lasting good; though part of the credit must be attributed to the high cast of official talent developed in the East India Company's service under the judicious arrangements of that body, and part to the efficient assistance he derived from his brother and the other generals in the field. The marquis was an elegant scholar, of a disposition too delicate to stand the ruder shocks of party warfare. His prosperous career of civil service was more flattering to his ambition than productive of emolument. His father's debts were paid by him voluntarily, but he was unable to preserve the family estates. In 1837 the directors of the East India Company passed a resolution to the effect that they had reason to believe the Marquis Wellesley was involved in pecuniary difficulties, and that therefore they deemed it their duty to offer him some further acknowledgment of his distinguished services. The resolution proceeded to state that, on the fall of Seringapatam, the sum of 100,000*l.* was set apart for the Marquis Wellesley—a grant which on his suggestion was abandoned to the army. It was afterwards determined to vote him an annuity of 5000*l.*, which had ever since been paid; but the Court of Proprietors believed that the Marquis derived very little advantage from the grant, and under these circumstances it was resolved that the sum of 20,000*l.* be placed in the hands of trustees for his use and benefit. This grant his lordship accepted.

Some Latin poems by the marquis were published early in life. In 1805 a thin quarto was published in London, purporting to be a history, by the marquis, "of the important transactions in which have taken place in India during his administration." It is a mere translation from a French version of some of his intercepted despatches, published at Paris. In 1836 Mr. Montgomery Martin published, in five volumes, 8vo, at the expense of the East India Company, 'Despatches, Minutes, and Correspondence of the Marquis Wellesley, during his administration in India;' and in 1838, the same gentleman republished, in a thin 8vo volume, from Parliamentary papers, 'Despatches and Correspondence of the Marquis Wellesley, during his Mission to Spain.' His lordship also published a number of occasional pamphlets:—'Substance of a Speech in the House of Commons on the Address in 1794;' 'Notes relative to the Peace concluded with the Mahrattas;' 'Letters to the Government of Fort George, relative to the new form of government established there;' 'Letters to the Directors of the East India Company on the India Trade,' &c.

WELLINGTON, DUKE OF. Arthur Wellesley was born, as commonly stated, on the 1st of May 1769, at Dangan Castle, in the county of Meath, Ireland; but in the registry of St. Peter's Church, Dublin, it is recorded that "Arthur, son of the Right Honourable Earl and Countess of Mornington," was there christened by "Isaac Mann, archdeacon, on the 30th of April 1769." It is probable therefore that he was born in March, at Mornington House, Dublin, the town residence of his parents. After the battle of Waterloo he kept his birthday on the 18th of June, the anniversary of that important victory. He was the third son of the first Earl of Mornington. [MORNINGTON, EARL OF.] The family name was originally Wesley, derived from Garret Wesley, of Dangan Castle, and so continued till 1797, when the name was altered to Wellesley by the first Marquis Wellesley. Arthur Wellesley was educated at Eton College, where he was transferred to private tuition at Brighton, and afterwards to the military academy at Angers in France.

On the 7th of March 1787, the Hon. Arthur Wellesley received his first commission as an ensign in the 73rd regiment of foot. He was gazetted under the name of Wesley, and the young officer is so designated in contemporary descriptions of his early services. In December 1787 he was promoted to the rank of lieutenant in the 76th foot, from which, in the following month, he exchanged into the 41st, and on the 25th of June 1788 was appointed to the 12th Light Dragoons. On the 30th of June 1791 he became captain in the 58th Foot, and on the 31st of October 1792, obtained in exchange a troop in the 18th Light Dragoons. Captain Wellesley was gazetted as major in the 33rd Foot, April 30, 1793, and of the following September obtained by purchase the rank of lieutenant-colonel of that regiment. Before he commenced his career of active service he was attached as aide-de-camp to the staff of the Earl of Westmoreland, then lord-lieutenant of Ireland, and in 1790, having just come of age, he was returned as a member to the Irish parliament for the family borough of Trim, in the county of Meath.

Lieutenant-Colonel Wellesley, in command of the 33rd regiment, sailed from Cork for Flanders, on his first active service, in May 1794, and landed at Ostend to join the British army under the Duke of York, then in the Netherlands. The advance of the French army under Pichegru obliged the British, after several engagements, to retire into Holland, and take up a position on the right bank of the Waal. In January 1795 the retreat was continued by the town of Deventer, through Gueldersland and Overyssel, to the river Ems, and thence to Bremen, where the army was re-embarked for England in the spring. During this arduous retreat through a frozen and cheerless country, in the middle of a winter remarkably severe, Lieutenant-Colonel Wellesley commanded a brigade in the rear-guard, and his able dispositions in checking or assaulting the enemy are specially noticed in contemporary accounts of the events.

In the autumn of 1795 the 33rd regiment embarked for the West Indies; but the ships, after being tossed at sea for six weeks, were obliged to put back into Portsmouth, and the 33rd regiment was landed again, and in April 1796 was embarked for India. Colonel Wellesley (for he had been promoted to the rank of Colonel in May of that year) was detained at home through illness, but he joined his regiment at the Cape of Good Hope, and proceeded with it to Calcutta, where he arrived in February 1797, and was placed on the Bengal establishment.

In May 1798, the Earl of Mornington, Colonel Wellesley's elder brother, arrived at Calcutta, having been appointed governor-general of India on the 4th of October 1797. One of the first objects that required his attention was the equivocal attitude of Tippoo Saib, sultan of Mysore, towards the English. In the month of June a proclamation of the French governor of the Isle of France announced the arrival of two ambassadors from Tippoo, to propose an alliance offensive and defensive for the purpose of expelling the English from India, in consequence of which a number of Frenchmen volunteered to join the sultan, and were taken to Mangalore in a French ship of war. These movements of Tippoo were connected with the French expedition to Egypt. The Earl of Mornington wrote several conciliatory letters to Tippoo, to induce him to settle any pending controversy between him and the East India Company by means of negociation, but at the same time he did not neglect to prepare for offensive operations, and in November an army was assembled at Vellore, under the command of General Harris, ready to enter the territories of Mysore at the first symptom of hostility. With his regiment, formed part of this force. The army was joined by a large contingent from the Nizam of the Deccan, an ally of the English; and as the court of Hyderabad expressed a wish that the brother of the governor-general should be appointed to the command of the contingent, General Harris ordered the 33rd regiment to be attached to the Nizam's force, the general command of which was given to Colonel Wellesley. As Tippoo declined to enter into negociations, and was evidently trying to gain time, the allied British and native army was ordered to advance into Mysore, which they entered early in March 1799. On the 27th an engagement took place, in which the left wing of the allies, under Colonel Wellesley, routed a body of Tippoo's choice infantry. The army then advanced to Seringapatam, Tippoo's capital, and Colonel Wellesley was employed to dislodge the enemy from a commanding peak in front of the town, which he executed in gallant style, and without loss. The siege of Seringapatam followed, and on the 4th of May the place was stormed by a party under General Baird. After the storming was over, and the confusion began to subside, General Baird desired to be relieved, and Colonel Wellesley was ordered to take the command of the place. By his exertions and firmness he succeeded in stopping the plunder within the town. Tippoo Saib was slain.

In July 1799 Colonel Wellesley was appointed governor of Seringapatam, and the capital of Mysore. During several years that he held almost vice-regal command in Mysore he was fully occupied in organising the civil and military administration of the country, and in the execution of this task he improved his natural talents for business, military and civil, and displayed that quickness of perception and decision of character which have characterised him throughout the whole course of his military career. From the beginning also he paid particular attention to the wants of his soldiers, to the regularity of the supply of provisions, to the management of the hospitals, and to all the particulars of the commissariat and Quartermaster-General's departments, which constitute half the business of an army, and, to use his own words, if neglected, "misfortune and disgrace will be the result." In the mean time also, by his justice and humanity, and the strict discipline that he maintained among the troops, he acquired the confidence and respect of the native population of Seringapatam.

While thus employed in Mysore he was obliged to take the field against one of those bold adventurers, once common in India, named Dhoondia Waugh, who had got together 5000 horsemen, partly from Tippoo's disbanded cavalry, and partly from other predatory bands, and who styled himself 'King of the Two Worlds.' Colonel Wellesley, after a harassing chase of two months, came up with him on the 10th of September 1800, immediately attacked him, and put his army to the rout by a single charge, in resisting which Dhoondia himself was slain. In December of the same year Colonel Wellesley was appointed by the governor-general in council to command a body of about 5000 troops assembled at Trincomalee, in the island of Ceylon, for foreign service, and he accordingly proceeded from Mysore to Trincomalee. The object of the expedition was said to be the conquest of the Isle of France. Meantime dispatches from England arrived, directing 3000 men to be sent to the Red Sea to act against the French in Upper Egypt, whilst an expedition from Europe, under Sir Ralph Abercrombie, was attacking Lower Egypt. The governor of Madras sent Colonel Wellesley a copy of the dispatches from home, and as he knew that his brother, the governor-general, when he ordered the assembling of the force at Trincomalee, had some expectation of its being required for Egypt, Colonel Wellesley, upon his own responsibility, moved at once the whole force to Bombay, where it could be

Digitized by Google

supplied with provisions and other necessaries previous to sailing to the Red Sea, and where he would be ready to receive final orders from the governor-general. He sailed from Trincomalee about the middle of February 1801, and arrived at Bombay about the middle of March. The governor-general had appointed General Baird to command the Egyptian expedition, leaving to his brother the choice of going under him as second in command, or retaining his own command in Mysore. When Lord Mornington learnt that Colonel Wellesley was at Bombay with the whole Trincomalee force, he could not disapprove of this movement, as he had himself intended to send to the Red Sea a larger body of men than that mentioned in the home despatches, but still he thought it ought not to be set up as a precedent, and he required an official explanation of the grounds and motives which had induced his brother thus to act upon his own judgment, without waiting for orders. Colonel Wellesley stated his motives at full length, in a letter, dated Bombay, March 23, 1801. ('Dispatches,' vol. I.) He intended to have proceeded to the Red Sea, and to have served under General Baird; but on the 25th of March he was seized with fever, and soon afterwards returned to his government in Mysore. Before leaving Bombay he transmitted to General Baird a memorandum which he had written concerning the operations in the Red Sea, containing such reflection which he had bestowed on his anticipated command.

Colonel Wellesley made a second stay in Mysore of nearly two years. He was raised to the rank of Major-General in April 1802, and in February 1803 he was appointed to command a force intended to march into the Mahratta territory.

Civil war raged between the Mahratta chiefs Holkar and Scindia. The Peishwa, the nominal head of the Mahratta confederation, was looked upon as an instrument in the hands of the strongest. Dowlut Rao Scindia, who ruled over Malwa and Candeish, had an army of regular infantry and artillery, which had been formed by his father, with the assistance of M. de Boigne, a native of Savoy, and was now under the direction of a French officer of the name of Perron. Scindia exercised paramount influence over the Peishwa at Poonah. Holkar, another ambitious chieftain, who had long been at variance with Scindia, suddenly crossed the Nerbudda and marched with a large cavalry force on Poonah, which he entered after defeating the combined army of Scindia and the Peishwa. The Peishwa escaped to the coast, and put himself under British protection, whilst Holkar placed one of his relations on the seat of power at Poonah.

The Madras army, under Lieutenant-General Stuart, was ordered to advance into the Mahratta territory for the purpose of reinstating the Peishwa, and Major-General Wellesley was appointed to command a select corps in advance, with which he marched by way of Poonah. Having received information on the road that Holkar's people intended to burn the town on his approach, he moved on with the cavalry, and, performing a march of 60 miles in 30 hours, reached Poonah on the 20th of April, and thus saved the town. Holkar's people retired without fighting, and in the following month the Peishwa re-entered his capital. Scindia however and the Raja of Berar, another powerful Mahratta chief, were together in the field making hostile demonstrations against the English and their ally the Nizam, and they were understood to be in correspondence with Holkar, who was to join the league. Seeing this state of affairs, which was yet more dangerous at a moment when by the peace of Amiens the French had just recovered their Indian possessions, the governor-general appointed General Wellesley to the chief command of all the British and allied troops serving in the territories of the Peishwa and of the Nizam, with full power to direct all the political affairs of the British government in the same district. ('Dispatches,' Fort William, 26th and 27th of June, vol. II.) The force at his command consisted of about 18,000 troops of all arms, Europeans and natives, including the 19th Dragoons and the 74th Foot. After some fruitless negociations with Scindia, General Wellesley marched from Poonah to the north, and took by escalade the town of Ahmednugur, which was garrisoned by Scindia's troops. On the 24th of August he crossed the river Godavery, and entered Aurungabad on the 29th. The enemy manifested an intention to cross the river to the eastward and steal a march upon Hyderabad, but were prevented by General Wellesley marching along the left bank of the river, and placing himself between them and that city. On the 12th of September the British army, which was encamped 20 miles north of the Godavery. Colonel Stevenson, with the Nizam's auxiliary force, was at some distance from him. Scindia, who had a large mass of irregular cavalry, avoided a general engagement, being strong in British discipline, and only thought of carrying on a predatory warfare.

About the middle of September, General Wellesley learnt that Scindia had been reinforced by 16 battalions of infantry commanded by French officers, and a large train of artillery, and that the whole of his force was assembled near the banks of the small river Kaitna. On the 21st of September General Wellesley had a conference with Colonel Stevenson, in which a general plan of attack on the enemy was concerted. The General and the Colonel advanced by two parallel routes round the hills, so as to fall at the same time upon the enemy. General Wellesley on the 23rd received a report that Scindia and the Rajah of Berar had moved off in the morning with their cavalry, and that the infantry were about to follow, but were still in camp at the distance of about six miles. General Wellesley determined to march upon the infantry, and engage it at once. He sent a messenger to Colonel Stevenson, then about eight miles on his left, to inform him of his intention, and directing his advance. He moved forward with the 19th Light Dragoons and three regiments of native cavalry to reconnoitre. The infantry, consisting of two British and five native battalions, followed. After a march of about four miles he saw from an elevated plain not only the infantry, but the whole Mahratta force, consisting of nearly 50,000 men, encamped on the north side of the river Kaitna; the right, consisting of cavalry, was about Bokerdou, and extended to their corps of infantry, which was encamped near the village of Assaye, with 90 pieces of artillery. General Wellesley determined on attacking the infantry on its left and rear. He moved his little army to a ford beyond the enemy's left, and, leaving the Mysore and other irregular cavalry to watch that of the enemy, he crossed the river with his regular horse and infantry, and having ascended the bank, which was steep, formed his men in three lines, two of infantry and the third of cavalry. This was effected under a brisk cannonade from the enemy's guns. Scindia at the same time made a corresponding movement in his line, by giving a new front to his infantry, which was made to rest its right upon the river Kaitna, and its left upon the village of Assaye and the Juah stream. His numerous and well-served cannon did fearful execution among the British advancing lines. General Wellesley, seeing this, gave orders to abandon the artillery, and for the infantry to charge with the bayonet. The charge proved irresistible on the right and centre of the line; the British took possession of the guns, and the enemy's infantry gave way. But the British right suffered a very severe loss from the guns at the village of Assaye, and the enemy's cavalry, seeing the gaps thus made in the ranks, charged the 74th regiment, when Colonel Maxwell, with the 19th Dragoons, came to its rescue, and drove back the assailants with great loss. The native infantry in the British service proceeding too far in the pursuit, many of the enemy's artillerymen, who had thrown themselves down among the carriages of their guns, as if they were dead, turned their pieces against the unsuspecting line of infantry, and at the same time several of Scindia's battalions formed themselves again, thus placing the sepoys between two fires. Colonel Maxwell charged and dispersed those battalions, but he lost his life. The 78th British regiment, which was on the left of the line, remained firm with unbroken ranks in the midst of the confusion. It had contributed greatly to the victory. General Wellesley led the regiment in person against the village of Assaye, where the enemy made the stoutest resistance, but at last gave way. It was near dark when the firing ceased. The enemy retired in great disorder, leaving in the hands of the whole of his artillery, ammunition, and stores. Colonel Stevenson arrived on the field after the battle, and undertook the pursuit. The loss of the united army, British and native, in this splendid victory consisted of 22 officers and 386 men killed, and 57 officers and 1526 men wounded, in all nearly one-third of the force engaged, exclusive of the irregular cavalry. The enemy left more than 1200 dead and a great number of wounded on the field of battle. General Wellesley had two horses killed under him, and his orderly's head was torn away by a cannon-ball as he rode beside him.

While General Wellesley was defeating the Mahrattas in the south, General Lake gained a complete victory at Allyghur, in the plains of Hindustan, over another part of their force under M. Perron, which had occupied Delhi. The Mahratta power was now broken, and after several marches and countermarches, and desultory negociations, which were asked and obtained a truce at the beginning of November, but the Raja of Berar still kept the field, and General Wellesley, coming up with him in the plains of Argaum, found Scindia's cavalry, together with the Raja's forces, drawn up in battle array. The battle of Argaum was fought November 29, 1803. The British line advanced in the best order. The 74th and 78th regiments were attacked by a large body of Persian mercenaries in the service of the Raja of Berar, which was entirely destroyed. Scindia's cavalry charged one of the Company's regiments, and was repulsed, when the whole Mahratta army retired in disorder, leaving 38 pieces of cannon and their ammunition in the hands of the British. The British cavalry pursued the enemy for several miles, taking many elephants, camels, and much baggage. Colonel Stevenson soon after took by storm the strong fort of Gawilghur, and this exploit completed the conquest. The Raja of Berar now sued for peace, and General Wellesley drew up the conditions of the treaty, by which the Raja ceded to the Company the province of Cuttack with the district of Balasore, and dismissed his European officers. Scindia was glad to follow the example, and on the 30th of December he signed a treaty of peace, by which he ceded to the Company all the country between the Jumna and the Ganges, besides numerous forts. In February 1804, General Wellesley crossed the Godavery to put down the independent freebooting parties which were carrying devastation through the West Deccan. Following them rapidly from hill to hill, he gradually dispersed them, and took their guns, ammunition, and baggage. Peace was thus restored to the peninsula of India.

In March 1804, General Wellesley paid a visit to Bombay, where he was received with marked honour and loud acclamations, and an address of the British inhabitants of Bombay was presented to him, as a commander "equally great in the cabinet as in the field." The

Digitized by Google

British inhabitants of Calcutta voted him a sword of the value of 1000*l.*, and the officers of the army of the Deccan presented him with a service of plate of the value of 2000 guineas, with the inscription, "Battle of Assaye, September 23, 1803."

On the 24th of June 1804, General Wellesley broke up the army in the Deccan, in pursuance of orders from the governor-general, and the following month he returned to Seringapatam, where he received from the native inhabitants an affecting address, in which they "implored the God of all castes and all nations to hear their constant prayer, whenever greater affairs might call him away from them, to bestow on him health, glory, and happiness." ('Dispatches,' vol. iii., p. 420.) It may be here observed that during the whole of his career in India, as afterwards in the Spanish peninsula, General Wellesley, ever ready and just, showed himself always inclined to humanity and mercy whenever they could be exercised without detriment to justice or to the safety of others; and of this humane disposition his 'Dispatches' contain numerous instances.

In July 1804, General Wellesley was called to Calcutta to assist in military deliberations. Several important memoranda on the political and military affairs of India, which are given in the third volume of the 'Dispatches,' were written by him about this period. In November of the same year he left Calcutta for Madras, whence he returned to Seringapatam. In February 1805 he again repaired to Madras, and obtained leave to return to England. About the same time his appointment by the king to be a knight Companion of the Order of the Bath was known in India, and published in the general orders; and in the following March the thanks of both Houses of Parliament to Major-General Wellesley, for his services, were likewise published in the general orders in India. On the 10th of March 1805 Sir Arthur Wellesley sailed from Madras for England.

General Sir Arthur Wellesley landed in England in September 1805. In November of the same year he was sent to Hanover in command of a brigade in the expedition under Lord Cathcart, which was intended to make a diversion whilst the French army was engaged on the banks of the Danube against Austria and Russia. The temporization of the Prussian cabinet, and the disastrous battle of Austerlitz (December 1805), disconcerted the plans of the allies, and the English returned from Hanover to England in February 1806, without having seen any active service. Sir Arthur Wellesley was now appointed to the command of a brigade of infantry stationed at Hastings. In January 1806, when the news was received of the death of the Marquis of Cornwallis he was appointed Colonel of the 33rd regiment. On the 10th of April 1806, he married Lady Catherine Pakenham, third daughter of the Earl of Longford. In that year he was elected member for the borough of Rye, and from his seat in the House of Commons he defended the administration of his brother the Marquis of Wellesley in India. In April 1807 Sir Arthur Wellesley was appointed secretary for Ireland, the Duke of Richmond being lord lieutenant of Ireland, and in that capacity was sworn a member of his Majesty's Privy Council. In August of the same year he was appointed to a command in the expedition sent to Copenhagen, under Lord Cathcart and Admiral Gambier. On the 29th of August General Wellesley's division attacked the Danish troops at Kioge, carried their entrenchments, and entered the town of Kioge, where they took a large military store and nearly 1200 prisoners. This was the only action of any importance which took place by land. The bombardment of Copenhagen having induced the Crown Prince of Denmark to listen to terms, General Wellesley was appointed by Lord Cathcart, together with Lieutenant-Colonel Murray and Sir Home Popham, captain of the fleet, to draw up the articles of the capitulation, which were agreed to by the Danish government on the 7th of September, and by which the Danish fleet and naval stores were delivered to the British government till the general peace. General Wellesley returned to England with the expedition, and resumed his duties as secretary for Ireland. In the following February (1808) he received in his place in the House of Commons, the thanks of that body for his important share in the events of the Copenhagen expedition, by which Napoleon was deprived of the assistance of the Danish fleet, upon which he had reckoned to his plans against England.

In the spring of 1808 a military force was assembled at Cork, intended, it was believed, to act against the Spanish colonies of South America, Spain being, through French influence, at war with England. But the invasion of Portugal and Spain by Napoleon, occurring about the same time, gave a new destination to the English expedition. The people of Spain declared against the invaders, and sent to England to ask for assistance. Juntas, or local governments, were formed, and peace was proclaimed between Spain and England. The main strength of the Spanish patriots appeared to be in the north, in the mountainous provinces of Asturias and Galicia, which were as yet untouched by the French, and the deputies who came to England from those provinces requested the employment of an English auxiliary force to effect a diversion by landing on some point of the coast of Portugal. Sir Arthur Wellesley, who had been promoted to the rank of Lieutenant-General, April 25, 1808, was appointed in the following June to the command of the force intended for the Peninsula, consisting of about 9000 infantry and a regiment of light dragoons, with the promise of an additional force of 10,000 men to follow in a short time. These formed altogether a respectable military force, but the importance of the occasion warranted exertions even greater than these, for the Spanish peninsula had now become the field on which the great question was to be decided whether France was to govern Europe, and dictate to all other states, Great Britain included.

Sir Arthur Wellesley landed at Coruña July 20, 1808. The junta of Galicia asked for nothing but arms and money. They declined the assistance of a British auxiliary force, but they advised General Wellesley to land in Portugal, to rescue that kingdom from the French grasp, and thus to open a ready communication between the north and south of Spain. This was in accordance with Sir Arthur Wellesley's own views, and the general instructions that he had from home. He accordingly sailed on to Oporto, which town had already risen against the French power, and there he found the bishop, who was at the head of the insurrection, and had gathered together about 3000 men indifferently armed and equipped. He also learned that 5000 Portuguese regular troops were stationed at Coimbra, on the Mondego. Having made arrangements with the bishop for the supply of mules and horses, General Wellesley sailed to the south as far as the Tagus to get fresh information as to the strength and position of the French troops near Lisbon. On the 30th of July, he anchored in Mondego Bay, which he fixed upon for the landing of the expedition. The landing took place on the 1st of August, near the small town of Figueira, on the south bank of the Mondego. The number of troops landed was about 9000. On the 5th Major-General Spencer joined him from Cadiz with about 4000 more.

The whole British force in Portugal at this time, under Junot, consisted of 16,000 or 18,000 men, from which deducting the garrisons of Almeida, Elvas, Peniche, Setubal, and other places, there remained about 14,000 men for the defence of Lisbon. Their communications were cut off from their countrymen in Spain, for, since the surrender of General Dupont, the Spanish patriots were masters of Andalucia and Estremadura, and in Old Castile the French troops under Bessières had not advanced westward further than Benavente, being observed by the Spanish army of Galicia. About the same time the French abandoned Madrid and retired to the Ebro. A clear stage therefore was left for the coutest in Portugal between Wellesley and Junot, whose respective disposable forces were nearly equal, the French however having the advantage of a considerable body of cavalry.

On the 10th of August the English began their march southward. The advanced guard entered the town of Leiria on the 10th, where it found the Portuguese force of 5000 men under General Freire, who, having appropriated to the wants of his men the stores which, by an agreement between the junta of Oporto and Sir Arthur Wellesley, were intended for the English, further demanded that his corps should henceforth be furnished with provisions by the English commissariat, a preposterous request, with which General Wellesley declined to comply. Freire then refused to advance with the English, and remained behind at Leiria, and it was with difficulty prevailed upon to allow about 1600 of his men to join Sir Arthur. On the 14th the English entered Alcobaça, and on the 15th Caldas, following the road to Torres Vedras, which runs parallel to the sea-coast. It was near Roliça, about ten miles beyond Caldas, that the first engagement took place. But before relating the operations of the campaign, it will be convenient to describe the position of the French in Portugal.

When the Spaniards had risen against the invaders, the spirit of resistance spread to Portugal, the natives of which country had equal motives for being dissatisfied with the French rule. Junot had left with their army several Spanish regiments, which were scattered about the country in the several garisons. The Spanish troops which were at Oporto, forming the principal part of that garrison, hearing of the news from Spain, revolted against the French commander, seized him, together with the few French soldiers who were with him, and set off with their prisoners for Spain, leaving the Portuguese at liberty to act as they pleased. A junta was then formed, with the bishop at their head, in the name of the Prince Regent of Portugal, and the whole of the Spanish troops north of the Douro rose against the French. The insurrection spread southward into Beira. In the south the people of Algarve rose, and those of Alemtejo followed their example, being supported by a body of Spanish troops. The town of Evora became the centre of the insurrection in that quarter. The French General Loison, who had been sent to repress the insurgents in the north, was quickly recalled by Junot, and sent into Alemtejo. He entered Evora after a desperate resistance on the part of the inhabitants, and the town was given up to indiscriminate massacre. General Margeron executed like vengeance at Leiria, sparing neither age nor sex. Similar scenes took place at Guarda in the north, and at Beja and Villaviçosa in the south. In these butcheries however the French were also losing their own men daily, for the peasantry were always hovering about their line of march, ready to cut off stragglers and intercept the communications. "The whole kingdom," observed Sir Arthur Wellesley in one of his first dispatches after landing in Mondego Bay, "with the exception of the neighbourhood of Lisbon, is in a state of insurrection against the French. Their means of resistance are however less powerful than those of the Spaniards. The French troops have been completely dispersed, their officers have gone off to Brazil, and their arsenals are pillaged or in the power of the enemy. Their revolt, under the circumstances in which it has taken place, is still more extraordinary than that of the Spanish nation. They have in the

Digitized by Google

northern part of the kingdom about 10,000 men in arms, of which number 5000 are to march with me towards Lisbon, the remainder are employed in a distant blockade of Almeida, and in the protection of Oporto, which is now the seat of the government. The insurrection is general throughout Alemtejo and Algerve to the southward, and in Entre Douro e Minho, Tras-os-Montes, and Beira, to the northward; but for want of arms the people can do nothing against the enemy."

The French commander-in-chief, Junot, on the news of the landing of the English, determined to abandon the provinces, except the fortresses of Elvas and Almeida, and to collect his force in the neighbourhood of Lisbon. He sent a division of about 5000 men, under De Laborde, towards Leiria, to keep the English in check; and he ordered Loison, who had returned from his expedition into Alemtejo, and had crossed the Tagus at Abrantes, to join De Laborde secretly. But the rapid advance of the English obliged De Laborde to fall back before he could be joined by Loison, and now De Laborde determined to make a stand alone in the favourable position of Roliça, hoping every moment to see Loison appear on his right.

General Wellesley, having driven the enemy's pickets from Obidas, marched on the 17th of August to attack De Laborde. He formed his army into three columns: the right, consisting of Portuguese, was ordered to make a demonstration on the enemy's left; the left to ascend the hills on the enemy's right, and thus watch the approach of Loison; and the centre, which was the column of attack, to march along the valley to the front of De Laborde's position. The French, after a gallant defence, were obliged to retire, which they did in good order, being protected by their cavalry. They withdrew to the Torres Vedras, where they were joined by Loison's corps. The loss of the French in the engagement at Roliça was supposed to be above 600 killed and wounded, besides three pieces of cannon; that of the British was 480. It must be observed here, once for all, that the losses of the French throughout this war are never accurately known, as they published no returns, whilst the British official returns of killed, wounded, and prisoners, made by the respective officers in command of regiments after a battle, were always published in the 'Gazette.'

On the 18th of August General Wellesley advanced to Lourinha, keeping along the coast-road leading to Mafra. On the 19th he moved to Vimiero, where he was joined the next day by Generals Anstruther and Ackland, with two brigades just arrived off the coast from England, and which raised his force to about 17,000 British, besides 1500 Portuguese. At the same time however General Wellesley was superseded in the chief command by Lieutenant-General Sir Harry Burrard, who arrived from England. The government at home had determined, in consequence of the pacific appearance of affairs in the Peninsula, to have there an army of 30,000 British troops, and with that view they ordered the corps of Lieutenant-General Sir John Moore, which had just returned from a fruitless expedition to the Baltic, to proceed to Portugal; and they gave the chief command of the army to Lieutenant-General Sir Hew Dalrymple, governor of Gibraltar, while Sir Harry Burrard under him as second in command; and Lieutenant-Generals Sir John Moore, Sir Arthur Wellesley, the Hon. John Hope, Lord Paget, and Mackenzie Fraser, to command respectively divisions of the army.

Sir Harry Burrard arrived in a frigate in Maceira Bay, near Vimiero, on the evening of the 20th, and General Wellesley immediately went on board, and reported to him the situation of the army, and his own intended plan of operations, which was to march along the coast-road to Mafra, and thus turn the strong position which De Laborde and Loison had taken at Torres Vedras. By this means he would oblige the French either to give battle or retreat to Lisbon under great disadvantages. Sir Harry Burrard however decided not to advance any farther till the arrival of the reinforcements under Sir John Moore. But the enemy in the meantime was bringing the question to a speedy issue.

Junot, having joined De Laborde and Loison at Torres Vedras with all his force, estimated at about 14,000 men, of whom 1600 were cavalry, attacked the English in the position of Vimiero early in the morning of the 21st of August. The principal attack was made upon the British centre and left, with a view, according to a favourite French expression in those times, of driving the English into the sea, which was close in their rear. The attack was made with great bravery and steadiness, but was as gallantly resisted by the British; it was repeated by General Kellerman at the head of the French reserve, which was also repulsed; and the French, being charged with the bayonet, withdrew on all points in confusion, leaving many prisoners, among them a general officer, and 14 cannon, with ammunition, &c., in the hands of the British. The loss of the French in killed and wounded was estimated at about 1800, and that of the British was 720. Sir Harry Burrard landed, and was present on the field during part of the engagement, but he declined assuming the command, or in any way interfering with General Wellesley's dispositions, till the enemy was repulsed. Towards the close of the action, when the French were seen retiring in confusion, General Wellesley wished to follow up his victory; General Ferguson on the left was actually close upon the retreating enemy, and if General Hill and the advanced guard had marched straight upon Torres Vedras they would have reached it before the French, who would thus have been cut off from

Lisbon, and perhaps obliged to lay down their arms. Such was Sir Arthur's view; but Sir Harry Burrard thought it advisable not to move any farther, especially on account of the superiority of the enemy's cavalry. General Ferguson was ordered to desist from pursuit, and the French officers were thus enabled to rally their men, and make good their retreat to Torres Vedras.

On the 22nd of August Sir Hew Dalrymple, the commander-in-chief, landed in Maceira Bay, and assumed the command. In the course of the day General Kellerman appeared with a flag of truce on the part of Junot to propose an armistice, preparatory to entering upon a convention for the evacuation of Portugal by the French. The terms were discussed between General Kellerman and Sir Hew Dalrymple, who in the end directed General Wellesley to sign the articles of convention. Among the articles was one which prejudged the terms of the final convention by stipulating that the French army should not "in any case" be considered as prisoners of war, and that all the individuals composing it should be carried to France with their baggage, and "their private property of every description, from which nothing should be detained!" This, of course, would include the church plate and other public and private property which the French had taken either at Lisbon or in the various towns which they had sacked in consequence of the insurrection, and which they had divided among themselves. General Wellesley did not "entirely approve of the manner in which the instrument was worded;" but the articles, being laid before the commander-in-chief, were signed by him that same evening. The armistice however was made subject to the approbation of the Admiral, Sir Charles Cotton; and as one article of it stipulated that the Russian fleet in the Tagus, under Admiral Siniavin, should enjoy all the advantages of a neutral port, Sir Charles objected to this, but offered to enter into a separate arrangement with the Russian admiral. On the 25th Sir Hew Dalrymple signified to Junot that the armistice would be done at end on the 28th, as soon, unless a convention for the evacuation of Portugal by the French should be agreed upon before that day. In the meantime the army had made a forward movement from Vimiero to Ramalhal, near Torres Vedras, within the boundaries stipulated by the armistice. Sir John Moore had also arrived in Maceira Bay, and his troops were about being landed. Junot, now perceiving the necessity of coming to terms, commissioned General Kellerman to confer with Colonel Murray, quartermaster-general to the British army, about the final convention. The favourable moment for negotiating upon this footing was now past; and if they could not be brought to evacuate the country by sea, they might either defend themselves within Lisbon, or cross the Tagus to Elvas, which, being a place regularly fortified, would have required a long siege, during which the British army could not have been made available in Spain. ('Dispatches,' iv., 1.) On the 26th General Wellesley landed to Sir Hew Dalrymple a memorandum for Colonel Murray, suggesting, among other things, a separate agreement with the Russian admiral, and the propriety of devising some mode to make the French give up the church plate which they had seized. On the 30th the draft of the proposed convention was brought to the British headquarters at Torres Vedras, and, being laid before a meeting of general officers, several alterations were made, and the form so altered was returned to Junot, and was at last signed by him on the 30th, with the omission of several of the alterations, and was ratified by Sir Hew Dalrymple on the 31st. Sir Arthur Wellesley was not present at the final ratification, being then at Sobral with his division. This document has become known by the name of the Convention of Cintra, though it was arranged at Lisbon and finally signed at Torres Vedras. The article which gave most offence was that by which the French, under the name of baggage, were allowed to carry off much of the plunder of Portugal. Some limits however were put to this abuse by a commission being appointed, with General Bereseford at the head, to superintend the strict execution of the terms of the convention. Through the exertions of the commissioners the spoils of the Museum and the Royal Library were restored, together with the money taken from the public treasury. With regard to the Russian fleet, it was agreed that the ships should be held as a pledge by Great Britain during the war, and that the crews should be conveyed home in British ships.

The French embarked in the month of September, and the British troops took possession of the forts of Lisbon in the name of the Prince Regent of Portugal. The whole country being now free from the enemy, a council of regency was appointed, of which the active Bishop of Oporto was a member. The joy of the Portuguese in general was manifested in the most unequivocal manner. But in England the terms of the convention were the subject of severe and loud censure, and the government appointed a board of inquiry to examine into the matter. Sir Hew Dalrymple and Sir Harry Burrard were recalled in order to be examined by the board, as well as Sir Arthur Wellesley, who had already asked and obtained leave to return to England. The court sat in the month of November, and, after a long examination, reported that, the Convention of Cintra having been productive of great advantages to Portugal, to the army and navy, and to the general service, the court was of opinion that no further military proceeding was necessary on the subject, "because, however some of us may differ in our sentiments respecting the fitness of the convention in the relative situation of the two armies, it is our unanimous decla-

Digitized by Google

ration that unquestionable zeal and firmness appear throughout to have been exhibited by Lieutenant-Generals Sir Hew Dalrymple, Sir Harry Burrard, and Sir Arthur Wellesley, as well as that the ardour and gallantry of the rest of the officers and soldiers on every occasion during this expedition have done honour to the troops and reflected lustre on your Majesty's arms." The king adopted the opinion of the board.

Sir Arthur Wellesley's employment in the Peninsula being now terminated, he resumed the duties of his office as Chief Secretary for Ireland, whither he proceeded in the month of December. Parliament having re-assembled in January 1809, he returned to London to resume his seat in the House of Commons. On the 27th of January he received, through the Speaker, the thanks of the House for his distinguished services in Portugal; and, a few days afterwards, the House of Lords passed resolutions to the same effect, which were communicated to Sir Arthur by the Lord Chancellor.

Campaign of 1809.—Napoleon, with an army of more than 200,000 men, having burst through the Spanish lines, and routed the troops, forced in person the strong pass of the Somosierra on the 30th of November 1808, and four days afterwards was in possession of Madrid. Meantime, Soult, with an overwhelming force, had been sent against Sir John Moore, who had advanced into Spain as far as Salamanca. This movement was followed by the disastrous retreat of the small army under Sir John Moore, the battle of Coruña, January 16, 1809, in which the brave commander was slain, and the embarkation of the British forces for England. The French, following up their success, spread over Leon and Estremadura to the borders of Portugal, and Soult, having overran Galicia, marched into the northern Portuguese provinces, and carried Oporto by storm against the native troops. The small British force which had been left in Portugal when Sir John Moore advanced into Spain was concentrated by General Sir John Cradock for the defence of Lisbon. The unfavourable turn of affairs in Spain induced the British government to make another effort to save Portugal from invasion, and at the same time to assist the Spaniards in their momentous struggle. Sir Arthur Wellesley, having previously resigned his office of Secretary for Ireland as well as his seat in parliament, was sent to Portugal to assume the chief command of the British forces in the Peninsula. He arrived at Lisbon April 22, 1809, with his staff. He was followed by reinforcements of infantry and several regiments of cavalry. These, together with the Portuguese regulars under General Beresford, whom the Prince Regent had appointed to the chief command of his army, enabled him to bring into the field a force of about 25,000 men, with which he resolved at the end of April to dislodge Soult from Oporto, leaving a division under General Mackenzie on the Tagus to guard the eastern frontiers of Portugal against the French General Victor, who was stationed near Merida, in Spanish Estremadura. The army under General Wellesley, having assembled at Coimbra, moved on the 9th of May in the direction of Oporto, and drove back the French troops, which had advanced south of the Douro. On the 11th of May the English occupied the southern bank of that river opposite the city of Oporto. The French had destroyed the bridge and removed the boats to their own side, and Soult was preparing to retire leisurely by the road to Galicia.

General Wellesley sent a brigade under General Murray to pass the river about four miles above Oporto, while the brigade of Guards was directed to cross the river at the suburb of Villanova, and the main body under the commander-in-chief was to attempt a passage in the centre by means of any boats that they could find. The Douro at that spot is very rapid, and nearly three hundred yards wide. About ten o'clock in the morning of the 12th of May, two boats having been discovered, Colonel Paget with three companies of the Buffs crossed the river, and got possession of an unfinished building on the Oporto side, called the Seminario. The French in Oporto were taken by surprise. They sounded the alarm, and marched out to attack the Seminario, but, before they could dislodge the first party that had landed, General Hill crossed with fresh troops, and, protected by the British artillery from the southern bank, maintained the contest with great gallantry, until General Sherbrooke with the Guards crossed lower down into the very town of Oporto, amidst the acclamations of the inhabitants, and charged the French through the streets. Meantime the head of Murray's column, which had crossed at Avintas, making its appearance, Soult ordered an immediate retreat, which was effected in the greatest confusion. He left behind his sick and wounded and many prisoners, besides artillery and ammunition, and retired by Amarante with the view of passing into Spain through Traz-os-Moutes; but finding that Loison had abandoned the bridge of Amarante, which was taken possession of by the Portuguese, he marched by Guimaraens, Braga, Salamonde, and Montealegre, into Galicia. In this disastrous retreat the French were obliged to destroy the remainder of their artillery and part of their baggage, and the road was strewed with dead horses and mules, and French soldiers, many of whom were put to death by the peasantry before the advanced guard of the British could save them.

Soult lost about one-fourth of his army, but the retreat was effected with great ability under the most unfavourable circumstances. General Wellesley pursued the French as far as Montealegre, and, having driven them out of Portugal, retraced his steps to the south. The passage of the broad and rapid Douro, effected in broad day, in presence of a French marshal at the head of 10,000 veterans, was one of Wellington's finest achievements. The English lost at the attack of Oporto only 23 killed and 98 wounded.

On taking possession of Oporto, General Wellesley issued a proclamation, strictly enjoining the inhabitants to respect the French wounded and prisoners, and he wrote to Marshal Soult to request him to send some French medical officers to take care of their sick and wounded, as he did not wish to trust them to the Portuguese.

The attention of Sir Arthur Wellesley was now turned towards Spain. It was necessary to strike a blow in that country, and the present occasion appeared favourable. The condition of the national cause of Spain had improved since Napoleon had left that country in January. None of his generals had individually the same means that he had at his disposal, and there was not a sufficient bond of union among them all to make them act in concert. Each had a separate command over a large division of the country, and was in a great measure independent of the others, and Joseph Bonaparte, who had been established in Madrid as king of Spain, had little or no control over them, and had not himself sufficient military skill to direct their movements. Each marshal therefore, and there were five or six in the Peninsula, acted by himself, and the warfare became complicated and irregular. Marshal Victor, Duke of Belluno, commanded the first corps in Estremadura, near the borders of Portugal, having about 35,000 men, of whom however only 25,000 were under arms. General Sebastiani commanded the fourth corps in La Mancha, which numbered about 20,000 men under arms. A division of reserve under Desolles stationed at Madrid, together with King Joseph's guards, amounted to about 15,000 men. Kellerman's and Bonnet's divisions, stationed in Old Castile and on the borders of Leon and Asturias, comprised about 10,000 more. All the above troops, amounting to about 60,000 disposable men, were considered to be immediately under King Joseph for the protection of Madrid and of Central Spain, and also to act offensively in Andalucia and against Portugal by the Tagus and the Guadiana. Soult had a distinct command. He had mainly to occupy the northern provinces of Spain, and to act through them against Portugal. He had under his immediate orders the second corps, mustering about 20,000 men under arms; the fifth, or Mortier's corps, amounting to 16,000; and Ney, with the sixth corps, also about 16,000. The French force in all was about 52,000 men in the field. These were the two French armies with which the English advancing from Portugal were likely to be brought into collision. Besides these there were in eastern Spain the third and seventh corps, making together about 50,000 men, under Suchet and Augereau, who were pretty fully employed in Aragon and Catalufia; and 35,000 more were scattered in the various garrisons and lines of communication.

The fortresses and fortified towns in the hands of the French were —1st, on the northern line, San Sebastian, Pamplona, Bilbao, Santona, Santander, Burgos, Leon, and Astorga; 2nd, on the central line, Jaca, Zaragoza, Guadalajara, Toledo, Segovia, and Zamora; 3rd, Figueras, Rosas, and Barcelona, on the eastern coast. But Soult, after being driven out of northern Portugal, had withdrawn from Galicia; and Ney, having the same movement to accomplish, only evacuated the extensive provinces, including the forts of Coruña and Ferrol. A misunderstanding or disagreement between those two commanders led to the deliverance of Galicia, which was an important event in the war, for the French never regained that part of Spain.

Marshal Soult reached Zamora in the beginning of July, and hovered about the eastern frontiers of Portugal. Ney arrived at Astorga. Victor was posted between the Tagus and the Guadiana, his troops suffering much from malaria. Mortier, with the fifth corps, on the road from Zaragoza to Valladolid, received

on the 8th. Cuesta crossed the Tagus by the bridge of Almaraz, and the two armies made their junction on the 10th. Sir Robert Wilson, with the Lusitanian Legion, one Portuguese and two Spanish battalions, moved on to Escalona, about eight leagues from Madrid, threating the rear of Victor's army, which was posted at Talavera de la Reyna. On the 22nd the combined Spanish and British armies attacked Victor's outposts at Talavera, and drove them in. The enemy would have suffered more if General Cuesta had not been absent from the field. The British columns were formed for the attack of the French position on the 23rd, as General Wellesley wished to attack Victor before Sebastiani, who was posted at Illescas, "contrived to lose the whole of the day, owing to the whimsical perverseness of his disposition."—(Dispatch to J. H. Frere, 24th of July, vol. iv., p. 526.) On the morning of the 24th Victor retired across the Alberche to St. Olalla on the Madrid road, and thence to Torrijos, where he was joined by Sebastiani's corps, and soon after by King Joseph in person, attended by Marshal Jourdan with the Guards and the garrison of Madrid. General Cuesta, who now seemed eager for battle, although General Wellesley recommended him to be very cautious in his movements, followed Victor to St. Olalla, and pushed his advanced guard to Torrijos, when the French attacked him briskly on the 26th, and obliged him to fall back upon the British, on the Alberche. On the 27th General Wellesley, expecting to be attacked, took up his ground in the position of Talavera.

The position of the English army was daily becoming more critical, for Soult was rapidly advancing from Salamanca, by the Puerto de Baños, upon Plasencia, in the rear of the British. General Wellesley had charged Cuesta to guard the mountain-pass of Puerto de Baños, but the Spanish general sent only 600 men thither, a force which of course proved insufficient to arrest Soult's march. General Wellesley did not know that Ney had unexpectedly evacuated Galicia, and was also advancing from Astorga upon the British left. Mortier also, with the 5th corps, was at Valladolid, ready to move upon Madrid, so that there were more than 50,000 fighting men of the enemy behind the mountains of Plasencia, ready to act on the left flank and rear of the British, who had besides 50,000 more in front of them. The British force in the field did not exceed 20,000. There were a few more battalions on their march from Lisbon to join General Craufurd, but they did not arrive till after the battle. The Spanish army of Cuesta mustered about 34,000 men, such as they were. The Portuguese regular troops, under Bernsford, had remained to guard the north-east frontier of Portugal, towards Alcantara. It had been proposed, in order to unite between General Wellesley, Cuesta, and the Spanish Supreme Junta, or Central Government, that General Venegas, who was at the head of the Spanish army of Andalucia, consisting of about 25,000 men, should march through La Mancha upon Madrid, whilst Wellesley and Cuesta were advancing by the valley of the Tagus. Venegas, in his advance through La Mancha, but it seems that he received counter-orders from the Supreme Junta which had the effect of slackening his march; he however made his appearance at last towards Aranjuez and Toledo, and it was his approach on that side which induced King Joseph to engage Wellesley and Cuesta, in order to save his capital. If he had kept the Allies in check for a few days longer, Soult's arrival at Plasencia would have obliged the English to retire precipitately. But King Joseph fearing that Venegas from the south, and Sir Robert Wilson, who, with the Lusitanian Legion, was hovering in the rear, by bombood on the north, would enter Madrid and seize the stores, reserves, &c., he and Marshal Victor determined to give battle to the Allies in front: for if they were defeated, Madrid could be easily protected. General Wellesley, perceiving from the movements of the enemy, that a battle was at hand, with much difficulty prevailed upon Cuesta to fall back with him upon the position of Talavera, where there was good ground for defence. He placed the Spanish army on the right near the Tagus, before the town of Talavera, its front protected by redoubts, ditches, mud walls, and felled trees. In this position they could hardly be seriously attacked. The British infantry on whom the general could depend, occupied the left of the line, which was open in front, but its extreme left rested upon a steep hill, which was the key of the whole position. The whole line extended in length about two miles.

On the 27th of July the French moved from St. Olalla, crossed the river Alberche, drove in the British outposts, and attacked two advanced brigades of the English, which fell back steadily across the plain into their assigned position in the line. Victor now attacked the British left, whilst the 4th corps made a demonstration against the Spaniards on the right, several thousands of whom, after discharging their pieces, fled panic-struck to the rear, followed by their artillery, and creating the greatest confusion among the baggage-retainers and mules, &c.; and it was with difficulty that Generals Wellesley and Cuesta prevented the rest of the Spanish troops from following the example. Luckily the position of the Spanish army was strong in front, and the French, not knowing exactly what was going on, made no further attack on that side; their efforts were directed against the British left, which they succeeded for a moment in turning, and they gained the summit of the hill; but General Hill, being ordered to that point with more troops, drove the French down after an obstinate struggle which lasted till after dark, and in which the

French lost about 1000 men and the British 800. Next morning, the 28th, the French renewed the attack on the hill on the British left, and were again repulsed after losing about 1500 men. After a pause of some hours the attack was renewed upon the whole British front. Heavy columns of French infantry of Sebastiani's corps twice attacked the British right under General Campbell, which joined the Spanish army, but were each time repulsed by the steady fire of the English; a Spanish cavalry regiment charging on their flank at the same time, they retired in disorder, after losing a number of men and 10 guns. In the mean time a French division, supported by two regiments of cavalry, again advanced to turn the British left, and the cavalry fight occurred in which the 23rd Light Dragoons lost one-half of their number. General Wellesley had taken the precaution of posting the Spanish division of Bassecour in the rear, together with the cavalry of both armies, and the sight of these effectually precluded any further advance of the French on that side. The principal attack of the French was against the British centre, which consisted of the Guards and the German Legion. The French columns came resolutely close up to the British line, but they were received with a discharge of musketry which made them reel back in disorder. The Guards then charged them, and in the ardour of the moment were carried too far, upon which the enemy's supporting columns and dragoons advanced, and those who had been repulsed rallied and faced again, while the French batteries poured their shot upon the flank of the Guards, who in their turn drew back in some disorder; at the same time the German Legion, which was on the left of the Guards, being hard pressed by the French, got into confusion, and the British centre was thus broken. This was the critical moment of the battle. General Wellesley, who, from the hill on the left of the position, had a clear view of the whole field, seeing the danger of the Guards, and expecting the issue of it, immediately ordered the 48th regiment, under Colonel Donellan, which was posted on the hill on the left, to advance in support of the centre, and at the same time directed General Cotton's light cavalry to advance. The 48th moved on in perfect order amidst the retiring crowds, and wheeling back by companies let them pass through the intervals; then, resuming its line, the 48th marched against the right of the pursuing columns, plied them with destructive discharges of musketry, and closing upon them with the firm and regular pace, checked their forward movement. The Guards and Germans quickly rallied, and the brigade of light cavalry coming up from the rear at a trot, the French began to waver, and at last gave way and retired to their original position, their retreat being protected by their light troops and artillery. The British, reduced to less than 14,000 men, and exhausted by fatigue, were unable to pursue them; and the Spanish army, which had been scarcely engaged, was incapable of making any evolutions; and thus about six in the evening all fighting and firing ceased, each army retaining the position that it had occupied in the morning. The French were repulsed in all points, and lost two generals and nearly 1000 men, and about 6000 wounded, besides the loss of 17 guns. On the side of the British, two generals and 800 men were killed, and three generals and about 4000 men wounded.

The next morning, July 29, at daybreak, the French army made a retrograde movement, recrossed the Alberche, and took a position on the heights of Salinas. On that day General Robert Crauford reached the English camp from Lisbon with the 43rd, 52nd, and 95th. This was the light brigade, which afterwards acquired a military celebrity for its gallantry and the quickness of its movements.

Sir Arthur Wellesley passed the 29th and 30th in establishing his hospitals in the town of Talavera, and endeavouring to get provisions, as his men were nearly starving. In this he was not at all assisted by the Spanish authorities or the Spanish inhabitants. "We are miserably supplied with provisions"—thus he wrote to Lord Castlereagh on the 1st of August from Talavera: "the Spanish armies are now so numerous that they eat up the whole country. They have no magazines, nor have we, nor can we collect any, and there is a scramble for everything. I think the battle of the 28th is likely to be of great use to the Spaniards; but I do not think them in a state of discipline to contend with the French." ('Dispatches,' iv., p. 554.)

King Joseph, with the 4th corps and the Reserve, moved on the 1st of August farther back to Illescas, on the road between Madrid and Toledo, in order to oppose the army of Andalucia under Venegas; and Victor, who had remained on the Alberche with the 1st corps, retreated likewise on the road to Madrid, from alarm at the movements of Sir Robert Wilson on his flank. Soult was now advancing from the north with no less than three corps, one of which, commanded by Mortier, entered Plasencia on the 31st, having passed, without encountering any resistance, the defile of Baños, which Cuesta had promised to guard. Soult himself, with the 2nd corps, entered Plasencia on the 1st of August, whilst Ney was moving on from Salamanca in the same direction. The French found Plasencia deserted by most of the inhabitants, and they could learn no intelligence of the position of the British and Spanish armies, except vague rumours of a battle having been fought a few days before. On the 2nd of August Sir Arthur Wellesley learnt that the enemy had entered Plasencia. Supposing that Soult was alone with his corps, which he estimated at only 15,000 men, and that his intention was to join Victor, he determined to encounter him before he could effect the junction: he therefore

Digitized by Google

marched on the 3rd of August to Oropesa with the British army, leaving Cuesta at Talavera, particularly recommending him to protect the hospitals; and, in case he should be obliged by any advance of Victor to leave Talavera, to collect carts to move away the wounded. The position of the hostile armies was now very singular: they were all crowded along the narrow valley of the Tagus, from the neighbourhood of Madrid to the frontiers of Portugal. King Joseph and Sebastiani were at Illescas and Valdemoro, between Madrid and the Tagus, while the advanced posts of Venegas were on the left or opposite side of the river, opposite Toledo. Victor was lower down on the right bank, at Maqueda, near the Alberche, watching Cuesta, who was at Talavera. General Wellesley was further down, at Oropesa. Hill was on the Tietar, on the road from Plasencia to Almaraz. Beresford, with the Portuguese, was said to be moving farther west along the frontiers of Portugal. "The allies under Wellesley and Cuesta held the centre, being only one day's march asunder; but their force, when concentrated, was not more than 47,000 men. The French could not unite under three days, but their combined forces exceeded 90,000 men, of whom 53,000 were under Soult; and this singular situation was rendered more remarkable by the ignorance in which all parties were as to the strength and movements of their adversaries. Victor and the King, frightened by Wilson's partisan corps of 4000 men, were preparing to unite at Mostoles, near Madrid; while Cuesta, equally alarmed at Victor, was retiring from Talavera. Sir Arthur Wellesley was supposed by King Joseph to be at the head of 25,000 British; and Sir Arthur, calculating on Soult's weakness, was marching with 23,000 English and Spanish to engage 53,000 French; while Soult, unable to ascertain the exact situation of either friends or enemies, little suspected that the prey was rushing into his jaws. At this moment the fate of the Peninsula hung by a thread, which could not bear the weight for twenty-four hours; yet fortune so ordained that no irreparable disaster ensued." (Napier's 'History of the Peninsular War,' b. ix.)

In the evening of the 3rd of August, Sir Arthur Wellesley learned that Soult's advanced posts were at Naval Moral, and consequently between him and the bridge of Almaraz, on the Tegus, thus cutting his line of communication with Portugal. At the same time letters from Cuesta informed him that King Joseph was again advancing to join Victor, and that Soult must be stronger than was supposed; and that therefore he, Cuesta, would quit Talavera, but would not join the British at Oropesa. Sir Arthur immediately replied, requesting Cuesta to wait at least till next morning, in order to cover the evacuation of the British hospitals from Talavera. But Cuesta was already on his march, and early on the morning of the 4th appeared at Oropesa. Sir Arthur by this time had learned from intercepted letters that Soult's force was much stronger than he had supposed, though he could not guess its full strength. Cuesta's retreat would immediately bring the King and Victor upon him. He was placed between the mountains and the Tagus, with a French army advancing 23,000 him on each flank; the retreat by Almaraz was cut off; he had seen enough of Cuesta and the Spanish army not to rely upon them on a field of battle; and he could not, with 17,000 British, fatigued and in want of provisions, fight two French armies, each of which was much stronger than his own. His only remaining line of retreat was across the Tagus, by the bridge of Arzobispo, below Talavera. By taking up a line of defence beyond that river he might keep open the road by Trujillo to Badajos. This however must be done immediately, before the enemy intercepted the road by Arzobispo. Sir Arthur communicated his determination to Cuesta, who, according to his custom, opposed it: he wanted now to fight the French at Oropesa; but the English general told him sternly that he might do as he liked—that he, Sir Arthur, was responsible for his own army, and should retire forthwith. Accordingly, on that morning, the 4th of August, the British army filed off towards Arzobispo, where it crossed the river with its artillery, stores, and 2000 wounded from Talavera, and took a position on the other side. Thus the British army was saved from impending ruin. Here ended the fighting campaign of the British for 1809.

Sir Arthur Wellesley now moved his head-quarters to Deleytosa, and afterwards to Jaraicejo, on the high road to Badajoz, leaving a strong rear-guard to protect the south bank of the Tagus, and prevent the enemy from passing the river. The bridge of Almaraz had already been broken by the Spaniards. Cuesta, following the British movement, passed to the south of the Tagus by the bridge of Arzobispo, followed close by the French, who, discovering a ford, crossed the river on the 8th with a numerous cavalry, overpowered the Spanish rear-guard, and seized the guns. General Wellesley however caused the remainder of the Spanish artillery to be dragged up the mountain of Meza d'Ibor, a strong position, while the British guarded the equally strong pass of Miravete, facing the bridge of Almaraz. The line of defence of the Allies was thus re-established. Meantime King Joseph recalled Mortier's corps, which had crossed the Tagus at Talavera, and ordered it to join Sebastiani against Venegas, who had again advanced to Almonacid, near Toledo. Marshal Ney, on the other side, whom Soult had directed to ford the Tagus below Almaraz, could not discover the ford. Soult now proposed to march with his three corps by Coria and Abrantes, and reach Lisbon, by the right bank of the Tagus, before the English; but Ney, Jourdan, and King Joseph opposed the plan, and soon afterwards a dispatch came from Napoleon, dated after the battle of Wagram, from the Austrian emperor's palace at Schönbrunn, forbidding further offensive operations till the reinforcements which the termination of the Austrian war placed at his disposal should reach Spain.

The Emperor Napoleon now, to crush his enemies, trusted chiefly to his overwhelming masses, which he recruited so cheaply by means of the conscription. The proportion of cavalry in his armies in Spain was beyond all precedent. Napoleon was resolved to play a sure game. He had already 200,000 men in Spain, and yet he did not think them enough. His generals had adopted the same views. "It is large masses only, the strongest that you can form, that will succeed:" thus wrote Soult to King Joseph before the battle of Talavera. It is worthy of remark that Sir Arthur Wellesley, writing about the same time, said,—"I conceive that the French are dangerous only when in large masses."

Soult's army now went into cantonments in Estremadura and Leon, near the borders of Portugal. Sebastiani, having defeated Venegas at Almonacid, drove him back upon the Sierra Moreua. King Joseph was again residing quietly at Madrid.

In England, on the receipt of the news of the battle of Talavera, Sir Arthur Wellesley was raised to the peerage by the titles of Baron Douro and Viscount Wellington.

On the 20th of August Lord Wellington removed his head-quarters to Badajoz, and placed his army in cantonments on the line of the Guadiana. His chief motive was the neglect of the Spanish authorities in supplying his army with provisions, which obliged him to draw near his magazines in Portugal; and another reason was, the impossibility of co operating with the undisciplined Spanish armies. Lord Wellington had contrived, notwithstanding Cuesta's neglect, to carry away 2000 sick and wounded from Talavera; the remaining 1500, whom he was obliged to leave there, he recommended earnestly to the French generals, Mortier and Kellerman, and his expectations were not deceived. Marshal Mortier in particular showed the utmost kindness to the British wounded, and would have them attended to before his own men.

In October Lord Wellington repaired to Lisbon, and proceeded to reconnoitre the whole country in front of that capital, for it was then that he resolved upon the construction of the celebrated lines of Torres Vedras, which enabled him to baffle all the efforts of the French in the following year. We can only refer the reader to the 'Memorandom' which he wrote at Lisbon on the 20th of October for Lieutenant Colonel Fletcher, of the Engineers, in which he clearly points out the double line of gun-boats, the numerous bridges of boats, the number of men required at each post, &c., as if the whole were already in existence before his eyes. This paper, so remarkable considering the epoch and circumstances in which it was written, is a most striking evidence of Wellington's comprehensive mind, his penetration, and foresight. (See 'Dispatches,' vol. v., pp. 234-39.) Of his plan however nothing was said or even whispered at the time. He returned to his head-quarters at Badajoz, whence he made an excursion to Seville, where he conferred with his brother the Marquis Wellesley, who was at that time Minister Plenipotentiary to Spain, and whom he accompanied to Cadiz. On the 11th of November he returned to his head-quarters at Badajoz. At the same time another fatal blunder was committed by the Spaniards. About the middle of November the Supreme Junta ordered the army of Andalucia, joined by the greater part of the army of Estremadura, to advance suddenly upon Madrid, and this without any previous communication with Lord Wellington, who was at Badajoz, or with the Duke del Parque and other Spanish commanders in the north of Spain. Venegas, the general of the army of Andalucia, had been superseded by Areizaga, an inexperienced young officer, who was in favour with the Junta. Old Cuesta had also retired, and made room for Eguia in the command of the army of Estremadura. These two armies, which constituted the principal regular force of the Spaniards, and which, posted within the line of the Tagus and along the range of the Sierra Morena, protected, and might long have protected, the south of Spain, were thrown away upon a foolish attempt. Areizaga, with nearly 50,000 men and 60 pieces of artillery, advanced into the plains of La Mancha, and was attacked on the 10th of November, in the open fields of Ocaña, by the two French corps of Mortier and Sebastiani; and, although his men fought with sufficient courage, yet he was completely routed, with the loss of more than one-half of his army, and all his baggage and artillery, with the exception of 15 guns. About the same time the Duke del Parque, with 20,000 Spaniards in the mountains from Salamanca against Kellerman, but he was beaten, and driven to the mountains of Peña da Francia. The Freoch, north of the Tagus, were thus left at liberty to attack Ciudad Rodrigo and the frontiers of Portugal. "I lament," thus Lord Wellington wrote from Badajoz on the news of these mishaps, "I lament that a cause which promised so well a few weeks ago should have been so completely lost by the ignorance, presumption, and mismanagement of those to whose direction it was intrusted. I declare that, if they had preserved their two armies, or even one of them, the cause was safe. The French could have sent no reinforcements which could have been of any use; time would have been gained; the state of affairs would have improved daily; all the chances were in our favour; and in the first moment of weakness

occasioned by any diversion on the continent, or by the growing discontent of the French themselves with the war, the French armies must have been driven out of Spain. But no! nothing will answer except to fight great battles in plains, in which the defeat of the Spanish armies is as certain as the commencement of the battles. They will not credit the accounts I have repeatedly given them of the superior number even of the French: they will seek them out, and they find them invariably in all parts in numbers superior to themselves. I am only afraid now that I shall be too late to save Ciudad Rodrigo, the loss of which will secure for the French Old Castile, and will cut off all communication with the northern provinces, and leave them to their fate."

Lord Wellington's anxious looks were now directed towards the north-east, for he forcsaw that the storm would burst upon Portugal from that quarter. He accordingly retired from Spanish ground altogether into Portugal, and moving through Alemtejo with the mass of his army in December, crossed the Tagus at Abrantes; and thence marching to the Mondego, fixed his head-quarters at Viseu in January 1810, having his outposts along the frontiers of Spain towards Ciudad Rodrigo. He left General Hill's division south of the Tagus to protect Alemtejo. In the mean time both he and Beresford were indefatigable in their endeavours to raise the Portuguese regular army to a state of efficiency in numbers, armament, and discipline.

Campaign of 1810.—By his campaign of 1808 General Wellesley had delivered Portugal from the French. By the campaign of the early part of 1809 he had again repelled a fresh invasion of the northern part of that kingdom. The subsequent Spanish campaign of the same year, which was undertaken with a view to assist the Spaniards in driving the French away from Castile and recovering Madrid, failed through want of good management on the part of the Spanish generals, and of discipline in the Spanish armies. The battle of Talavera, the first fought by Wellington on Spanish ground, though glorious to the British arms, led to no useful result, and the British general was obliged to evacuate Spain. Fresh blunders on the part of the Spaniards led to the conquest of Andalucia by the French. The war in Spain then assumed the character of a partisan warfare, and Wellington saw that it would be in vain for the present to expect that Spain could make any adequate effort to shake of the French yoke. Portugal however was free, and Wellington thought that she might be preserved by means of a British force of 30,000 men, assisted by an effective Portuguese army, in addition to the militia, even supposing the French should obtain possession of the remainder of the Peninsula. This he stated in a letter to Lord Castlereagh, written from Merida, 25th of August 1809, soon after his retreat from Talavera. In that remarkable letter he gives his opinion, founded upon facts, of the utter imbility of the Spanish armies, as they were then constituted, to keep the field against the French. The following passage, which concludes his exposé of Spanish military affairs, deserves notice:—"I really believe that much of the deficiency of numbers, composition, and discipline, is to be attributed to the existing government of Spain. They have attempted to govern the kingdom, in a time of revolution, by an adherence to old rules and systems, and with the aid of what is called enthusiasm; and this last is, in fact, no aid to accomplish anything, and is only an excuse for the irregularity with which everything is done, and for the want of discipline and subordination of the armies. People are very apt to believe that enthusiasm carried the French through their revolution, and was the parent of those exertions which have nearly conquered the world; but if the subject is nicely examined, it will be found that enthusiasm was the name only, but that force was the instrument which brought forth those great resources under the system of terror, which first stopped the Allies; and that a perseverance in the same system of applying every individual and every description of property to the service of the army, by force, has since conquered Europe." The system by which the French supplied their large armies in Spain, and they did everywhere else, was that of taking possession by force of everything they wanted. They ordered rations at every town, and they arrested, shot, or hanged all who put any obstacle in their way. The English generals, the allies of Spain, could not do this.

Wellington's thoughts were now directed to the defence of Portugal, of the practicability of which he entertained little or no doubt. He did not mean that he should be able to defend the whole frontier of Portugal, for that is too extensive, and is open on too many points, but that he could secure the capital and other strongholds, and the mountains and fastnesses, so as to maintain his hold and tire out the invaders. The question whether Portugal was worth defending at the enormous cost which it would entail upon England, he left for ministers at home to decide. As long as the British kept possession of Portugal the French tenure of Spain was insecure; and circumstances might, and indeed must, arise when the British and allied forces could issue out of Portugal to renew a regular war in Spain for the final expulsion of the French. Napoleon was well aware of this, and was anxious to expel the English from Portugal, for that country formed the position of support for all military operations against the French in the Peninsula. ('Dispatches,' vol. vi. p. 368.) The Portuguese in a body had confidence in the British nation and army, they were loyal to their prince, detested the French, and their troops had submitted to British discipline. Portugal was a sincere and tolerably docile ally of England, which Spain was not and could not be. In an official letter to Lord Liverpool, dated Badajoz, 14th of November 1809, after he had given directions for fortifying the lines near Lisbon, Wellington stated that Portugal might be defended by a British effective force of 30,000 men, in aid of which the whole military establishment of Portugal, consisting of about 45,000 regulars, which however were as yet far from effective. And in a confidential letter also to Lord Liverpool, of the same date, he says—"I do not think the French will succeed in getting possession of Portugal with an army of 70,000 or even of 80,000 men, if they do not make the attack for two or three months, which I believe now to be impossible. I conceive not only that they may, but will, make the attack before they will subdue the north of Spain. The centre of Spain, or Old Castile, is already subdued. . . . My opinion is that the enemy have neither the means nor the intention of attacking Portugal at present, and that they would be successfully resisted. I am likewise of opinion that when they shall receive their reinforcements they can be successfully resisted." And as he had foreseen, so it happened.

Wellington continued in his head-quarters at Viseu till the end of April 1810, watching the movements of the French in old Castile, and preparing against their attack upon Portugal, which he expected would be made in earnest that year. The French armies in Spain had received large reinforcements during the winter from Germany, in consequence of the peace between France and Austria. Junot and Drouet, with two fresh corps, had entered Spain, followed by a part of Napoleon's imperial guards. Ney, Kellerman, and Loison, with about 60,000 men, were, in the month of April, in Old Castile and Leon, evidently preparing for an attack upon Portugal. As a pretext they had besieged and taken Astorga from the Spaniards, and were making preparations for the siege of Ciudad Rodrigo, which was defended by a Spanish garrison.

Soult was now in the south of Spain, with Victor and Mortier under him certainly, and was busy in organising his military resources and establishing his military command in Andalucia. There is a very interesting report by Soult to the Prince of Wagram, dated Seville, 4th of August 1810, which is given in the Appendix to Napier's third volume, and which shows his activity and his administrative abilities at that commander, and, at the same time, the misunderstandings between him and the nominal King of Spain, Joseph Bonaparte, and his Spanish ministers. General Regnier was in Estremadura, ready to co-operate with his countrymen in the north in the invasion of Portugal by either side of the Tagus. His movements were anxiously watched by General Hill, with about 12,000 British and Portuguese, stationed on the frontiers of Alemtejo. At the south-western extremity of Spain, Cadiz, strong by its situation, was garrisoned by a British force, of about 7000 men, under General Graham, in addition to the Spanish troops, and the French, under Victor, were blockading the place. In the north the Spanish patriots remained in possession of Galicia and Asturias, but not in sufficient force to effect any powerful diver-sion. In the east of Spain, Valencia and Murcia still held out, but Catalufia was the only province in which the Spanish general O'Donnell, the best of the Spanish generals, kept up a regular system of warfare against the French. O'Donnell was assisted by the nature of the ground, which was interspersed with numerous fortresses, and also by the English squadron along the coast, and by the organisation and daring spirit of the Catalonian militia. But the struggle in that province was too remote to have any influence on the operations in Portugal and Andalucia. The conquest of Portugal was the great object of the French campaign of 1810.

About the middle of May Marshal Massena, Prince of Essling, arrived at Valladolid, having been sent by Napoleon to take the command of the army assembled in Old Castile and Leon, which assumed the name of the 'Army of Portugal.' He had also military command over the provinces of northern Spain. His force consisted of the 2nd corps under Regnier, 6th corps under Ney, and 8th under Junot, and the reserve cavalry under Montbrun—in all 72,000 men under arms for the field, besides garrisons, detachments, &c., in the provinces of Valladolid, Santander, and Leon. To the above number was afterwards added, in the course of the campaign, the 9th corps, under Drouet, consisting of about 18,000 men. Lord Wellington had to oppose the whole of this force with about 54,000 British and Portuguese regular troops. There was moreover a considerable Portuguese militia, employed mostly in the garrisons and in the provinces beyond the Douro, in Alemtejo and Algarve—and in short, on the wings of the regular force. It must be observed also that Massena could concentrate his whole force for his attack on Portugal north of the Tagus, whilst Lord Wellington was obliged to leave part of his force south of that river, to guard against any sudden movement from the French army of Andalucia, which was more than 60,000 strong, of which a part might attempt to advance into Alemtejo. Again, Massena's troops were mostly old soldiers, flushed with success and in a high state of discipline, whilst Lord Wellington could only confidently rely upon the British part of his force, about 25,000 men, as the Portuguese regular army was yet untried, and the militia were as defective in organisation as not to be trusted in the open field. Marshal Beresford however had taken great pains with the Portuguese regulars, many of the officers were English, and Lord Wellington had brigaded several of their regiments with the British.

Early in June the French invested Ciudad Rodrigo almost in sight of the British advanced division, which was posted on the Azava. On the 25th they opened their batteries, and the Spanish governor, a brave old officer, defended himself till the 10th of July, when, a practicable breach being made, the French entered the place by capitulation. Wellington could not risk his army for the relief of Ciudad Rodrigo; his object was to defend Portugal, and, above all, Lisbon. He states in the clearest manner his reasons for not attempting to relieve Ciudad Rodrigo in his dispatch to Lord Liverpool from Pero Negro, 27th of October 1810, in answer to the charges in the French 'Moniteur.' He retained his position on the left bank of the Coa, and the French advanced to that river, and in so doing the corps of Ney encountered the British light division under General Craufurd, who disputed the ground against a numbers superior force, and in the effected his retreat by a bridge across the Coa, which the French unsuccessfully attempted to pass. The fire of the British killed and wounded about 1000 of them. This fight was against Lord Wellington's intentions, for it was useless, but it gave Massena a specimen of the resistance that he had to encounter in his march to Lisbon, which was the declared object of his expedition. On entering the frontiers of Portugal, after taking Ciudad Rodrigo, Massena issued a proclamation to the Portuguese in the usual style of French proclamations of those times, abusing the English as the cause of all mischief, and attributing the presence of an English army in Portugal to the "insatiable ambition" of England. He sneered at the English for not having attempted to relieve Ciudad Rodrigo, which he knew they could not have done in the face of an enemy three times as strong. Massena ended by recommending to the Portuguese population to remain quiet, and receive the French soldiers as friends, assuring them of protection for their persons and property. How this last promise was kept from the beginning is stated by Lord Wellington in a counter-proclamation which he issued a few weeks afterwards, dated Celorico, August 4:—"The time which has elapsed during which the enemy have remained upon the frontiers of Portugal has fortunately afforded the Portuguese nation experience of what they are to expect from the French. The people had remained in some villages trusting to the enemy's promises, and vainly believing that, by bearing the cruelties of their conduct in a friendly manner, they should conciliate their forbearance, and that their properties would be respected, their women would be saved from violation, and that their lives would be spared.—Vain hopes! The people of these devoted villages have suffered every evil which a cruel enemy could inflict. Their property has been plundered, their houses and furniture burnt, their women have been ravished, and the unfortunate inhabitants whose age or sex did not tempt the brutal violence of the soldiers, have fallen the victims of the imprudent confidence they reposed in promises which were only made to be violated. The Portuguese now see that they have no remedy for the evil with which they are threatened but determined resistance. Resistance, and the determination to render the enemy's advance into their country as difficult as possible, by removing out of his way everything that is valuable, or that can contribute to his existence or facilitate his progress, are the only and certain remedies for the evils with which they are threatened. The army under my command will protect as large a proportion of the country as will be in their power; but it is obvious that the people can save their property by resistance to the enemy, and their properties only by removing them. The duty however which I owe to his Royal Highness the Prince Regent, and to the Portuguese nation, will oblige me to use the power and authority in my hands to force the weak and the indolent to make an exertion to save themselves from the danger which awaits them, and to save their country; and I hereby declare that all the magistrates or persons in authority who remain in the towns or villages after receiving orders from any of the military officers to retire from them, and all persons of whatever description who hold any communication with the enemy, and aid and assist them in any manner, will be considered traitors to the state, and shall be tried and punished accordingly." ('Dispatches,' vi. pp. 229, 230.)

Massena remained nearly a month inactive on the line of the Coa before he began the siege of Almeida, the frontier fortress of Portugal on that side. The French broke ground before it on the 15th of August, and Lord Wellington moved his army to the front to take advantage of any opportunity which might be afforded of relieving the place, which was defended by a Portuguese garrison commanded by an English officer. The French opened their fire on the 26th of August, and on the night of the 27th, in consequence of the explosion of a magazine containing nearly all the ammunition in the place, and by which a large part of the town and defences were destroyed, the governor was obliged to capitulate. Wellington now greatly disappointed, for he reckoned on the place detaining the French till the rainy season set in. He then fell back with the main body of his army to the valley of the Mondego. Another considerable pause occurred in Massena's movements, but on the 15th of September the French army began their march down the valley of the Mondego by the right bank of the river, in the direction of Coimbra, through Viseu. "There are certainly," Lord Wellington observed, "many bad roads in Portugal, but the enemy has taken decidedly the worst in the whole kingdom."

Wellington, who had retired by the left bank, then crossed the river, and took up a strong position in front of Coimbra, along a high ridge called the Serra de Busaco, which extends from the Mondego northwards. General Hill joined Wellington with his division from the south, leaving some troops on the left bank of the Mondego to secure the high road to Lisbon on that side. With this exception Lord Wellington's whole army was collected upon the Serra de Busaco. On the 26th of September the French army, consisting of the 2nd, 6th, and 8th corps, assembled before it, and some skirmishing took place. In the morning of the 27th the French attacked in great force both the right and the left of the British position; one French column reached the top of the ridge, and was in the act of deploying when it was repulsed by General Picton's division, as well as another which could not even reach the summit; and on the left the French were likewise repulsed and thrown down the hill by a charge with the bayonet from Craufurd's division and a Portuguese brigade. The French lost one general and about 1000 killed, two generals and about 3000 wounded, and one general and several hundred men prisoners. The loss of the Allies did not exceed 1300. "This movement," says Wellington, "has brought the Portuguese levies into action with the enemy for the first time in an advantageous situation, and they have proved that the trouble which has been taken with them has not been thrown away, and that they are worthy of contending in the same rank with British troops in this interesting cause, which they afford the best hopes of saving." ('Dispatches,' vi. p. 475.)

One of the motives of Lord Wellington in fighting the battle of Busaco was to give time to the population of the country in his rear to remove out of the way of the enemy with their goods and provisions, especially from Coimbra, a populous city and town, but the orders given to that effect were ill obeyed. Massena did not attempt again to force the position of Busaco, but moved off his army by the pass of Boyalva, in the mountains north of Busaco. Lord Wellington had directed Colonel Trant to occupy this pass with a Portuguese division; but Trant missed the direct road, and arrived too late and with too small a force to arrest the march of the French, who descended into the maritime plains, and seized on the road leading from Oporto to Coimbra in the rear of the British.

On the 30th of September the British quitted the position of Busaco, and, crossing the Mondego, began their retreat towards Lisbon. On the 1st of October the British rear-guard, after some skirmishing with the French, evacuated Coimbra, accompanied by all the remaining inhabitants, who ran away with whatever movables they could carry, and that city, the seat of the earliest, and the oldest, and most celebrated, not knowing whither they were going, and encumbering the road, whilst the French cavalry was hovering on the flank and rear. It was a piteous sight, and one which those who saw it can never forget. The French entered the forsaken city, and found ample stores of provisions. On the 2nd of October Lord Wellington's head-quarters were moved to Leiria, where he stayed two days, the French following slowly, and the British and Portuguese effecting their retreat with great ease and regularity. General Hill with his division moved by Thomar and Santarem, the centre of the army by Leiria and Rio Mayor, and the left by Alcobaca and Obidos. Massena followed in one column by the centre or Rio Mayor road. Some skirmishing only took place between his advanced guard and the light division which formed the British rear. On the 5th the allied army entered the lines which had been prepared for them, just as the autumnal rains, which fall very heavily in Portugal, were beginning to set in. Never was a retreat, before a formidable enemy, effected with more ease or so little loss. On the 10th of October the whole army was within the lines.

The line of defence was double. The first, which was 29 miles long, began at Alhandra on the Tagus, crossed the valley of Aruda, which was rather a weak point, and passed along the skirts of Mount Agraca, where there was a large and strong redoubt: it then passed across the valley of Zibreira and skirted the ravine of Enxara, the heights of Torres Vedras, which were well fortified; thence the line followed the course of the little river Zizandro to its mouth on the sea-coast. This first line of defence followed the sinuosities of the mountain tract which extends from the Tagus to the sea, about 30 miles north of Lisbon. Lord Wellington's head-quarters were fixed at Pero Negro, a little in the rear of the centre of the line, where a telegraph was fixed corresponding with every part of the position. The second line, at a distance varying from six to ten miles in the rear of the first, extended from Quintella on the Tagus, by Sacadina, Monte Chique, and Mafra, to the mouth of the little river S. Lourenco on the sea-coast, and was 24 miles long. This was the stronger line of the two both by nature and art, and, if the first line were forced by the enemy, the retreat of the army upon the second was secure at all times. Both lines were secured by breastworks, abattis, stone walls with banquettes, and scarps. In the rear of the second line there was a line to secure the embarkation of the troops, should that measure become necessary, enclosing on entrenched camp and the Fort of St. Julian. More than 100 redoubts or forts and 150 pieces of artillery were scattered along these lines. Lord Wellington had received reinforcements from England and Cadiz; the Portuguese army had also been strengthened, and the Spanish division of La Romana, 5000 strong, came from Estremadura to join the allies, so that the British commander had about 60,000 regular troops posted

Digitized by Google

along the first and second lines (Dispatch to Lord Liverpool, vol. vi. p. 582), besides the Portuguese militia and artillery which manned the forts and redoubts and garrisoned Lisbon, a fine body of English marines which occupied the line of embarkation, a powerful fleet in the Tagus, and a flotilla of gun-boats flanking the right of the British line. Altogether these lines of defence were of stupendous strength, conceived by the military genius of Lord Wellington, and executed by the military skill of the British engineer officers.

Massena seems to have been taken by surprise at the sight of the lines, and he employed several days in reconnoitering them. He made some demonstrations in order to make the British division show out their force; but after one or two slight attacks, which were repulsed, he made no further attempt. He put the second and eighth corps partly in the villages and partly in bivouacs in front of the right and centre of the British position, leaving the sixth corps at Otta in his rear. He established his depôt and hospitals, and commenced forming magazines at Santarem, and for this purpose sent moveable columns to scour the country for provisions, for he had entered Portugal without magazines, every soldier carrying fifteen days' bread, which many however threw away or wasted on the road. The country had been partly stripped by the inhabitants, who had retired to the mountains or within the lines, and the French foraging parties destroyed what was left, so that for many leagues in rear of the French the country became a scene of devastation and almost a desert. In addition to this, the Portuguese militia under Trant, Millar, and Wilson, came down from the north and cut off all communication between Massena's army and the Spanish frontier. Whilst the French were in march for Lisbon, as they thought, Colonel Trant surprised Coimbra, seized many prisoners, and all the sick and wounded, between four and five thousand in number, who were removed to Oporto. Trant and Wilson came down towards Ourem, Thomar, and the banks of the Zezere, hovering in the rear of Massena, who was obliged to move back a whole division to hold them in check. Towards the end of October, Massena sent 2000 men across the Zezere at Abrantes to re-open a communication with Spain by way of Castello Branco; and General Foy proceeded with a strong escort by way of Penomacor to Ciudad Rodrigo, whence he hastened to Paris to inform Napoleon of the real state of affairs in Portugal.

Massena had now given up all idea of attempting to force the British lines unless he received large reinforcements. He had entered Portugal with about 70,000 men, of whom 15,000 had been either killed or taken prisoners or were in the hospitals; his army had become very sickly in consequence of privations and of being exposed to the inclement weather mostly without shelter, and bivouacking in low grounds. On the 15th of November he began a retrograde movement, with great order and caution, for the purpose of placing his army in cantonments for the winter. On the 17th the French second corps was established at and near Santarem, very strong posts with the eighth corps at Pernes; and the sixth corps at Thomar, farther in the rear. Massena's head-quarters were fixed at Torres Novas. The British light divisions and cavalry followed the French movements and took some prisoners, but nothing of importance occurred. Lord Wellington, leaving part of his troops in the lines, moved forward the remainder towards the Rio Mayor, which separated him from the French position at Santarem. Hill's division was placed on the left bank of the Tagus opposite Santarem. Wellington's head-quarters were fixed at Cartaxo. Both armies were in cantonments for the winter. Thus ended the campaign of 1810. As a defensive campaign on the part of Lord Wellington it was successful, for the French army at the end of that year held no other ground in Portugal than that on which its divisions stood, being hemmed in between the northern bank of the Tagus, the Rio Mayor, and the ridge of the Serra de Estrella, having the allied regular force on its front and flanks, and the Portuguese militia on its rear, and its communications with Spain intercepted.

All the north of Portugal was free from the French, and also the whole of the kingdom south of the Tagus, and the fine country near Lisbon. All the large towns, Lisbon, Oporto, Coimbra, Abrantes, were in possession of the Allies, as well as all the fortresses, with the exception of Almeida. As the French had advanced by the valley of the Mondego and the country west of the Serra de Estrella, the people of that tract of country had in great measure deserted it and carried off the provisions; but the population east of the mountains, and between them, the Tagus, and Thomar, remained in fancied security, so that, when Massena withdrew his army to that quarter, he found the towns of Thomar, Pernes, Torres Novas, and Golegão inhabited and untouched. The corn-mills, little injured, were quickly repaired; cattle and corn were procured in abundance, especially from the fine plains of Golegão, which supplied them with Indian corn; and the French thus obtained provisions at least for part of the winter. And, what was worse for the Allies, a number of boats were left behind at Santarem on the right bank of the Tagus, by means of which the French had the power of crossing the river whenever they liked. This annoyed Lord Wellington more than anything else, and he expressed himself strongly concerning the remissness of the Portuguese Regency in neglecting to give or not enforcing the necessary orders for removing everything out of the reach of the enemy, as he had urged them to do months before. "The French could not have stayed if the provisions had been removed. . . . All our military arrangements are useless if they can find subsistence on the ground which they occupy. . . . Then the boats are left at Santarem in order to give the enemy an opportunity of acting upon our flanks. . . . It is heart-breaking to contemplate the chance of failure from such obstinacy and folly." (Dispatches to Charles Stuart, the English Ambassador to the Portuguese Regency, October 16 and 18, and November 1.)

The perverse spirit of the Portuguese Regency had manifested itself ever since the fall of Almeida. There was a faction in the Regency, at the head of which was the Patriarch (former Bishop of Oporto), who was averse to central and direct co-operation with the British commander, and, as he would not allow himself to be directed by them they thwarted him in every way. In a remarkable letter addressed to Mr. Stuart from Gouvea, September 7, Lord Wellington had denounced their practices:—"In order to put an end at once to these miserable intrigues, I beg that you will inform the Portuguese Government that I will not stay in the country, and that I shall advise the King's Government to withdraw the assistance which his Majesty affords them, if they interfere in any manner with the appointments of Marshal Beresford's staff, for which he is responsible; or with the operations of the army; or with any of the points which, under the original arrangement with Marshal Beresford, were referred exclusively to his management. I propose also to report to his Majesty's Government, and refer to their consideration, what steps ought to be taken if the Portuguese Government refuse or delay to adopt the civil and political arrangements recommended by me, and corresponding with the military operations which I am carrying on. But it appears that the Portuguese Government have lately discovered that we are all wrong; they have become impatient for the defeat of the enemy, and, in imitation of the Central Junta of Spain, call out for a battle and early success."

In another letter, dated Rio Mayor, October 6, addressed likewise to Mr. Stuart, Lord Wellington says—"You will do me the favour to inform the Prince Regency, and the Portuguese Nation, that his Majesty and the Prince Regent having intrusted me with the command of their armies, and likewise with the conduct of the military operations, I will not suffer them, or anybody else, to interfere with them; that I know best where to station my troops and when to make a stand against the enemy; and I shall not alter a system formed upon mature consideration upon any suggestion of theirs. I am responsible for what I do, and they are not; and I recommend them to look to the measures for which they are responsible, and which I hope may be recommended, to their advantage, for the future safety of Lisbon, and for the food of their own army and of the people, while the troops will be engaged with the enemy. As for Principal Souza, I beg you to tell him from me that I have had no satisfaction in transacting the business of his country since he has been a member of the government; that, being embarked in a system of military operations, of which I hope to see the successful termination, I shall continue to carry them on to the end, but that no power on earth shall induce me to remain in the Peninsula for one moment after I shall have obtained his Majesty's leave to resign my charge, if Principal Souza is to remain either a member of the government or to continue at Lisbon. Either he must quit the country or I will; and if I should be obliged to go, I will take care that the world, or Portugal at least and the Prince Regent, shall be made acquainted with my reasons. . . . I have but little doubt of success in the end; but I have fought a sufficient number of battles to know that the result of any one is not certain, even with the best arrangements, I am anxious that the Government should adopt preparatory arrangements, and take out of the enemy's way those persons and their families who would suffer if they were to fall into their hands." A perusal of this correspondence is absolutely necessary to enable a person to form a just idea of the difficulties which Lord Wellington had to contend with, and of the strength of mind which enabled him to rise superior to them.

Campaign of 1811.—During the months of January and February the armies in Portugal remained in the same respective positions. The low lands being flooded rendered field operations impossible. Meanwhile the 9th corps under Dronet had entered Portugal by the valley of the Mondego, with a large convoy of provisions for the army, and had reinforced Massena's army, by being posted on its right about Leiria. At the same time Soult, who commanded the army of Andalucia, received orders from Napoleon to act in concert with Massena, by attacking Portugal south of the Tagus; and a new French army was formed in the north of Spain, consisting of about 70,000 men, and placed under Marshal Bessières, duke of Istria, who was ordered to support and furnish all necessary assistance to the army of Portugal. (Letter from Berthier, Prince of Wagram, to the Prince of Essling (Massena), Paris, January 16, 1811; another from the same to the Duke of Dalmatia (Soult), January 24, 1811; and another from the same to the Prince of Essling, February 7, 1811; in Appendix to Napier, vol. iii.) "Make a bridge across the Tagus," said Napoleon, "and let Massena and Soult form a junction. Meantime keep the English in check, and make them lose men every day by engagements of the advanced guards. Their army is small, and they cannot afford to lose many men. Besides, people in London are much alarmed about their army in Portugal; and when the season becomes favourable let the main operations be carried on on the south bank of the Tagus."

Digitized by Google

Such were the gigantic efforts made by the master of half of Europe to crush an English army of 30,000 men, whilst Lord Wellington, after urgent applications to ministers at home, received reinforcements to the amount of from 6000 to 7000 men only in the beginning of March. But all Napoleon's efforts did not prevail. Massena was waiting for Soult to appear on the left bank of the Tagus opposite to his position, but Soult was obliged to maintain the blockade of Cadiz, in which there was a British garrison of 6000 men; he was obliged to leave Sebastiani on the side of Granada and Murcia to keep in check the Spanish armed parties; and he could not therefore dispose of more than 20,000 men, with whom he threw out order Alemtejo, leaving the Spanish fortress of Badajos in his rear. He therefore began by attacking the fortress of Olivença, which he took January 22, and then marched to Badajos. On the 19th of February he defeated a Spanish force of nearly 12,000 men under General Mendizabal, which was posted on the river Gebora, an affluent of the Guadiana, and then commenced the siege of Badajos.

In the mean time Massena remained in his position at Santarem, waiting for Soult's appearance on the Tagus, till he became so distressed for provisions that he could wait no longer. All the means of collecting provisions by violence were exhausted, large moveable columns had been sent at different times both on the side of Castello Branco and on that of the Mondego, which scoured the country and carried away cattle and provisions, committing horrible excesses, which were retaliated by the infuriated peasantry upon the French stragglers and wounded. The discipline of the army was broken by this barbarous system of warfare. They had no less than 10,000 sick; they could obtain no news from Spain, and had no more provisions left than would serve the troops during their retreat to the frontiers.

In the beginning of March Massena moved his sick and baggage by degrees to the rear, and after demonstrations in various directions the divisions of his army filed off in the direction of Pombal. Santarem was evacuated in the night of the 5th of March, and next morning it was entered by the English. Massena however had gained two days' march, and his army was not overtaken by the English till the 10th, when it was concentrated on a table-land before Pombal, presenting a front of resistance. There was some skirmishing with the light division, whilst Wellington brought up his other divisions, but the French having gained time for their baggage to file off, retreated on the 11th through the town. A detachment which Ney had left in the castle of Pombal was driven away with some loss by the English, and in the night Massena continued his retreat. On the 12th the English advance found Ney with the French rear-guard posted on a high table-land in front of the village of Redinha, when another skirmishing took place. As the French seemed disposed to stand their ground, and made a show of considerable force, Lord Wellington formed his army in line and moved on to the attack, when, after a general discharge from the French battalions, which hid them in smoke, the French were again in full retreat through the village, and joined that evening the main body at Condeixa, where one road leads to Coimbra and another ascends the valley of the Mondego. Massena's intention was to seize Coimbra and, if possible, Oporto, and there to wait for reinforcements from Spain, and he had sent a division under Montbrun to secure the bridge of Coimbra. Wellington had foreseen his intention, and had ordered Wilson and Trant with the Portuguese militia to look to the security of the important town of Oporto, and to abandon the line of the Mondego, which was fordable in many places, and retire across the Douro, removing all the boats. Coimbra was thus accessible by surprise by the French rear-guard during army. But it luckily happened that Trant lingered behind at Coimbra with a small force, and, having destroyed one arch of the bridge, and placed guards at the fords, he determined to defend the town, thinking that, if he could parry a sudden assault, Massena could not stay long on the left bank of the Mondego with the allied army at his heels. On the 11th of March Montbrun appeared at the suburb of Santa Clara, and on the 12th made an attempt to force the bridge, but his men were repulsed by grape-shot. Montbrun fancied that Trant had been reinforced with some English regiments by sea, and having made his report, Massena relinquished the idea of crossing the Mondego, and determined to retreat by Ponte de Murcella and the left bank of the Mondego. Thus Coimbra was saved from the impending visitation.

Massena resumed his retreat on the 13th of March in rather a hurried manner, being on the point of having his left turned by Picton's division, which had marched by a path over the mountains of Ancião. Ney, in command of the rear-guard, set fire to the town of Condeixa, in order to stop the British artillery, but the light division pursued the retreating enemy, and penetrated between the columns, until night stopped any further pursuit. By the aid of darkness the French got together again, and on the morning of the 14th, when the fog which enveloped the mountains began to clear off, Ney was seen posted on a hill near Casal Nova. The light division attacked him; and Picton's and Cole's divisions appearing on his left, he renewed his retreat with admirable precision from ridge to ridge, covering his rear with guns and light troops, until he gained the strong defile of Miranda de Corvo, where the main body of the French was already posted. Massena, fearing that Cole's and Nightingale's divisions, which were advancing by the road of Espinhal, might gain his rear, set fire to the town of Miranda in the night, and passed the river Ceira, an affluent of the Mondego, destroying a great quantity of his baggage and ammunition, and leaving Ney to cover the passage of the river, without however risking an action. Ney remained on the left bank, and took up a position near the village of Foz de Arrouce. The Allies coming up about four o'clock in the afternoon of the 15th, Wellington commenced an attack on Ney's troops, in which the French lost 500 men, one-half of whom were drowned in endeavouring to pass the swollen river in their rear. Night put an end to the fight, but not to the confusion; for as the French baggage and other incumbrances were pressing along the bridge, panic spread among their troops, who, in the midst of the disorder, darkness, and rain, fired upon one another. In the night Ney blew up part of the bridge, and moved on his corps, keeping a rear-guard on the right bank the whole of the 16th. The Allies halted on the left bank that day, partly because the river was not fordable, and partly because they were in want of provisions, especially the Portuguese troops, for the Portuguese Regency, in spite of the urgent representations of Wellington and Beresford, had neglected to collect the means of carrying provisions along with the army. Nothing could be got from the country, which had been twice ravaged. Some of the Portuguese brigades were actually starving; many men fell off and died, and to save the rest the British supplies were shared with them. The British commissary-general's means were thus overlaid, and the whole army suffered in consequence. (Dispatches to Charles Stuart, dated Louzão, March 16, and Pombeiro, March 18, and another to the Earl of Liverpool of March 16.) On the 17th the British army crossed the Ceira over a trestle bridge, the French having withdrawn in the night.

Massena had taken up a strong position on the river Alva, another affluent of the Mondego, which was swollen by the rains, and had destroyed the bridge of Murcella, apparently intending to remain there some days. He had also sent out detachments to scour the neighbouring country for provisions. But Wellington marched these divisions by the mountains of Quiteria to Arçanil, on the Upper Alva, which movement obliged the French marshal to abandon the Lower Alva, and continue his retreat by Moita, towards Celorico. The English army crossed the Alva near Pogio, and collected at Moita on the 19th. Here again Massena destroyed much of his baggage and ammunition, for want of cattle to drag it, and also forsook the foraging parties that he had sent out, which were intercepted and taken by the English, to the number of about 800 men. The main body of the allied army halted at Moita for several days, in order to give time for the provisions to come up which had been sent round by sea from Lisbon to the Mondego. The light division and cavalry however continued to follow the French, who reached Celorico and Trancoso the 21st, and remained there for several days, developed his communications with Almeida and the Spanish frontier. The retreat of the French, properly speaking, may be considered as having terminated here—a fortnight's retreat "in which the French commander displayed infinite ability, but wilful a harsh and ruthless spirit. I pass over the destruction of Redinha, Condeixa, Miranda de Corvo, and many villages on the route; the burning of those towns covered the retrograde movements of the army, and something must be attributed to the disorder which usually attends a forced retreat; but the tow of Leiria and the villages of Alcoleya were given to the flames by express orders from the French head-quarters; and although the laws of war, rigorously interpreted, authorise such examples when the inhabitants take arms, it can only be justly done for the purpose of overawing the people, and not from a spirit of vengeance when abandoning the country. But every horror that could make war hideous attended this dreadful march. Distress, conflagration, death in all modes! from wounds, from fatigue, from water, from the flames, from starvation! On every side unlimited violence, unlimited vengeance. I myself saw a peasant wounding at his ease a man in the dead and dying; and the spirit of cruelty, once unchained, smote even the brute creation. On the 15th the French general, to diminish the encumbrance of his march, ordered a number of beasts of burden to be destroyed. The inhuman fellow charged them like an execution battalion 600 asses, and left them to starve, and thus they were found by the British army on that day. The mute but deep expression of pain and grief visible in these poor creatures' looks wonderfully roused the fury of our soldiers, and so little weight has reason with the multitude when opposed by a momentary sensation, that no quarter would have been given to any prisoner at that moment. Excess of feeling would have led to direct cruelty. This shows how dangerous it is in war to listen to the passions at all, since the most praiseworthy could be thus perverted by an accidental combination of circumstances." (Napier, 'Peninsular War,' vol. iii., pp. 471, 472.) Lord Wellington, habitually sober in the expression of his sentiments, assumes even a more decided and indignant tone on the same occasion. In his official dispatch to Lord Liverpool, dated March 14, after detailing the movements of the French to that day, he thus continues:—"I am sorry to be obliged to add to this account that their conduct throughout this retreat has been marked by a barbarity seldom equalled, and never surpassed. Even in the towns of Torres Novas, Thomar, and Pernes, in which the head-quarters of some of the corps had been for four months, and in which the inhabitants had been invited, by promises

Digitized by Google

of good treatment, to remain, they were plundered, and many of their houses destroyed, on the night the enemy withdrew from their position, and they have since burnt every town and village through which they have passed. The convent of Alcobaça (a splendid structure) was burnt by orders from the French head-quarters. The bishop's palace and the whole town of Leiria, in which General Drouet had had his head quarters, shared the same fate; and there is not an inhabitant of the country, of any class or description, who has had any dealing or communication with the French army, who has not had reason to repent of it, and to complain of them. This is the mode to which the promises have been performed and the assurances have been fulfilled which were held out in the proclamation of the French commander-in-chief, in which he told the inhabitants of Portugal that he was not come to make war upon them, but with a powerful army of 110,000 men, to drive the English into the sea." (Dispatches, vol. vii. p. 358.)

On the 25th of March the French abandoned Celorico, but retained the position of Guarda. On the 26th however Lord Wellington moved his columns up the steep hill of Guarda, when the French retreated to the Coa, without firing a shot—the rear-guard in excellent order. On the 2nd of April the British army came up with them, and found them posted on the right bank of the Coa. On the 3rd the light division passed the Coa on the left of the French, and drove in their light infantry; but the main body of the French advanced, and a rain-storm coming on at the moment, the men of the light division could not see that they were pushing too far. When the weather cleared up, the French, seeing that only a small force had crossed the river, attacked it in columns with cavalry. Three times the 43rd and 52nd regiments were driven back towards the river, and three times they rallied and beat back the enemy. At last, Picton's division having crossed the Coa, and the 5th division also making its appearance by the bridge of Sabugal, the whole French army retired upon Almeyda, having sustained considerable loss in men and also in baggage. This was called the combat of Sabugal, in which the light division lost about 260 men. On the 4th the French were about Aldea da Ponte and Aldea Velha, on the extreme frontier of Portugal, and on the 6th they crossed the Agueda into Spain. Thus terminated the third and last French invasion of Portugal. They left a garrison in Almeida, which was blockaded by the English. "The enemy's loss in this expedition to Portugal is immense—I should think no less than 45,000 men, including the sick and wounded; and I think that, including the 9th corps, they may have now 40,000 men on this frontier." (Dispatches to Lord Liverpool, April 9, 1811.) A great part of the loss of the French, in killed, was from the hands of the Portuguese peasantry, who revenged themselves for the injuries which had been inflicted on their countrymen during the six preceding months that the French had remained in Portugal, by killing every straggler whom they could lay their hands upon before the British column came up. Dismal scenes of suffering and death presented themselves along the whole line of the French retreat—long files of dead soldiers, generally naked, carts broken down on the road, carcasses of horses and mules. Some of the poor creatures seemed to have crawled or been dragged out of the road to die behind the loose stone walls with which the fields are enclosed; and, on looking over the stone walls into the fields, they were lying in clusters of thirty or forty, four or more, in all sorts of positions. Portuguese villagers, men and women, were occasionally seen insulting and kicking the bodies of dead Frenchmen on the road, when they were properly reproved and driven away by a British non-commissioned officer. It was chiefly in the mountain-valleys of the Serra de Estrella that the work of destruction had been carried on by the French during the winter of 1810-11. The marauding parties went searching for provisions in those sequestered valleys, and when they fell upon a hamlet or farm-house they showed no mercy to the inmates. Sometimes in the mountains they pounced upon several families huddled together in a cave, with a provision of Indian corn or pulse to last them for the winter. The males were soon despatched—the females spared for a time, but not in mercy. It happened however at times that these marauding parties were small, and they were overpowered by the peasantry, who gave no quarter.

The orders given by the Regency of Portugal, at Lord Wellington's request, for the people of Beira and Estremadura to withdraw from the open country upon the advance of the enemy, had produced a large influx of population within the lines during the winter. These people were assisted partly by their own countrymen, and partly by a gift of 100,000*l.* voted by the British Parliament, and by subscriptions raised in England. After the retreat of Massena they returned to their homes, when the poorer class received further assistance during the remainder of that year and the following winter.

Lord Wellington having placed his army in cantonments between the Coa and the Agueda, and made arrangements for the blockade of Almeida, set out for the south to see the state of affairs on the Guadiana. Marshal Beresford commanded the allied troops in Alemtejo, in the absence of General Hill, who had gone home on leave. The Spanish General Mendizabal, having been utterly defeated by the French in the preceding February, Soult had invested the fortress of Badajoz, the governor of which, General Menacho, was unfortunately killed by a cannon shot. The command of the garrison devolved upon General Imaz, who, on the 10th of March, only one day after the breaching battery had opened, and the breach was far from practicable, surrendered the place, although he knew by a telegraphic dispatch that a large British and Portuguese force was advancing to his relief, as Massena, being then in full retreat, Lord Wellington had sent troops to reinforce Beresford and to save Badajoz. In the mean time General Graham, with the British garrison of Cadiz, defeated the French under Victor in the battle of Barrosa, but not being supported by the Spanish troops, he was obliged to return to Cadiz.

Marshal Soult having obtained Badajoz, repaired to Seville; and Mortier, who succeeded him in command in Estremadura, laid siege to Campo Mayor, a weak place within the frontiers of Portugal, with a garrison of only a few hundred men; but the commander, a Portuguese officer of engineers, defended himself bravely until a regular breach was made, when, being commoned, he asked of Mortier four-and-twenty hours more to wait for succour. Mortier granted the honourable demand of the brave veteran, and at the expiration of the time agreed upon the place was surrendered.

Marshal Beresford, having been reinforced from the north by Lord Wellington, was advancing at the head of 22,000 men; and at his appearance, on the 25th of March, the French, hastily evacuating Campo Mayor, withdrew to Badajoz after a sharp skirmish with the British cavalry. Beresford had orders from Wellington to invest Badajoz before the enemy could provision and repair their conquest. Crossing the Guadiana, he advanced into Spanish Estremadura, Mortier having retired before him, and Beresford placed his army in cantonments about Zafra and Merida to invest the siege of Badajoz. He began by besieging and taking Olivença; and shortly afterwards, April 20, Lord Wellington arrived from the north, reconnoitred Badajoz, and ordered immediate operations against the place. The unexpected surrender of Badajoz had been a severe blow, and he considered the recapture essential to his future operations, for he had formed the plan of advancing into the heart of Spain, and obliging the French to evacuate Andalucia. (Dispatch to Lord Liverpool, vii., p. 523.) But the possession of Badajoz not only protected the French positions in Andalucia and Estremadura, but gave them the key of the southern provinces of Portugal. While making the preparatory arrangements for the siege, Lord Wellington was recalled to the north by Massena's movements. On the 28th of April the British commander was back again, with his head-quarters at Villa Formosa, near the Coa.

Massena, having recruited his army at Salamanca to a certain extent, was anxious to throw provisions into Almeida. He had repeatedly applied for reinforcements, and, above all, provisions, in the most urgent manner to his brother marshal, Bessières, duke of Istria, who had been left by Napoleon's orders, in command of the north. Bessières however seems to have paid no great attention to these applications, for we find Massena writing to him from Ciudad Rodrigo on the 29th of April, when he was actually on his march to relieve Almeida, in the following terms:—"My dear Marshal, Orders are come to me inconceivable. To that of the 20th you tell me that you can give me no assistance. In that of the 22nd you tell me that, on the 25th or 26th, you will join me wherever I may be, and that the head of your column will be at Salamanca on the 26th. By your letter which I received to-day, you tell me that your cavalry and artillery were, on the 27th, still one day's march from Salamanca; and you conclude that my movement must be by this time at an end, and you say that you regret not having been able to co-operate in it. . . . I beg of you again to send without delay, and even to-day, to Ciudad Rodrigo, for the place has not fifteen days' provisions." (Napier, 'Peninsular War,' vol. iii. App. pp. 620-22.)

On the 2nd of May, Massena, having been joined at last by some cavalry, moved from Ciudad Rodrigo, and crossed the Agueda, with 40,000 infantry, 5000 horse, and about thirty pieces of artillery, for the purpose of relieving Almeida. He expected every day to be superseded in his command, and he wished to make a last effort for the sake of his own military character. Lord Wellington could muster no more than 32,000 men, of which force only 1200 were cavalry. He however determined to fight rather than give up the blockade of Almeida. He drew back his army half way between the Agueda and the Coa, and placed it in an extended line on a table-land between the two parallel rivers Turones and Das Casas, which are affluents of the Agueda, and which run left on Fort Conception, covering the blockade of Almeida; the centre opposite the village of Almeida; and the right at Fuentes de Oñoro, extending towards Nava d'Aver, on the road to Sabugal: the whole distance being nearly seven miles. He had the Coa in his rear, with the bridge of Castello Bom in case of a retreat. The front of the British position was protected by the river Das Casas, flowing through a deep ravine, in which lay the village of Fuentes de Oñoro; but to the right of this village the table-land turned back towards the Turones, leaving a plain between it and the hill of Nava d'Aver. The French advanced in three columns, one of which took post on a ridge which overhangs the village of Fuentes de Oñoro, and nearly parallel to that occupied by the Allies. They then attacked the village, which was stoutly defended by the British. The French at one time took possession of part of it, but were charged and driven out by a fresh brigade of British infantry. Night put an end to the fight. The Allies lost about 250 men, and the French somewhat more. The next

Digitized by Google

day, Massena, who had been joined by Besières with a body of the Imperial Guards, reconnoitered the position of the Allies; and on the 5th of May he made a grand attack with the greater part of his force on the British right, which he expected to turn by the plain which extends between the hill of Fuentes de Oñoro and that of Nava d'Avar, and between Poço Velho on the river Das Casas to the Turones, which last stream flowed in the rear of the British position. Had they passed the Turones, the French would have spread into the open country about Fresada, and cut off the English from the Coa. The French, crossing the Das Casas at Poço Velho, attacked the Spanish party of Julian Sanchez, and drove him from Nava d'Avar; but they then charged the 7th light division, which formed the British right. The light division immediately formed into squares; but the numerous French cavalry fell upon the 7th division before it could effect a like formation. The troops however stood firm; and although some were cut down, the enemy was checked by the steady fire of the Chasseurs Britanniques, a foreign regiment in the British service, and of the other regiments of the 7th division. Lord Wellington however, considering his position too far extended to the right, gave up Nava d'Avar and his communication with Sabugal, and ordered the 7th and light divisions to retire across the plain, and the 1st and 3rd divisions to wheel back and take up a new alignement on a steep ridge which runs from the Das Casas and Turones, nearly at right angles with the original position. The village of Fuentes de Oñoro thus became the left of the new position, and the plain was in Fresada, beyond the Turones, and between that and the Coa. This movement was well executed, though under very critical circumstances, for the British squares had to cross a vast plain, exposed to the charge of a numerous French cavalry supported by artillery, the British cavalry being too weak to give much protection. The non-combatants, who had gathered behind the British line, were hurrying away, driven by the French horsemen across the plain. Colonel Napier says that "in all this war there was not a more dangerous hour for England. The whole of the vast plain, as far as the Turones, was covered with a confused multitude, amidst which the squares appeared but as specks; for there was a great concourse, composed of commissariat followers of the camp, servants, baggage, led horses, and peasants attracted by curiosity, and finally the broken pigmets and parties coming out of the woods. The 7th division was separated from the army by 5000 infantry; 5000 French cavalry, with fifteen pieces of artillery, were close at hand impatient to charge; the infantry of the 8th corps was in order of battle behind the horsemen; the wood was filled with the skirmishers of the 6th corps; and if the latter body, pressing upon the British, had issued forth, while Drouet's divisions fell on that village, while the 8th corps attacked the light division, and while the whole of the cavalry made a general charge, the loose multitude encumbering the plain would have been driven violently in upon the 1st division, in such a manner as to have intercepted the latter's fire, and broken their ranks. No such effort however was made; Montbrun's cavalry merely hovered about Craufurd's squares, the plain was soon cleared, the cavalry took post behind the centre, and the light division formed a reserve to the right of the 1st division, sending the table-land on the top of the rocks to connect it with the 7th division, which had arrived at Fresada, and was there joined by Julian Sanchez. At the sight of this new front, so deeply lined with troops, the French stopped short and commenced a heavy cannonade, which did great execution, from the closeness of the allied masses; but the British artillery replied with vigour, and the violence of the enemy's fire abated: their cavalry then drew out of range, and a body of French infantry attempting to glide down the ravine of the Turones, was repulsed by the riflemen and light companies of the Guards. But all this time a fierce battle was going on at Fuentes de Oñoro. Massena had directed Drouet to carry this village at the very moment when Montbrun's cavalry should turn the right wing. It was, however, two hours later ere the attack commenced. The three British regiments (24th, 71st, and 79th) made a desperate resistance; but, overmastered in number, and little accustomed to the desultory fighting of light troops, they were pierced and divided: two companies of the 79th were taken, Colonel Cameron was mortally wounded, and the lower part of the town was carried: the upper part however was still held, and the rolling of the musketry was incessant. Had the attack been made earlier, and the whole of Drouet's division thrown boldly into the fight, while the 6th corps, moving through the wood, closely turned the village, the passage must have been forced, and the left of the new position outflanked; but Lord Wellington having all his reserves in hand, detached considerable masses to the support of the regiments in Fuentes. The French continued also to reinforce their troops, until the whole of the 6th corps and a part of Drouet's division were engaged, when several turns of fortune occurred. At one time the fighting was on the banks of the river, and amongst the lower houses; at another upon the lower heights and round the chapel, and some of the enemy's skirmishers even penetrated completely through towards the main position: but the village was never entirely abandoned by its defenders; and in a charge of the 71st, 79th, and 88th regiments, led by Colonel M'Kinnon, against a heavy mass which had gained the chapel eminence, a great number of French fell. In this manner the fight lasted until evening, when the lower part of the town was abandoned by both parties—the British maintaining the chapel and crags, and the French retiring a cannon-shot from the stream. ("History of the Peninsular War," iii. 114-116.)

The total loss of the British was 235 killed, 1234 wounded, and 317 missing or taken prisoners. The loss of the French was certainly greater, judging from the number of dead bodies found in the village. No fighting of any consequence occurred on the left of the British position, where the fifth and sixth divisions were posted to protect the blockade of Almeida, the second corps of the French merely waiting the issue of the battle at Fuentes de Oñoro, and watching for an opportunity of throwing provisions into Almeida, which however did not occur. The battle of Fuentes de Oñoro was of importance, being a regular pitched battle fought by the British in a position of no particular strength, and indeed very weak in one point, under great disadvantage of numbers, and especially of cavalry. The great majority of the troops engaged were British, for the Portuguese were mostly with Marshal Beresford in the south. There were only four British divisions and one Portuguese brigade and about 1000 cavalry engaged against three French corps of infantry and 5000 cavalry. Massena fought the battle for the purpose of relieving Almeida, but he failed, and Almeida a few days afterwards was evacuated by the French garrison in the night. With this battle Massena closed his long and active career. He withdrew his army beyond the Agueda, and soon afterwards Marshal Marmont, duke of Ragusa, arrived at Salamanca to supersede him. The order of Napoleon by which Massena was directed to give up the command to Marmont was not conveyed in very gracious terms. He was allowed to take with him to France his son and one of his aides-de-camp only. Marmont was told to take the reins of command with a firm hand. (Napier, 'Peninsular War,' vol. iii., Appendix vii., p. 622.)

While all these things were happening in the north, Marshal Beresford had invested Badajos, when Soult marched from Seville to relieve that place. On the 13th of May, Beresford raised the siege, removed his artillery, platforms, and stores, and prepared to meet Soult in position on the ridge of Albuera with above 7000 British infantry, several Portuguese brigades, and Blake's Spanish corps, in all about 30,000 infantry and about 2000 cavalry, but hardly one-half of this force could be depended upon in the field. He had with him thirty-eight pieces of artillery. On the evening of the 15th Soult came up with about 24,000 chosen infantry, about 6000 cavalry, and fifty guns. He immediately reconnoitred Beresford's position, and determined upon an attack on the right flank of the Allies, which was their weak point, though Beresford had directed his chief attention to the centre, where he had placed his British troops. He was on the French part the same game as at the battles of Talavera and Fuentes; but Wellington was not there, nor were British troops at hand all along the line; and when Beresford, perceiving his mistake, ordered Blake to change his front so as to face the French marching upon his right, Blake refused, saying that the real attack was against the centre by the bridge of Albuera. There was indeed an attack by the French in that quarter, but it was only intended to mask and support the grand attack on the right of the Allies. It was only when the French actually appeared on the table-land on the right, commanding and enfilading the whole position of the Allies, that Blake consented, with much slowness, to change his front. In the mean time the French columns were already in possession of the table-land: their guns opened, and their cavalry outflanking the front, put the Spaniards in disorder, and they gave way. The brigades of the second division, British, were ordered to advance to the right; the first, or Colborne's brigade, while in the act of deploying, was attacked in flank and rear, and nearly destroyed by the French and Polish cavalry: the next, Houghton's brigade, reached the summit, and maintained a desperate struggle. But the men fell fast, ammunition failed, and Beresford began to think of a retreat, which would have been ruinous, when, at the suggestion of Colonel Hardinge, General Cole, with the 4th division, was ordered to march up the hill. It consisted of only two brigades, one Portuguese and the English Fusilier brigade (7th and 23rd regiments), commanded by Sir William Myers. This last brigade restored the fight and saved the army. General Cole directed the Portuguese brigade under General Harvey to move round the hill on the right, whilst Abercrombie's brigade, the last remaining one of the second division, moved up the hill on the left; Cole himself led the brave fusiliers up the fatal hill, which was crowned by the French masses and artillery. Six British guns were already in the enemy's possession, the whole French reserve was coming forward to reinforce their front column, and when the remainder of Houghton's brigade could no longer maintain its position. The ground was heaped with dead bodies, and the Polish lancers were riding furiously about the captured artillery on the upper part of the hill. General Cole at the head of the fusiliers, flanked by the battalion of the Lusitanian Legion under the colonel Hawker, dispersed the lancers, recovered the captured guns, and appeared on the right of Houghton's brigade exactly as Abercrombie's issued out on the left. We must now once more borrow Sir William Napier's eloquent pen:—"Such a gallant line, issuing from the midst of the smoke, and rapidly separating itself from the confused and broken multitude, startled the enemy's heavy masses, which were increasing and pressing onwards as to an assured victory: they wavered, hesitated, and then, vomiting forth a storm of fire, hastily endeavoured to enlarge their front, while a fearful discharge of grape from all their artillery

Digitized by Google

whistled through the British ranks. Sir William Myers was killed, Cole, and the three colonels, Ellis, Blakeney, and Hawkshawe, fell wounded, and the fusilier battalions, struck by the iron tempest, reeled and staggered like sinking ships. Suddenly and acerly recovering, they closed on their terrible enemies, and then was seen with what a strength and majesty the British soldier fights. In vain did Soult, by voice and gesture, animate his Frenchmen; in vain did the hardiest veterans, extricating themselves from the crowded columns, sacrifice their lives to gain time for the mass to open out on such a fair field; in vain did the mass itself bear up, and, fiercely arising, fire indiscriminately upon friends and foes, while the horsemen, hovering on the flank, threatened to charge the advancing line. Nothing could stop that astonishing infantry. No sudden burst of undisciplined valour, no nervous enthusiasm, weakened the stability of their order; their flashing eyes were bent on the dark columns in their front; their measured tread shook the ground; their dreadful volleys swept away the head of every formation; their deafening shouts overpowered the dissonant cries that broke from all parts of the tumultuous crowd, as foot by foot, and with a horrid carnage, it was driven by the incessant vigour of the attack to the farthest edge of the hill. In vain did the French reserves, joining with the struggling multitudes, endeavour to sustain the fight; their efforts only increased the irremediable confusion, and the mighty mass, giving way like a loosened cliff, went headlong down the south face of the hill, bowed after in unison, discoloured with blood, and 5000 unwounded men, the remnant of 6000 unconquerable British soldiers, stood triumphant on the fatal hill." (Napier, 'Peninsular War,' iii., 540-1.)

The day was now won, and Beresford ordering the Portuguese and Spaniards to advance, the French retreated in confusion across the small river on which stands the village of Albuera. About three o'clock the fire had ceased. The allied army had lost in killed and wounded about 7000 men, of whom two-thirds were British. The French lost about 8000 men, including two generals killed and three wounded. On the 16th of May the two armies remained in their respective positions, and Beresford waited in anxiety for another attack, when he had hardly British soldiers enough for his pickets and to take care of the crowd of wounded. On the 17th however he was reinforced by an Inglish brigade, and the following night Soult retired towards Seville, leaving 800 soldiers severely wounded to the generosity of the English. On the 19th Lord Wellington arrived from the north, followed by two fresh divisions, and gave directions to resume the seige of Badajos. The trenches were opened, and on the 5th of June, a breach being made in Fort St. Christoval, the assault was given, but failed. On the 9th another attempt at storming was made, which proved equally fruitless. On the 10th Lord Wellington received intelligence that Marmont was marching to the south to join Soult. He then took up a position near Campo Mayor to watch the frontiers of Portugal. The enemy did not choose to attack him, and about the middle of July, Marmont, again separating himself from Soult, recrossed the Tagus by Almaraz, and marched on Salamanca. Lord Wellington likewise, leaving General Hill with one British division and the Portuguese in Alemtejo, and giving up the siege of Badajos for the present, crossed the Tagus with the remainder of his army, and fixed his head-quarters at Fuente Guinaldo, on the line of the Agueda. He was looking towards recovering possession of the important fortress of Ciudad Rodrigo, which his enemies had surrounded and kept in a state of blockade. Towards the end of September, Marmont, having received large reinforcements from France, moved upon the Agueda, and by his superiority of numbers and especially of cavalry, obliged Wellington, after a partial engagement at El Bodon, to withdraw his army, which he did in excellent order to his old position on the Coa, where Marmont did not choose to follow him. Nothing more happened after this on that side for the remainder of the year 1811.

In the south, General Hill effected a gallant achievement by surprising the French General Girard, with 4000 foot and 1000 horse, at Arroyos de Molinos, in the neigbourhood of Caceres, in Spanish Estremadura, on the 28th of October. Hill completely routed Girard, took 1500 prisoners, with several officers of rank, and the whole of the enemy's artillery, ammunition, stores, and baggage, with only a trifling loss on the part of the Allies. Hill then advanced to Merida, where he placed his troops in cantonments, that part of Estremadura being thus delivered from the enemy.

Lord Wellington, in the second part of 1811, besides having firmly established his complete possession of Portugal, had by his operations within the Spanish frontiers, both north and south of the Tagus, given full employment to two French armies, each commanded by a French marshal of high reputation, and prevented them from acting with vigour either against Galicia in the north or against Cadiz in the south. He had thus fulfilled the promise which he had made the year before of being able to retain possession of Portugal, and to make it a position of support for future operations against the French in Spain, and he continued to hold the same language to ministers at home. ('Dispatches,' March 23, 1811, vii., p. 392.)

In eastern Spain unfortunately the French had obtained in 1811 great successes against the unassisted Spaniards. They took Tarragona by storm in June, when a horrid butchery of the unarmed population took place, without regard to age or sex, to the number, it was stated, of 6000. Still the brave Catalonians, undismayed, continued to carry on the war with unabated zeal. The Spanish General Blake, after being defeated by Suchet near Valencia, shut himself up in that city with his whole army, the last Spanish army which had remained in the field; and in the beginning of January 1812, he capitulated with 18,000 soldiers, 23 general officers, and between 300 and 400 guns. "I believe," observed Lord Wellington, at the time, "there is no man who knows the state of affairs in that province, and has read Suchet's account of his action with Blake on the 25th of October, who does not believe that, if Blake had not fought that action, Valencia would have been safe. Are the English ministers and generals responsible for the blunders of Blake?" ('Dispatches,' viii., p. 520.)

Campaign of 1812.—Lord Wellington from his head-quarters at Frenada, near the Coa, where he had been apparently quiet during the latter months of 1811, had been preparing in secrecy the means of recapturing the important fortress of Ciudad Rodrigo. Under the appearance of repairing and fortifying Almeida he had collected there a battering train and abundant stores. A portable bridge on trestles was also constructed in the same place. He also effected the formation of a commissariat waggon-train, with several hundred waggons constructed for that purpose, in order to supercede the rude carts of Portuguese construction which had been hitherto used as a means of transport for the army, but which would have often proved quite inadequate without the assistance of a large body of Spanish mules and muleteers, which followed all the movements of the divisions of the British army. By the exertions of the engineer officers the river Douro had been rendered navigable as far as the confluence of the Agueda, that is to say, forty miles higher than boats had ever before ascended it. All this was done with so little outward bustle and show that Marmont does not seem to have anticipated any attack upon Ciudad Rodrigo, at least for the remainder of the winter. The French marshal had placed his army, the 'Army of Portugal,' in extensive cantonments about Placencia and Talavera, towards the Tagus, and had detached part of it to the eastward towards La Mancha, and two divisions to the north, to occupy Asturias. Suddenly, Lord Wellington, on the 6th of January 1812, moved his head-quarters forward to Gallegos, and on the 8th part of the army crossed the Agueda, and immediately invested Ciudad Rodrigo. An exterior redoubt, on a hill called the Great Teson, was stormed by a party of the light division that very evening, and the first parallel was soon afterwards established. On the night of the 13th the fortified convent of Santa Cruz, situated outside of the walls, was surprised and carried; and on the 14th the convent of San Francisco, likewise situated outside the walls, was carried by assault. The second parallel was then completed, and fresh batteries being established, two practicable breaches were made on the 19th, and that very evening orders were given to storm the place. No time was to be lost, as Marmont was known to be advancing to relieve the garrison. A part of the light division under General Craufurd, on one side, and General Mackinnon's brigade, supported by the 94th and 5th regiments, on the other, advanced to the breaches, whilst Colonel Pack's brigade attacked the gate of St. Jago, and in less than half an hour from the time the attack commenced the Allies were in possession of the ramparts, and the garrison then surrendered. (Dispatches to Lord Liverpool, vol. viii., p. 549, &c.) The loss of the British was severe. General Mackinnon and many of his men were beaten up by the explosion of a magazine in the convent, which took fire accidentally. General Craufurd, the gallant commander of the light division, was mortally wounded, and died shortly afterwards. General Vandeleur and Colonel Colborne were also wounded, as well as Major George Napier, who led the storming party on the left. The total loss of the British and Portuguese amounted to about 1500 killed and wounded. The loss of the garrison was estimated at about the same, besides 1700 prisoners. A large battering-train and a vast quantity of ammunition and stores were found in the place.

Marmont heard of Ciudad Rodrigo, on the 15th of January, of Lord Wellington's operations against Ciudad Rodrigo. He quickly recalled Bonet's division from Asturias, collected his other divisions, and marched, as he thought, to relieve the place; but on arriving at Salamanca he heard of its fall. His astonishment was thus expressed in a letter to Berthier:—"On the 16th the English batteries opened their fire at a great distance: on the 19th the place was stormed, and fell into the power of the enemy. There is something so incomprehensible in this that I allow myself no remarks, as I am not yet furnished with the necessary information."

The Spanish Cortes assembled at Cadiz passed unanimously a vote of thanks to Lord Wellington, and conferred on him the title of Duke of Ciudad Rodrigo. In England he was raised to the dignity of Earl of Wellington of the United Kingdom, and parliament, besides a grant of land to him and his brave army, annexed to the title an annuity of 2000*l.*

Having repaired in some degree the works of Ciudad Rodrigo, Lord Wellington placed it under the command of a Spanish governor, and prepared to move to the south, for he had made up his mind to take Badajoz, if possible, before Marmont and Soult could unite for its defence. The artillery for the siege was embarked at Lisbon for a fictitious destination, then transhipped at sea into small craft, in which it was conveyed up the Setubal river to Alcacer do Sul, and thence by land across Alemtejo to the banks of the Guadiana. On

Digitized by Google

the 6th of March, leaving one division on the Agueda, Lord Wellington marched the remainder of his army to the south. On the 16th the army crossed the Guadiana, and Badajoz was immediately invested, while several divisions advanced to Llerena and Merida to cover the siege. On the 25th, the Picurina, an advanced post, separated from the body of the place by the small river Rivillas, was taken by storm, and on the 26th two breaching batteries opened their fire on the town. In the meantime Soult was collecting his disposable force at Seville for the relief of the place, and Marmont, in order to effect a diversion, entered Portugal by Salugal and Penamacor, and ravaged the country east of the Serra de Estrella. Lord Wellington accelerated the operations of the siege. On the 6th of April, three breaches having become practicable, orders were given for the assault in the evening. The various divisions passed the glacis under a tremendous fire from the garrison, which greatly thinned their ranks; and they descended into the ditch, and ascended the breaches, but here they found obstacles which appeared insuperable. Planks studded with iron spikes, like harrows, and chevaux-de-frise formed of sword-blades, effectually stopped the way, and the ramparts and neighbouring buildings were occupied by light infantry, which showered their volleys upon the assailants. Shells, hand-grenades, every kind of burning composition, and missiles of every sort, were hurled at them. At last Lord Wellington ordered them to withdraw just as a report came that General Picton's division had been driven from the breaches, and soon afterwards General Walker's brigade also entered the town by escalade on the side of the Olivença Gate. The other divisions then formed again for the attack of the breaches, when all resistance ceased. The French governor, General Philippon, with a few hundred men, escaped across the Guadiana to Fort St. Christoval, where he surrendered the following morning. Great excesses and outrages were committed by the soldiers during the remainder of the night, until severe measures on the part of Lord Wellington restored order. The loss of the Allies was much more severe than at Ciudad Rodrigo, amounting to 5,000 officers and 963 men killed; and 306 officers and 3480 men wounded. "When the extent of the night's havoc," says Napier, "was made known to Lord Wellington, the firmness of his nature gave way for a moment, and the pride of conquest yielded to a passionate burst of grief for the loss of his gallant soldiers."

Soult collected his army at Villafranca, between Llerena and Merida, on the 8th, when, hearing of the fall of Badajoz, he retired before daylight next day towards Seville, pursued by the British cavalry, which made a successful attack on his rear-guard at Villa Garcia.

On the 13th of April Lord Wellington moved the main body of his army back to the north, leaving General Hill south of the Tagus. Marmont, on hearing of this, gave up the blockade of Almeida and Ciudad Rodrigo, and withdrew to Salamanca. Lord Wellington's head-quarters were again at Gallegos, between the Coa and the Agueda, where they remained till the middle of June, nothing of importance occurring in that quarter during the interval. In the south however General Hill took and destroyed, in the month of May, the forts which the French had constructed at Almaraz on the Tagus, where they had a bridge of boats to secure the communication between the Armies of the North and South.

On the 13th of June Lord Wellington, having completed his preparations for an advance into Spain, broke up from his cantonments with about 40,000 men, leaving General Hill on the Tagus, near Almaraz, with about 12,000 more. On the 17th he appeared before Salamanca. Marmont retired on his approach, and left about 800 men in some forts constructed on the ruins of convents, which commanded the bridge across the river Tormes. The allied army forded the river and entered the town, to the great joy of the inhabitants. "They have now been suffering for more than three years, during which time the French, among other acts of violence and oppression, have destroyed 13 out of 25 convents, and 22 of 25 colleges, which existed in this celebrated seat of learning." ('Dispatches,' ix. p. 239.) The forts were immediately invested, while Marmont's army retired to Toro on the Douro, and the British advance took up a position at St. Cristoval, a few miles in front of Salamanca. An attempt was made to carry the forts by escalade, which failed, and Major-General Bowes and 120 men fell in the attack. On the 20th Marmont moved forward again, and, arriving in front of the position of St. Cristoval, made a demonstration with his cavalry in the plain, but it ended merely in a skirmish. He made other demonstrations and movements in the following days for the purpose of relieving the forts, but was baffled by the watchfulness of the British general, until on the 27th the forts within Salamanca were taken or surrendered.

Marmont again retired to the Douro in the beginning of July, and took up a strong position on high ground along the northern bank of the Douro, his centre being at Tordesillas. The British and Portuguese allied army took up a line on the left or southern bank of the river, facing the enemy. A great deal of manœuvring, marching, and counter-marching, and changing of front, followed on the part of Marmont, during which the French marshal was reinforced by Bonet's division from Asturias, which had effected a difficult march over the mountains, having been harassed and pressed by the Spaniards from Galicia under Mahy and Porlier. On the 16th of July Marmont threw two of his divisions across the Douro at Toro, when Lord Wellington moved his army to the left, to concentrate it on the Guarela, an affluent of the Douro from the south. On the night of the 16th the French, recrossing the Douro at Toro, ascended the northern bank of the river with their whole army to Tordesillas, when they again crossed over to the southern bank, and by a forced march assembled at Nava del Rey on the 17th. On the 18th they attempted to cut off the right of the British army, consisting of the 4th and light divisions, but were repulsed by several charges of the British and Hanoverian cavalry, as well as of the British and Portuguese infantry. By his manœuvres however Marmont succeeded in establishing his communication with King Joseph and the army of his centre, which was advancing from Madrid to join him. In the mean time the two armies of Marmont and Wellington were in line on the opposite banks of the Guarela. More manœuvring took place on the part of Marmont, who, on the 20th, crossed the Guarela on the right of the Allies, and advanced towards the Tormes by Babilafuente and Villamuel. Lord Wellington followed closely the enemy's movements during part of that day's march, and the two hostile armies moved in parallel lines within half cannon-shot of each other in the finest order; and as the nature of the ground gave either party a temporary advantage the one took advantage of it, but no actual collision took place, though both armies were ready to form in line of battle. Lord Wellington, in his dispatch to Earl Bathurst dated the following day, July 21, observes as follows:—"The enemy's object hitherto has been to cut off my communication with Ciudad Rodrigo, the want of which he knows would distress us very materially. The wheat-harvest has not yet been reaped in Castile, and even if we had money we could not now procure anything from the country, unless we should take the example of the French, and lay waste whole districts in order to procure a scanty subsistence of unripe wheat for the troops. It would answer no purpose to attempt to retaliate upon the enemy, even if it were practicable. The French armies in Spain have never had any secure communication beyond the ground which they occupy; and however distressed the enemy opposed to me may be now for want of provisions and supplies of every description that I have, ... I have invariably been of opinion that, unless forced to fight a battle, it is better that one should not be fought by the allied army unless under such favourable circumstances as that there would be reason to hope that the allied army would be able to maintain the field of battle after that of the enemy should not. Your lordship will have seen by the returns of the two armies that we have no superiority of numbers even over that single army immediately opposed to us; indeed I believe that the French army is of the two the strongest, and it is certainly equipped with a preponderance of artillery double ours in number, and of larger calibres. It cannot therefore be attacked in a chosen position without considerable loss on our side. To this circumstance add, that I am quite certain that Marmont's army is to be joined by the King's, which will be 10,000 or 12,000 men, with a large proportion of cavalry, and that troops are still expected from the army of the north, and some are ordered from that of the south; and it will be seen that I ought to consider it almost impossible to remain in Castile after an action, the circumstances of which should not have been so advantageous as to have left the allied army in a situation of comparative strength while that of the enemy should have been much weakened. I have therefore determined to cross the Tormes if the enemy should; to cover Salamanca as long as I can, and above all not to give up our communication with Ciudad Rodrigo; and not to fight an action unless under very advantageous circumstances, or it should become absolutely necessary." ('Dispatches,' ix. pp. 296-98.)

On the 21st both hostile armies crossed the Tormes—the Allies by the bridge of Salamanca, and Marmont's higher up the river by the fords between Huerta and Alba de Tormes. Lord Wellington placed his troops in a position, the left of which rested on the left or southern bank of the river, and the right on one of two steep hills which from their similarity and contiguity are called the Dos Arapiles. On the morning of the 22nd some sharp skirmishing took place, and the French succeeded in gaining possession of the more distant Arapiles, by which they had it in their power to annoy and perhaps turn the right of the British, Marmont's plan being evidently to cut them off from Ciudad Rodrigo. This obliged Lord Wellington to extend his right to a height behind the village of Arapiles, occupying the village itself with the light infantry. After a variety of evolutions and movements on the part of Marmont, which lasted till two o'clock in the afternoon, the French commander, under cover of a very heavy cannonade, "extended his left, and moved forward his troops apparently with an intention to embrace, by the position of his troops and by his fire, our post on that of the Two Arapiles which we possessed, and from thence to attack and break our line, or at all events to render difficult any movement of ours to our right. The extension of his line to his left however, and its advance upon our right, notwithstanding that his troops still occupied very strong ground, and his position was

Digitized by Google

well defended by cannon, gave me an opportunity of attacking him, for which I had long been anxious." (Dispatch to Earl Bathurst, July 24.) Lord Wellington's anxiety is explained by the intelligence which he had received that General Clausel had arrived at Pollos, on the Douro, on the 20th, with the cavalry and horse-artillery of the army of the north, to join Marmont, which he was expected to do on the 22nd or 23rd at the latest. This junction would give Marmont such a superiority in cavalry as greatly to embarrass and endanger the movements of the British.

Lord Wellington, suddenly seizing the opportunity for which he had been waiting, disposed his divisions so as to turn the enemy's left and at the same time attack him in front. General Pakenham, at the head of the third division, steadily ascended the ridge occupied by the extreme left of the French, formed line across their flank, and, being supported by some cavalry, he moved on towards the centre of the enemy, driving everything before him. Wherever the French attempted to make a stand they were charged with the bayonet; the cavalry at the same time charged the enemy in front, and the whole left wing of the French made a disorderly retreat towards their right, leaving many killed and wounded behind, and about 3000 prisoners. Meantime the 4th and 5th divisions, after a very severe struggle, succeeded in driving in the centre of the enemy, whose right however remained unbroken, when General Clausel, who having joined the French army that day, succeeded to the command in consequence of Marshal Marmont being wounded, withdrew his troops with great skill, and formed them in a new position nearly at right angles with the original one. His cavalry was numerous, and his artillery formidable. Lord Wellington directed a fresh attack, and the British line ascending to the enemy's position under a sweeping fire of artillery and musketry, gained the level ground, when they charged with the bayonet, and the 4th division coming up at the same time the French abandoned the ground in great confusion, retreating towards Alba de Tormes, followed closely by the British till night stopped the pursuit, which was renewed by the cavalry on the morning of the 23rd. The cavalry came up with the French rear near La Serna, when three French battalions surrendered, being forsaken by their own cavalry. Clausel retired by Peñaranda to Arevalo, where he took the direction road of Valladolid. The loss of the French was very severe; three generals killed, four wounded; one general, six field-officers, 130 officers of inferior rank, and between 6000 and 7000 men taken prisoners, besides two eagles. Their total loss in killed and wounded could not be ascertained. The British had 664 killed and 4270 wounded; but the proportion of officers was very great. General Le Marchant was killed and Generals Beresford, Leith, Cole, Cotton, and Spry were wounded.

The ultimate though not immediate results of the victory of Salamanca were great, and a French historian, generally very severe upon the cause of Napoleon, does not hesitate to attribute to the military and political consequences of that battle the ultimate loss of Spain by the French. (Thibaudeau, 'Histoire de l'Empire,' ch. 83.) Among the political consequences must be reckoned the obliteration of any tendency that there might have been in the minds of some of the influential men in Spain, and even in the Cortes, to give up the English alliance, and make their peace with King Joseph, on condition of his acknowledging the constitution proclaimed by the Cortes assembled at Cadiz in March of that year. The author just quoted says, "We are assured that a negociation to that effect had been entered into, which the battle of Salamanca broke off for ever."

Lord Wellington, having crossed the Douro, reached Valladolid on the 30th of July, Clausel continuing his retreat towards Burgos. King Joseph, with all the forces he could muster at Madrid, about 20,000, had marched by the Escurial on the 21st of July to join Marmont. On arriving at Arevalo he heard of Marmont's defeat, upon which he marched by his right to Segovia to effect a diversion in favour of Clausel's retreating army. Lord Wellington, recrossing the Douro, marched against him on the 7th of August, leaving a force on the Douro to watch Clausel. King Joseph retreated to Madrid, and the Allies having passed the Guadarama, he abandoned the capital and withdrew to the left bank of the Tagus, between Aranjuez and Toledo. Lord Wellington entered Madrid on the 12th, and was received with great acclamations. In consequence of this movement Soult raised the blockade of Cadiz, destroying the works which the French had constructed with so much labour and expense, and, abandoning western Andalucia, concentrated his forces in Granada. His rear-guard was attacked by an allied Spanish and English force from Cadiz, which drove it from San Lucar, and took Seville by assault. General Hill at the same time advanced from the banks of the Guadiana to the Tagus, connecting his operations with those of the main body of Lord Wellington's army. On his side King Joseph abandoned Toledo and fell back to Almansa, in Murcia, to keep himself in communication with Soult and Suchet. A great part of southern and central Spain was thus freed from the French, who never retook Seville; and this was another result of the battle of Salamanca.

The situation of Lord Wellington at Madrid was however critical. Clausel's army in the north had been largely reinforced, and Soult, and Suchet, and King Joseph, by forming a junction, might advance from the south, and thus the Allies would be attacked by a combined force nearly treble in number to their own. The Anglo-Sicilian expedition of merely 6000 men, part of whom were foreign auxiliaries,

was cooped up in Alicante, and could not effect any powerful diversion. There was no Spanish force of any magnitude upon which Lord Wellington could depend for field operations. The Galician army under Santocildes, which was the most effective Spanish corps, after taking Astorga, had advanced towards Zamora, but was driven back by Clausel. Ballasteros, who commanded a Spanish force in Andalucia, refused to be directed by Lord Wellington, and O'Donnell had been defeated in Valencia by Suchet, and driven into Murcia. At Madrid Lord Wellington was treated with enthusiastic admiration, but no active exertions were made in the common cause. The country was exhausted, the people appeared disheartened, and the British commander-in-chief could not realise at Madrid, upon drafts on the British treasury, a sum of money adequate to his most pressing wants. To remain at Madrid was therefore impracticable; and the ulterior advance to the north against Clausel, or to the south against Soult, and he determined on the first of those movements, for the purpose of striking a blow at Clausel before the French in the south and east could advance to his support. Leaving two divisions at Madrid, he marched with the remainder on the 1st of September for Valladolid, which he entered on the 7th, and, continuing his march towards Burgos, was joined at Palencia by the Spanish army of Galicia, which scarcely mustered 10,000 men, undisciplined and deficient in equipment. On the 19th the allied army entered Burgos, and the French, under General Souham, who had assumed the command in the room of fell back to Briviesca, leaving 2000 men, under General Dubreton, in the Castle of Burgos, strong by its position, which had been fortified with care. The possession of that fort was necessary for the security of the allied army in its present advanced and insecure position, and Lord Wellington directed it to be invested forthwith, though he was ill furnished with siege-artillery. A horn-work on a hill, which commanded several of the works of the castle, was carried by assault. The fort itself was battered, but with little effect, and sapping was then resorted to. On the 23rd, a practicable breach in the outer wall by the explosion of a mine, an attempt was made to storm it, but failed. Another breach was effected in like manner on the evening of the 4th of October, and, being stormed with success, the besiegers established themselves within the exterior line of the works of the castle. The garrison made two sorties, by which they materially injured the works of the Allies, and occasioned them great loss. Want of ammunition greatly retarded the operations of the siege. A breach at last being effected, by mining, in the second line on the 18th, orders were issued for storming it. A detachment of the King's German Legion carried the breach, and a detachment of the Guards succeeded in escalading the line; but the enemy brought such a fire upon them from the third line and from the body of the castle, and attacked them with such numerous and superior bodies that they supported, that they were obliged to retire with considerable loss. But now the French army of the north advanced with evident intention to raise the siege; and at the same time Lord Wellington learnt from General Hill that the armies of the south and centre, which, being united, mustered 70,000 effective men, were advancing from Valencia towards the Tagus, and that the Spanish General Ballasteros had not assumed a position in La Mancha, which the Spanish Government, at Lord Wellington's suggestion, had directed him to take in order to intercept the enemy's movements. The British commander was therefore under the necessity of abandoning the siege of Burgos, and of effecting a retrograde movement in order to draw near to General Hill, who at the approach of Soult abandoned Madrid and retired slowly towards Salamanca.

On the 21st of October the siege of Burgos was raised, and Lord Wellington's army retired in good order towards Salamanca, and by a brigade from England under Lord Dalhousie, which had landed at Coruña. The French, under Souham, repeatedly attacked the rear-guard of the Allies until they reached the Doero at Tudela, when Souham halted, waiting to be joined by Soult from the south. Lord Wellington continued his retreat to the Tormes, being joined on the 3rd of November by General Hill. On the 8th of November the Allies took up their old position on the heights of San Cristoval, in front of Salamanca. On the 10th, Souham and Soult joined their forces at Alba de Tormes, and amounted to 75,000 men and 12,000 cavalry, while Lord Wellington's army did not exceed 48,000 infantry and 5000 cavalry. On the 14th the French crossed the Tormes in force near Lucinas. Lord Wellington took position at the Arapiles, being the ground of his former victory; but as the enemy, through his superiority of numbers, and especially of cavalry, was in motion to intercept his communications with Ciudad Rodrigo, he withdrew to the Agueda, and on the 18th his head-quarters were at Ciodad Rodrigo. Soult did not follow him close: in fact, the French made no serious movement beyond the Tormes, and soon afterwards they began withdrew a great part of their army from the banks of that river, to place them in better cantonments in Castile. The main army of the British and Portuguese were distributed in their old quarters within the frontiers of Portugal, their left resting at Lamego on the Douro, whilst General Hill's corps moved into Spanish Estremadura into cantonments, near Coria, and towards the Tagus, placing strong posts at the passes of Baños and Bejar. The campaign of 1812 was now terminated.

During the retreat from Burgos the allied troops suffered much fatigue and privation; the weather was very inclement, the roads were deep and miry, and the rivers were greatly swelled, and some of them

Digitized by Google

were breast-high at the fords. Owing to the irremediable difficulty of obtaining provisions in Spain, a great part of the army had neither bread nor biscuit, and the men had only a ration of lean tough beef, which they could not cook, but heated upon such smoky fires as they could make, and so ate it half raw. Many irregularities were committed by the soldiers, which Lord Wellington severely reprobated in a circular letter which he addressed to all commanding officers of divisions and brigades, dated Frenada, 28th of November 1812. ('Dispatches,' ix., p. 582.)

When the news reached England of the victory of Salamanca, Lord Wellington was advanced in the peerage by the title of Marquis of Wellington, Aug. 18, 1812. On the 3rd of December he received the thanks of parliament, and on the 7th of the same month the sum of 100,000*l.* was voted to him as a reward for his services, and to enable him to support with dignity the rank to which he had been elevated.

Campaign of 1813.—Napoleon, having lost the best part of his army in his Russian expedition of 1812, not only could not reinforce his marshals in Spain, but thought it advisable to recall Marshal Soult, at the beginning of 1813, in order to intrust him with a command in the approaching campaign against the Russians and Prussians in Germany. Soult however only took about 20,000 men with him from the Peninsula. The French had still about 70,000 to oppose to Lord Wellington, independent of the force under Suchet in eastern Spain. The army still called 'the army of the centre,' under General Jourdan, had its head-quarters at Valladolid; that of the centre, under Drouet, was distributed round Madrid; and the head-quarters of the army of the south, formerly Soult's, were at Toledo. All these forces were under King Joseph, who was assisted by Marshal Jourdan. Clausel and Foy commanded separate divisions in Navarre and Biscay. Andalucia and Estremadura were free from the French, as well as Galicia and Asturias in the north.

Lord Wellington had been at last appointed by the regency of Spain, with the approbation of the Cortes, to the rank of commander-in-chief of the Spanish armies, and measures were taken to render the Spanish troops more effective than they had hitherto been. But the army upon which he could immediately rely for field operations consisted of about 65,000 infantry, British and Portuguese, and about 6000 cavalry. With this force he opened the campaign of 1813.

About the middle of May Lord Wellington broke up from his Portuguese cantonments, and put his army in motion for Spain in three bodies, the left under Sir Thomas Graham, the right under General Hill, and the centre under his own immediate command. He directed General Graham to pass by Lamego to the north of the Douro, and march through Tras-os-Montes to Bragança and Zamora, and thence to Valladolid, thus securing the position which the French had taken and had been at great pains to strengthen, along the northern bank of the Douro. The French were taken by surprise, not expecting this movement through Tras-os-Montes. Graham reached the Esla, an affluent of the Douro from the north, without meeting an enemy. On the 1st of June, having crossed the Esla, he encamped near Zamora, the French retreating before him, and, being joined by Lord Wellington from Salamanca, they moved on towards Valladolid. General Hill having crossed the Douro at Toro on the 3rd of June, joined the rest of the allied army, which was likewise joined by the Spanish army of Galicia, and afterwards by another Spanish corps from the south under O'Donnell. The French at Madrid and Toledo, disconcerted by this rapid march of the Allies, and fearing to be cut off from their countrymen in the north, hastily quitted the capital with King Joseph, his court, and retainers, and crossed the Douro at Puente, when the united French army retired to Burgos. On the 12th of June, the Allies continuing their advance, the French abandoned Burgos, destroying the defences of the castle, and retreated by Briviesca to the Ebro, which was the line they intended to defend. They threw a garrison into the fortress of Pancorvo in advance of the river. Lord Wellington, to avoid a useless sacrifice of men in forcing the passage of the Ebro in front of the enemy, moved his left by the road to Santander, through a rugged country, and directed it to pass the Ebro near its source by Rocamunde and San Martino, and then to follow the left or northern bank of the river towards Osma. The French position on the Ebro was thus turned, and the French fell back upon Vitoria, after an engagement at Osma, in which they were defeated. The whole allied army, having passed the Ebro on the 15th of June, followed the enemy, and on the 20th was concentrated near Vitoria, where the French had taken a strong position in front of the town, covering the three roads from Madrid, Bilbao, and Logroño, which united at Vitoria.

The two hostile armies were nearly equal in number, amounting to from 70,000 to 75,000 men each. On the morning of the 21st Lord Wellington moved his army to attack the enemy in three divisions. The left, under General Graham, was directed by a circuitous movement to turn the enemy's right across the Bilbao road, and cut off his retreat to France by the Bayonne road; the right, under General Hill, was to commence the action by crossing the river Zadorra where the road from Madrid to Vitoria intersects the river, and to attack the enemy's left on the high ridge behind the village of Subijana de Alava: and the centre, consisting of the 3rd, 4th, 7th, and light divisions, in two columns, was to attack the French centre. General Hill succeeded, after a severe contest, in carrying the heights of Subijana de Alava, when King Joseph ordered his left to fall back for the defence of Vitoria. In the mean time General Cole, with the 4th and light divisions, crossed the Ebro by the bridges of Nanclaras and Tras Puentes, and soon afterwards the 3rd and 7th divisions crossed the river higher up, and marched against the centre of the French, who received the advancing columns with a destructive fire. General Picton's division, the 3rd, coming in contact with a strong body of the enemy, drove it back, and took its guns. The other divisions coming up, the French abandoned their position, and began their retreat in good order towards Vitoria. But while this was passing in front, General Graham, moving along the road from Bilbao, had attacked the French right, which was posted on the heights beyond the Zadorra, above the village of Abechuco, and had dislodged it from thence, and then, ascending the right bank of the Zadorra towards the road to Bayonne, he carried the village of Gamarra Mayor: at the same time the Spanish division of Longa carried the village of Gamarra Menor, which is on the right bank of the river opposite the road to Bayonne, which runs along the left bank, the heights of which were occupied by two divisions of French infantry in reserve. Towards the evening however the main body of the French army having been driven through the town of Vitoria, the divisions on their right withdrew hastily from their position; and then General Graham, crossing the Zadorra, took possession of the Bayonne road, by which the French were retreating, and this movement threw their army into irretrievable confusion. Their columns were obliged to alter their line of retreat, and take the road to Pamplona, abandoning all their baggage, artillery, ammunition, military chests, and the court equipage of King Joseph, and were followed after dark by the Allies. It was the most complete defeat that the French ever experienced in Spain. On this occasion the Spanish divisions under Generals Morillo and Longa, who were in the field with the British and Portuguese army, behaved remarkably well, and were honourably mentioned in Lord Wellington's dispatch after the battle. The total loss of the French was 740 killed and 5174 wounded. The loss of the French was stated by themselves at 6000. About 1000 prisoners fell into the hands of the Allies. But the French lost also 151 guns, 415 caissons, more than 100 waggons, an immense quantity of ammunition, and all the baggage of the army, and the whole baggage of Marshal Jourdan. They carried away only one gun to Pamplona. King Joseph's carriage was seized, and he had hardly time to escape on horseback. Many carriages belonging to his court, with ladies, were also taken.

The French, leaving a strong garrison at Pamplona, continued their retreat to France. General Foy, who was not present at the battle, being near Bilbao, likewise fell back upon Bayonne, and was pursued by General Graham. A French garrison remained at San Sebastian. General Clausel, who was coming up from Logroño with about 15,000 men, hearing of the defeat at the battle, turned back by back to Zaragoza, and thence, by Jaca and the central Pyrenees, into France, having lost his artillery. Suchet alone remained with his army in Catalufia and Valencia, having his hands fully employed in that quarter.

Lord Wellington, having established the blockade of Pamplona, and directed General Graham to invest San Sebastian, advanced with the main body of his army to the Pyrenees, to occupy the passes from Roncesvalles to Irun, at the mouth of the Bidasoa.

When the news of the battle of Vitoria reached England, there were great public rejoicings; and Lord Wellington was appointed a Field Marshal of England. "You have sent me," thus wrote to him the Prince Regent of England, "among the trophies of your unrivalled fame, the staff of a French Marshal, and I send you in return that of England." The Spanish Cortes, by a decree, created him Duke of Vitoria, and granted him in perpetuity the estate of Soto de Roma, in the kingdom of Granada.

When Napoleon, in his camp in Saxony, heard of the disaster of Vitoria, he said, "It was sorely vexed, and has immediately sent Marshal Soult to the Army of Spain, with the rank of 'Lieutenant of the Emperor.' Soult arrived on the Spanish frontier on the 13th of July, and set about restoring order and confidence in his army, which consisted of nine divisions of infantry (nearly 80,000 men), and three divisions of cavalry. He told them, in a proclamation dated 4th July, that the disasters of the preceding campaign were owing to pusillanimous councils and unskilful dispositions of their late commanders. "Let us not, however," added he, "demand the enemy of the praise which is due to him. The dispositions and arrangements of their general have been prompt, skilful, and consecutive, and the valour and steadiness of his troops have been praiseworthy." He concluded by saying that his instructions from the emperor were "to drive the enemy from those lofty heights which enable him proudly to survey our fertile valleys, and drive them across the Ebro. It is in the Spanish soil that your tents must next be pitched, and your resources drawn. . . . . Let the account of our success be dated from Vitoria, and the birth of his Imperial Majesty be celebrated in that city."

Marshal Soult's first object was to relieve Pamplona. With this view he collected the main body of his army at St. Jean Pied de Port, and on the 25th of July attacked, with between 30,000 and 40,000 men, the British right at Roncesvalles. General Cole moved to the support of that post, but the French having turned the British position, General Cole considered it necessary to withdraw in the night, and

Digitized by Google

march to Zubiri. In the meantime two French divisions attacked General Hill's position in the Puerto de Maya, at the head of the valley of Bastan. At first they gained ground, but were again driven back, when the retrograde movement of General Cole, on his right, induced General Hill to withdraw likewise to Irurita. Lord Wellington, who had his head-quarters at Lesaca, on the left of the army, heard of these movements late in the night, and concentrated his army to the right. On the 27th the French made a partial attack on the 4th division, near Sorarren, but were repulsed. On the 28th Soult directed a grand attack, first on the left, by the valley of the Lanz, and then on the centre of the British position. The 4th division (General Cole's) sustained nearly the whole brunt of the attack, and repulsed the enemy with the bayonet. In one instance the French succeeded in overpowering a Portuguese battalion on the right of General Ross's brigade, at the chapel of Sorarren, which obliged General Ross to withdraw, and the enemy established himself for a moment on the line of the Allies; but Lord Wellington directed the 27th and 48th regiments to charge, and the French were driven down the hill with great loss. On the 29th both armies remained inactive. Soult changed his plan, and on the 30th endeavoured to turn the British left by an attack on General Hill. He collected a large body on his right for this purpose, and by manœuvring on the left flank of Hill's corps, obliged him to withdraw from the height which he occupied behind Lizaso to another range about a mile in the rear, where, however, General Hill maintained himself against every effort that was made to dislodge him. At the same time Lord Wellington attacked the French corps in his front, in a strong position, between the valley of the Lanz and that of Arga, and obliged them to retire. On the morning of the 31st the French were in full retreat into France, by the various passes of the Pyrenees, followed by the Allies, who took many prisoners and much baggage. These various combats are designated by the name of the 'Battles of the Pyrenees.' On the 1st of August Lord Wellington took possession of the passes in the mountains.

During the month of August General Graham was pressing the siege of San Sebastian. On the 31st of August the assault was made, and the town was carried, but with great loss, and after a most determined resistance. The French garrison retired to the castle. Many excesses were committed by the British and Portuguese soldiers after they had entered the town. Most of the houses were plundered, and it was not till the 2nd of September that order was restored by severe measures. The castle of San Sebastian capitulated after a few days. The siege and capture of this place cost the Allies nearly 4000 men, killed and wounded. Three British general officers were wounded, and Sir Richard Fletcher, the commanding officer of engineers, was killed.

In the month of October Lord Wellington moved his left across the Bidasoa upon French ground, and took possession of the hills above La Rhune. The French made only a slight resistance, as Marshal Soult had already fixed upon the line of the river Nivelle in his rear for a position. On the 31st of October the French garrison of Pamplona, 4000 strong, having lost all hopes of relief, surrendered themselves prisoners of war. Early in November Lord Wellington made his preparations for marching his whole army into France, where they would find good cantonments for the winter. Before however taking this serious step he issued an order of the day to all his troops of the various nations that composed the Allies nearly 4000 men, killed and wounded. Three British general officers were wounded, and Sir Richard Fletcher, the commanding officer of engineers, was killed.

their entrenched camp in front of Bayonne. Lord Wellington's head-quarters were established at St. Jean de Luz on the right bank of the Nivelle. The Allies went into cantonments between the sea and the river Nive, where their extreme right rested on Cambo. The enemy guarded the right bank of the Nive from Bayonne to St. Jean Pied de Port.

Lord Wellington, being straitened for room and supplies for his large army, determined to cross the Nive and occupy the country between that and the Adour. On the 9th of December General Hill forded the Nive above Cambo, while the 6th division crossed at Ustarits, and the French were dislodged from their position at Ville Franque. In the night all their posts were withdrawn to Bayonne, and on the 10th the British right rested on the Adour. On that day Soult, resuming the offensive, issued out of Bayonne, and attacked the British left under Sir John Hope, which covered St. Jean de Luz, where the Allies had considerable depôts of stores. The French came on with great spirit and twice succeeded in driving in the fifth division of the Allies, and twice were repulsed again, the first time by the 9th British and 4 Portuguese battalion, and the second time by the brigade of Guards. At last night put an end to the fight. Next morning, December 11, Soult, having withdrawn in the night most of his force from the position in front of the British left, prepared to attack the right, pressing on with overwhelming numbers. General Hope, suspecting this, had moved part of his troops to their right to support the light division. This occasioned another change in Soult's movements, who again directed several columns against the left at Barouilhet. The troops were occupied in receiving their rations, and had barely time to run to their arms; but they withstood the attack, and at the close of the day both armies remained in their respective positions. Marshal Soult now giving up any further attempt on the left of the Allies, and imagining that his repeated attacks on that side must have induced Lord Wellington to weaken his right, changed his plan, and during the night of the 12th moved with his main force to his left to attack the British right. Lord Wellington however had foreseen this, and had given orders to the 4th and 6th divisions to support the right, and the 3rd division was held in readiness for the same object. General Hill had under his immediate command above 13,000 men, and his position extended across from the Adour beyond Vieux Mongueree to Ville Franque and the Nive. Soult directed from Bayonne on the 13th a force of 30,000 men against his position. His columns of the centre gained some ground, but were fiercely repulsed. An attack on Hill's right was likewise successful at first, but was ultimately defeated. Soult at last drew back his troops towards his entrenched camp near Bayonne. General Hill had withstood all the efforts of the enemy without having any occasion for the assistance of the divisions which Lord Wellington had moved towards him. Lord Wellington was well pleased, and said, "Hill, the day is all your own."

Nothing of importance occurred during the few remaining days of the year 1813. Both armies remained in winter-quarters. On the 1st of January in this year (1814) Lord Wellington had been gazetted as Colonel of the Royal Regiment of Horse Guards, in place of the Duke of Northumberland, who had resigned; and on the 4th of March he had been elected a Knight of the Garter.

Campaigns of 1814.—The mighty contest which had been carried on for ten years between France and the rest of Europe was drawing fast to a close. The battle of Leipzig (October 1813) had given the death-blow to the ambition of Napoleon. He had lost another fine army which he had got together with great pains after the disasters of the preceding campaign in the depths of the Russian year. The scanty host were driven out of Germany across the Rhine; that river which, according to his early declarations, constituted the natural frontier of France, but which he had not had self-command enough to respect. He was now reduced to the necessity of depending upon the resources of France alone. Lord Wellington had long foretold that, when that should come to be the case, the feelings of the French population would turn against him. Napoleon had hitherto supported his enormous armies chiefly at the expense of foreign states.

On his return to Paris, in November 1813, Napoleon decreed by a senatus consultum a new levy of 300,000 conscripts. In December he ordered the assembling of 150,000 national guards to garrison the towns and fortresses. He talked however of peace, but he hesitated, and lost time in agreeing to the preliminary basis of a treaty such as was offered to him by the Allied Powers at Châtillon. He left his own envoy there without instructions or powers. He wished in short to try once more the chances of war. On the 25th of January 1814 he left Paris for Châlons to attack the Prussians and Russians.

Lord Wellington now made his preparations to drive the army of Soult from the country on the left of the Adour. About the middle of February, by a succession of movements and partial engagements, he drove the French first across the Bidasoa, and afterwards across the Gave d'Oléron, an affluent of the Adour. On the 27th of February he met Soult's army concentrated at Orthez on the Gave de Pau, attacked and beat it, and pursued it to the Adour, the French retiring eastward towards Auch. On the 1st of March Lord Wellington's head-quarters were at St. Sever, north of the Adour. The loss of the Allies at the battle of Orthez was 277 killed, and about 2000 wounded or missing. The loss of the French army was considerable during

Digitized by Google

the battle, and still more during the retreat, owing to desertion having spread to a great extent, especially among the conscripts, who threw away their arms in vast numbers.

The battle of Orthez had important results. The garrison of Bayonne was now left to its fate, and the road to Bordeaux lay open to the allies. Lord Wellington gave orders to General Hope for the siege of Bayonne, and detached Marshal Beresford with two divisions to occupy Bordeaux. On the arrival of the allies at the latter city, the mayor and most of the inhabitants, of their own accord, proclaimed Louis XVIII.

Lord Wellington's business was purely military. In the Spanish peninsula it was to drive the invader out of the country, and leave the people to settle their own affairs. In France, from a similar principle, he was extremely anxious not to countenance a civil war. The Duke of Angoulême having landed in the south of France to excite a movement in favour of the Bourbons, Lord Wellington advised him politely to keep incognito, and to wait for some more important demonstration in his favour. When Beresford marched upon Bordeaux he directed him most particularly not to originate or encourage any rising of the Bourbon party. "If they should ask you for your consent to proclaim Louis XVIII., to hoist the white standard, &c., you will state that the British nation and their allies wish well to Louis XVIII.; and as long as the public peace is preserved where our troops are stationed, we shall not interfere to prevent that party from doing what may be deemed most for its interest; nay, further, that I am prepared to assist that party in any way in which I can do it, and us in getting the better of Bonaparte. That the object of the Allies however in the war, and above all in entering France, is, as is stated in my proclamation, Peace; and that it is well known that the Allies are now engaged in negociating a treaty of peace with Bonaparte. That however I might be inclined to aid and support any act of people against Bonaparte while at war, I could give them no further aid when peace should be concluded; and I beg the inhabitants will weigh this matter well before they raise a standard against the government of Bonaparte and involve themselves in hostilities. If however, notwithstanding this warning, the town should think proper to hoist the white standard, and should proclaim Louis XVIII., or adopt any other measure of that description, you will not oppose them; and you will arrange with the authorities the means of drawing, without loss of time, for all the arms, ammunition, &c., which are at Dax, which you will deliver to them. If the municipality should state that they will not proclaim Louis XVIII. without your orders, you will decline to give such orders, for the reasons above stated." ('Dispatches,' xi. p. 555 and 556.)

On the 18th of March Lord Wellington moved his army to Vic Bigorre, and Soult retired to Tarbes, which he abandoned on the 20th, and continued his retreat to Toulouse, where he arrived on the 24th. On the 27th the Allies arrived on the left of the Garonne, in front of Toulouse. The object of Soult was to facilitate a junction with Suchet, who was withdrawing his troops from Catalufia, in consequence of Ferdinand having been sent back to Spain, and acknowledged as King of Spain by Napoleon, who had resorted to this new political stratagem in order to create discord among the allies. Knowing the character of Ferdinand, he had written to him on the 12th of November 1813, saying, "That the circumstances of the times made him wish to conclude at once the affairs of Spain, where England was fomenting anarchy and revolution, and was impoverishing the nobility, in order to establish a republic. He (Napoleon) was much grieved to see the destruction of a nation bordering upon his empire, and whose maritime interests were closely connected with his own. He wished therefore to remove all pretence for the influence of England to interfere in the affairs of Spain, and to re-establish the relations of friendship and good neighbourhood between the two nations." (Thibaudeau, 'Histoire de l'Empire,' ch. 94.) A treaty was concluded at Valençay, where Ferdinand had been detained a prisoner for five years, in which Napoleon acknowledged him as King of Spain and of the Indies, and promised to withdraw the French troops from Spain, whilst Ferdinand engaged to cause the English to evacuate the Peninsula.

At last, in the month of March, Napoleon, being hard pressed for troops for the defence of France, and wishing to avail himself of the army of Suchet, which was uselessly cooped up in Catalufia, allowed Ferdinand to return to Spain. Meantime Suchet, who had already detached early in March 10,000 men to join Soult, made an offer to the Spanish Regency to withdraw the garrisons from Catalufia, which were blockaded by Spanish troops, on condition of their being allowed to return to France with their arms. The Regency referred the proposal to Lord Wellington for his opinion, and he recommended them not to allow any capitulation with any French troops, except on the condition of their being prisoners of war. Suchet's garrisons amounted to about 18,000 men, mostly veteran soldiers, who, if they had been able to join Soult on the Garonne, would have made him too strong for Wellington, part of whose army was stationed before Bayonne and at Bordeaux. Suchet, with his disposable force of about 14,000 men, evacuated Catalufia and re entered France. In the beginning of April he placed his head-quarters at Narbonne, but did not join Soult.

On the 10th of April, Lord Wellington, having crossed the Garonne

the day before, attacked Marshal Soult in his entrenched camp on a range of heights between the river Ers and the canal of Languedoc, on the eastern side of the city of Toulouse. Marshal Beresford, with the 4th and 6th divisions, attacked and carried the heights on the French right, and the redoubt which covered and protected that flank; the French however were still in possession of four redoubts and of the entrenchments and fortified houses, from which they could not be dislodged without artillery. At the same time the Spanish division of General Freyre had attacked the French left with great spirit, but were at first repulsed; one regiment however, the Tiradores de Cantabria, maintained its position under the enemy's entrenchments. Soon after, the light division moving up, the whole line again advanced to the attack. Marshal Beresford, having brought up his artillery, which had been detained by the badness of the roads, continued his movement along the ridge on the right of the French, and General Pack's brigade of the 6th division carried the two principal redoubts and fortified houses in the centre of the French position. Soult made a powerful attack on the 6th division, which received it with the bayonet, when the French general Taupin was killed. At last the French were driven entirely from the heights, and withdrew across the canal of Languedoc into the town of Toulouse, which Soult prepared to defend. The loss of the allies at the battle of Toulouse was about 600 killed and 4000 wounded. The French acknowledged the loss of 3200 men.

On the night of the 11th Marshal Soult evacuated Toulouse by the only passage open to him, and retired by Castelnaudary to Carcassonne. On the 12th Lord Wellington entered Toulouse, to the great joy of the inhabitants, who were relieved from the fearful apprehensions of a siege. The white flag was flying, everybody had Bourbon cockades, and the statue of Henri Quatre, with a gilded crown, a statue and the eagles and other emblems of the imperial government. The municipality of Toulouse presented an address to Lord Wellington, requesting him to receive the keys of their city, in the name of Louis XVIII. Lord Wellington told them what he had told the people of Bordeaux, that he believed that negotiations for a general peace still being carried on with the existing government of France, and that they must judge for themselves whether they meant to declare in favour of the Bourbons, in which case it would be his duty to treat them as allies as long as the war lasted; but if peace should be made with Napoleon, he could not give them any assistance or protection afterwards. ('Dispatches,' xi., p. 630). In the afternoon however of the same day the English Colonel Cooke and the French Colonel St. Simon arrived from Paris, with news of Napoleon's first abdication, and of the establishment of a provisional government in the name of Louis XVIII. From Lord Wellington's head-quarters the two officers proceeded to those of Marshal Soult, who did not think himself justified in submitting to the provisional government, having received no information from Napoleon concerning what had happened, but he proposed an armistice to Lord Wellington. The British commander wrote to him a very polite letter, excusing himself from accepting the armistice, unless the marshal acknowledged the Provisional Government of France. In the object of Lord Wellington was to prevent Marshals Soult and Suchet's armies becoming the nucleus of a civil war in France in favour of Napoleon's pretensions for his son. At the same time he made preparations to pursue Soult, if required. At last on the 18th of April, Soult, having received from Berthier an order to stop all hostilities, concluded a convention with Lord Wellington for the purpose. A line of demarcation was drawn between the two armies. The head-quarters of Lord Wellington remained at Toulouse. Marshal Suchet concluded a like convention with Lord Wellington on the 19th, by which the final evacuation of Catalufia by the French garrisons was provided for.

Before the news of the events of Paris reached Bayonne, the French made a sortie out of the entrenched camp in front of it, on the 14th of April, and attacked the lines of the Allies, who lost about 800 men in this affair, including General Hay, who was killed. The general in command, Sir John Hope, who was wounded and taken prisoner, General Stopford, of the Guards, was also wounded.

On the 30th of April Lord Wellington set off for Paris, whither he was sent for by Lord Castlereagh. He left General Hill in charge of the army. On the 13th of May he returned to Toulouse, and soon afterwards set off for Madrid, where the army had already taken different sides; O'Donnell and Elio for the king, and Freyre and the Prince of Anglona for the constitution. Having in some degree quieted the contending parties, and got the affairs of the kingdom into a condition for being amicably settled, Lord Wellington returned to France, and on the 11th of June was again with his army at Bordeaux, giving orders for the evacuation of France by the allied troops. On the 14th of June he issued his farewell general orders to the army. ('Dispatches,' xii., p. 62.)

In May 1814 he had been created Marquis of Douro and Duke of Wellington, and the Prince Regent had sent to the House of Commons a message recommending them to grant the Duke such an annuity as would support the high dignity of the title which had been conferred upon him. On the 12th of May an annuity of 10,000*l* was granted to him, to be at any time commuted for the sum of 300,000*l*, which was ultimately increased to 400,000*l*. On the 23rd of June the Duke of Wellington arrived in London, and on the 28th received in his

Digitized by Google

place in the House of Peers the thanks of that House, and on the 1st of July he received likewise the thanks of the House of Commons, through the Speaker.

Peace of 1814.—After the establishment of peace by the treaty of Paris. May 30, 1814, the Duke of Wellington was sent in July as ambassador to the court of France. The Congress of Vienna assembled Nov. 1, 1814, and Lord Castlereagh having returned to England at the beginning of 1815, in order to resume his place in parliament, the Duke of Wellington was appointed to succeed him as the representative of Great Britain. In the month of January 1815 the Duke of Wellington repaired to Vienna to attend the general Congress of the European Powers. In the beginning of March, Napoleon, having escaped from Elba, landed at Cannes, on the French coast, and thence marched to Paris, without meeting any obstacle, Louis XVIII. having withdrawn to Ghent. On the 13th of March the ministers of the eight Powers assembled at Vienna, including the ministers of the King of France, signed a paper, by which they declared Bonaparte an outlaw, a violator of treaties, and a disturber of the peace of the world, and delivering him over to public justice. ('Dispatches,' xii., 269, 352.) At the same time they declared that they would maintain inviolate the treaty of Paris. On the 12th of April the Duke of Wellington was appointed to the command of the army to be assembled in the Netherlands.

Campaign of Waterloo, 1815.—In the middle of April the Duke of Wellington repaired to Brussels to prepare for the impending military contest. An English army was assembled in Flanders, including the Hanoverian Legion, and was joined by the troops of the King of the Netherlands, of the Duke of Brunswick, and of the Prince of Nassau. In all he had about 76,000 men under him, of whom 49,000 were British, or Hanoverians in British pay. Of these, deducting sick, detached, &c., there remained present in the field about 37,000 British and Hanoverians. The head-quarters were fixed at Brussels. Marshal Blücher, with the Prussian army, estimated at about 80,000 men, was on the left of the British; his head-quarters were at Namur.

During the month of May, Napoleon by great exertions collected an army of about 120,000 men, chiefly composed of veterans, on the frontiers of Flanders; and on the 11th of June he left Paris to take the command. On the 15th the French crossed the Sambre, and marched to Charleroi, the Prussian corps of General Ziethen retiring to Fleurus. Marshal Blücher concentrated his army upon Sombref, holding the villages of St. Amand and Ligny in front of his position. The Duke of Wellington marched his army upon Quatre Bras, on the road from Charleroi to Brussels. Napoleon attacked Blücher on the 16th, with superior numbers, carried the village of Ligny, and penetrated to the centre of the Prussian position; but the Prussians fought with great gallantry until night, when Blücher withdrew his army in good order to Wavre. In the mean time the Duke of Wellington, with part of his army, was attacked at Quatre Bras by the 1st and 2nd corps of the French army, commanded by Ney, and a corps of cavalry under Kellermann, which however made no impression upon the British position.

On the 17th the Duke of Wellington made a retrograde movement upon Waterloo, corresponding to that of Marshal Blücher. He took up a position in front of the village of Waterloo, across the high roads from Charleroi and Nivelles—his right thrown back to a ravine near Merke Braine, and his left extended to a height above the hamlet of Ter la Haye; and he occupied the house and gardens of Hougomont, near the Nivelles road, in front of his right centre, and the farm of La Haye Sainte in front of his left centre. The French collected their army, with the exception of the 3rd corps, which had been sent to observe the Prussians, on a range of heights in front of the British position.

About ten o'clock on the morning on the 18th of June the French began a furious attack on the post of Hougoumont, which was occupied by a detachment of the Guards, who maintained their ground against all the efforts of the enemy throughout the day. There was no manœuvring on the part of Napoleon on that day. He made repeated attacks on the British position with heavy columns of infantry, supported by a numerous cavalry, and by a deadly fire from his numerous artillery. His attacks were repulsed with great loss on both sides. In one of these attacks the French carried the post of La Haye Sainte, which was occupied by a detachment of Hanoverians, who, having expended all their ammunition, were cut to pieces. Napoleon then ordered his cavalry to attack the British infantry, which formed in squares to receive them, but all the efforts of the French cavalry could make no impression on the British infantry, by whose steady fire they were brought down in great numbers. The French cavalry was nearly destroyed in these attacks, as well as by a charge from Lord E. Somerset's brigade of heavy cavalry, consisting of the Life Guards, the Royal Horse Guards, and the 1st Dragoon Guards, in which the French cuirassiers were completely cut up. At last, about 7 o'clock in the evening, when General Bulow's Prussian corps began to be engaged upon the French right, Napoleon moved forwards his guard, which he had kept in reserve, to make a last desperate effort on the British left centre near La Haye Sainte, of which the French had already possession. The French guard marched resolutely on in column, with supported arms, under a destructive fire from the British position. They halted at the distance of about fifty yards from the British line, and attempted to deploy, but they became mixed together, whilst uninterrupted discharges of musketry from the British infantry made fearful havoc in their dense mass. They were broken, and gave way down the slope of the hill in irretrievable confusion. On this the Duke of Wellington moved forward his whole line, which he led in person, sweeping away all before him. The French were forced from their position on the heights, and fled in confused masses, leaving all their artillery and baggage on the field of battle. Marshal Blücher now came up with two Prussian corps, and took charge of the pursuit, whilst the British troops rested on the field which they had won at such a fearful cost. The British and German Legion had on that day 2432 killed, 9528 wounded, and 1875 missing; many of the last however joined afterwards. In the preceding battle of Quatre Bras, on the 16th, they had 350 killed, and 2380 wounded, making altogether nearly 14,000 killed and wounded, in an army of about 37,000 British and Hanoverians, of whom however about 5000 were not present on the field of Waterloo, being posted near Brains le Comte, or stationed at Brussels, Antwerp, Ostend, and other places. (Official Returns, 'Dispatches,' xii. 485-87.) More than 600 officers were either killed or wounded at the battle of Waterloo. The gallant General Picton was killed while leading his division to a charge with bayonets. General Sir William Ponsonby, who commanded a brigade of heavy cavalry, was killed by a party of Polish lancers. Colonel De Lancey, quartermaster-general, was also killed. The Earl of Uxbridge, General Cooke, General Halkett, General Barnes, General Baron Alten, the Prince of Orange, and Lieutenant-Colonel Lord Fitzroy Somerset, were among the wounded. Lieutenant-Colonel the Hon. Sir Alexander Gordon died of his wounds soon after the battle. In the battle of Quatre Bras the Duke of Brunswick Oels was killed, fighting at the head of his corps. Such was the termination of the great continental war, which had lasted for twelve years from the rupture of the peace of Amiens in 1803.

After the last charge by his guard Napoleon rode off in the dusk of the evening, from the field of Waterloo, and returned to Paris, which he was soon afterwards obliged to leave for Rochefort, being deserted by the nation at large. A provisional government was formed by the legislative chambers. The British and Prussian armies marched upon Paris, meeting with little or no resistance; and on the 3rd of July a capitulation was agreed upon between Marshal Davout, who commanded the French army at Paris, on one side, and the Duke of Wellington and Marshal Blücher on the other, by which the French army withdrew from the capital, and retired beyond the Loire, and the allied armies occupied Paris. On the second day after this Louis XVIII. again restored to the throne of France, and peace was concluded between France and the Allied Powers.

After the return of the Duke of Wellington to England, the House of Commons voted a sum of 200,000*l.*, in addition to the sums previously granted to him; and with this and his estate and mansion of Strathfieldsaye in Hampshire were purchased, to be held by the Duke of Wellington and his heirs on the condition of presenting a tri-coloured flag to the sovereign at Windsor Castle on the 18th of June every year. The King of the Netherlands conferred on him the title of Prince of Waterloo, and the King of France created him a Marshal of France and Duke of Brunoy.

Peace of 1815.—The battle of Waterloo was succeeded by a peace in Europe which was not materially interrupted until the occurrence of the Greek and Turkish contest with Russia in 1854-5. To prevent any recurrence of those desolating wars which had just terminated, it was resolved by the Allied Powers that Napoleon should be detained in custody in the island of St. Helena, and that France should be controlled by an armed occupation. The Duke of Wellington was by unanimous choice appointed to the command in chief of the allied forces retained in France for this latter purpose; and it was chiefly owing to his mediation and influence with the allied sovereigns that no penalty of confiscation was enforced upon France, and that the armed occupation of the country was so soon terminated. In September 1818, the King of Prussia and the Emperors of Austria and Russia met at Aix-la-Chapelle, in order to hold a political conference, which was attended by the Duke of Wellington and Lord Castlereagh on the part of the British Crown. At this conference an agreement was concluded for the evacuation of France by the allied armies, and for the restoration of that kingdom to its independent dignity among the European governments. The allied armies began to evacuate France on the 1st of November 1818. A week previously the Emperors of Austria and Russia and the King of Prussia created the Duke of Wellington a Field-Marshal of their respective armies. He returned to England early in November.

When the allied armies were withdrawn from France the military life of the Duke of Wellington may be said to have terminated. He shortly afterwards commenced that life of political and administrative activity in which he attained an influence at home and a reputation abroad greater perhaps than that of any other public character of modern times. On the 1st of January, 1819, he was appointed to the office of Master-General of the Ordnance, and took his seat in the Cabinet as a member of the administration of Lord Liverpool. Though he did not at first take a prominent part in political affairs, he had to bear his share of the unpopularity which was the necessary result of the attempt of Lord Liverpool's government to put down disaffection.

When Mr. Canning, on the death of Lord Londonderry in August 1822, succeeded to the office of Foreign Minister, he selected the Duke of Wellington to proceed to the Congress at Verona as the representative of Great Britain. On the 10th of March 1826, the Duke was appointed High Constable of the Tower of London, and in the same year was sent on a special mission to St. Petersburg, the object of which was to induce the Emperor Nicolas to join Great Britain and the other European Powers as mediators in the quarrel between Turkey and Greece. The mission was successful. On the death of the Duke of York, January 22, 1827, the Duke of Wellington succeeded to the office of Commander-in-Chief of the Forces. On the 17th of February following a stroke of apoplexy terminated the political life of the Earl of Liverpool, and early in April Mr. Canning succeeded him as First Lord of the Treasury. The Earl of Liverpool died on the 4th of December 1828.

On the accession of Mr. Canning to office as premier, April 10, 1827, the Duke of Wellington, who had no friendly feeling to him as a man, nor any liking for the popular principles of policy which he professed, sent in his resignation not only of his seat in the Cabinet, which was attached to his office of Master General of the Ordnance, but also of his office of Commander-in-Chief of the Forces. The majority of the other members of the cabinet likewise resigned their offices. Mr. Canning died August 8, 1827, and was succeeded by Lord Goderich as premier. The Duke of Wellington then resumed his office of Commander-in-Chief of the Forces, but did not join the new ministry, which was of very short duration. Lord Goderich resigned, after holding the premiership till the end of the year.

On the 5th of January 1828, the king sent for the Duke of Wellington and offered him the premiership, which he accepted, though, only eight months previously, he had said in the House of Lords that he was "sensible of being unqualified for such a situation," and that he "should have been mad to think of it," words of which he was reminded at the time, as well as occasionally afterwards. He recalled Mr. Peel and Mr. Goulburn to the Cabinet, and retained five of those who had been favourable to the policy of Mr. Canning, namely Mr. Huskisson, Lord Dudley, Mr. Grant, Mr. Lamb, and Lord Palmerston. The Duke of Wellington now resigned the office of Commander-in-Chief of the Forces, and appointed Lord Hill as his successor. The parliamentary session of 1828 commenced January 29. On the 26th of February Lord John Russell brought forward in the Commons a motion for the repeal of the Test and Corporation Acts. The government opposed the measure, but the motion was carried in a full House of Commons by a majority of 44. Though the Duke did not approve of the policy of this measure, some of his colleagues did; and therefore, to avoid a division in the cabinet and opposition to a declared resolution of the Commons, he yielded, took up the bill, and passed it through the House of Lords, in spite of the desperate resistance of Lord Eldon and the other Tories of his school. The Duke also gave his sanction to a corn-bill introduced by Mr. Huskisson. Later in the session however, when a motion was made to disfranchise the corrupt borough of East Retford, and invest Birmingham with the electoral rights which might thus be vested in the county, against the same motion, but Mr. Huskisson voted for it. Mr. Huskisson was then Colonial Secretary, and feeling that he had placed himself in an awkward position, he wrote to the Duke to explain, and made some allusion as to his willingness to resign. The Duke, who had no liking for Mr. Huskisson's free-trade principles, immediately wrote to say that he had considered it his duty to lay the letter before the king, that is, to advise the king to accept the resignation. Mr. Huskisson, who had not intended to resign, wrote in explanation, but after several letters had passed between them the Duke continued indexible. It was related at the time, that when Lord Palmerston and Lord Dudley, as friends of Mr. Huskisson, waited on the Duke, and one of them observed that it was quite a mistake, the Duke replied emphatically, "it was no mistake, could be no mistake, and shall be no mistake." Mr. Huskisson therefore retired, and at the same time Lord Dudley, Lord Palmerston, and Mr. Grant, sent in their resignations, which were accepted. The Duke then called into office the Earl of Aberdeen, Sir Henry Hardinge, Sir George Murray, and Mr. Vesey Fitzgerald. Within a fortnight after the reconstruction of the cabinet, the question of Roman Catholic Emancipation was brought before both Houses. The motion for a committee to inquire into the claims of the Roman Catholics, which had been carried in the Commons, was lost in the Lords, but the Duke's speech on the question was decidedly conciliatory, though in opposition to motion. On the 20th of January 1829, the king conferred on the Duke of Wellington the offices of Governor of Dover Castle and Lord Warden of the Cinque Ports, after which the Duke occasionally resided at Walmer Castle, the official residence of the Lord Warden, which is situated on the coast of Kent, near Dover.

Mr. O'Connell aided by the Catholic Association had produced, by the process of agitation, a degree of discontent in Ireland which threatened an insurrection of the most dangerous character. Under these circumstances, though the Duke of Wellington and Mr. Peel were both opposed to the granting of the claims of the Roman Catholics, they decided at once that it was better to renounce the principle of political and civil disabilities founded on differences of religious belief than to expose the country to the risk of a civil war in Ireland. There was a difficulty however with George IV. After repeated interviews and arguments he refused his sanction to the proposed measure, till the Duke and Mr. Peel tendered their resignations. He then yielded; and on the 5th of February 1829, when parliament assembled, the king's speech contained a recommendation to review the laws which impose civil disabilities on Roman Catholics, and to consider whether their removal could be effected without danger to the establishment in church and state. In the debates on the speech the Duke in the House of Lords and Mr. Peel in the House of Commons announced the forthcoming measure. On the 10th of March the Roman Catholic Relief Bill was read a first time in the House of Commons, and the division on the third reading, March 30, was, 320 for it, and 142 against it; in the House of Lords, the division on the third reading, April 10, was, 213 for it, and 104 against it. The Bill was then passed, and soon afterwards received the royal assent. The opposition of Lord Eldon, Lord Winchelsea, and other Tories, was violent; but the Duke had brought the whole power of government into action, and triumphantly carried the measure. Lord Winchelsea, writing to a gentleman connected with the new institution of King's College, among other observations on the Duke's motives, imputed to him an intention "to introduce Popery into every department of the state." The Duke demanded an apology for the expressions used, which not being given, a duel ensued between them on the 21st of March. Lord Winchelsea, after the Duke had fired and missed, discharged his pistol into the air, and then tendered the required apology, which settled the dispute.

The parliamentary session of 1830 commenced on the 4th of February. On the 23rd of February Lord John Russell moved for leave to bring in a bill to enable Manchester, Leeds, and Birmingham, to return members to parliament, which was negatived by 188 to 140. On the 28th of May a motion made by Mr. O'Connell for leave to bring in a bill for the radical reform of abuses in the state of the representation of the people in the House of Commons was negatived by 319 to 13; and a motion by Lord John Russell, "that it is expedient to extend the basis of the representation of the people," was also negatived by 213 to 117. There was much distress throughout the country among the agricultural and manufacturing classes, and therefore much discontent; but the great body of the people, at that time, appeared to be indifferent to the question of a reform of the House of Commons. A change, however, and that sudden and violent, was about to take place.

George IV. died on the 26th of June 1830, and was succeeded by William IV., whose political opinions were believed to be more liberal than those of the deceased king, and whose disposition was known to be more affable and conciliatory. The British parliament was dissolved by proclamation, July 24, and a new one summoned. Almost immediately afterwards a French revolution took place at Paris. Charles X. was driven from his throne, and abdicated it. Louis-Philippe was chosen as his successor, with the title of King of the French. The excitement of that revolution extended over the British islands as well as over the continent of Europe. In Great Britain and Ireland the people were preparing for the election of new members of parliament, were everywhere seized with an ardent desire for more liberal institutions, and, as a preliminary step, for changes and reforms of the constituencies which elected the members of the House of Commons.

The new parliament assembled on the 26th of October 1830, and the king's speech was delivered by [illegible] IV. on the 2nd of November. During the debate which followed, Earl Grey, in the House of Lords, urged the necessity of an immediate reform of the House of Commons, and the Duke of Wellington, in reply, affirmed that "the country already possessed a legislature which answered all the good purposes of legislation, and that the system of representation possessed the full and entire confidence of the country," and declared that he was "not only not prepared to bring forward any measure of reform," but would "resist any such measure as long as he held any station in the government of the country." Public meetings were immediately called throughout the country, which were attended by vast numbers The Duke had already given offence by his measures against the press, and his declaration against reform now roused the people to a state of excitement little short of fury. On the 15th of November the government were in a minority in the House of Commons, and on the 16th the Wellington ministry ceased to exist, and was succeeded by that of Earl Grey. On the 22nd of April 1831 the king dissolved the parliament, in order to ascertain the sense of the people respecting his proposed alteration in the representation of the House of Commons. The new parliament met on the 14th of June, and the Reform Acts for England, Scotland, and Ireland were passed June 7, July 17, and August 7, 1832. The Duke of Wellington opposed the Reform Bills steadily, and spoke frequently in opposition. Hence he became excessively unpopular, and the bitterness of the feeling—at least of the lower orders—may be inferred from the fact, that when he returned from a visit to the Tower, June 18, 1832, he was hooted and roughly treated by the mob, and would scarcely have reached his residence (Apsley House) in safety, if some gentlemen and soldiers had not placed themselves around his horse, and escorted him. The windows of Apsley House were also broken, and he afterwards protected them by iron casings.

The office of Chancellor of the University of Oxford became vacant

Digitized by Google

by the death of Lord Grenville, January 12, 1834, and on the 20th of the same month the Duke of Wellington was unanimously elected to succeed him. The ceremony of installation took place on the 9th of June following, and was attended by a vast concourse of persons.

On the 8th of December 1834 Sir Robert Peel was gazetted as First Lord of the Treasury, and the Duke of Wellington as Secretary of State for Foreign Affairs. This first Peel ministry terminated on the 8th of April 1835. Lord Melbourne, who had succeeded Earl Grey as premier, again resumed that office. William IV. having died on the 20th of June 1837, was succeeded by Queen Victoria, and Lord Melbourne retained the office of premier till August 30, 1841, when he resigned, and Sir Robert Peel again became prime minister. The Duke of Wellington accepted a seat in the Cabinet, but without taking office. After the death of Lord Hill, December 10, 1842, the Duke of Wellington succeeded him as Commander-in-Chief of the Forces, and continued uninterruptedly to perform the duties of that office till the termination of his life. The Duke's last political difficulty occurred in 1846, when the repeal of the Corn-Laws had become a necessity. Sir Robert Peel saw the necessity: he knew that there would be a large majority in the Commons, but success in the Lords depended on the influence of the Duke, who refused to support the measure, and Sir Robert Peel resigned office. The Queen then sent for Lord John Russell, but he was unable to form a ministry, and Sir Robert Peel was recalled. The Duke then saw the necessity of the repeal. He put aside his own opinion, stood his friend Sir Robert, told the Lords distinctly that they must yield to the Queen and the Commons, and by his influence and his proxies passed the measure through the House of Lords, May 23, 1846, by a majority of 47.

The Duke of Wellington died Sept. 14, 1852, at Walmer Castle, aged 83, seeming as if he had fallen asleep in his chair, after a slight illness in the morning. He was buried in St. Paul's Cathedral, London, under the dome, and beside the remains of Lord Nelson. The funeral was public, and similar to that of Nelson, which took place Jan. 9, 1806; and during the procession to the cathedral, Nov. 9, the deep sympathy of all classes of the people for the loss of the greatest of Britain's military commanders was as strongly manifested as it had been at the funeral of her greatest naval hero. He was succeeded in his title and estates as Duke of Wellington by his eldest son Arthur, Marquis of Douro, who was born in 1807. The Duchess of Wellington died in 1831.

The leading characteristic of the Duke of Wellington's mind seems to have been sound good sense, based on patient examination into details, and a careful study of the whole in order to arrive at a right conclusion. He made allowance for contingencies, passions, interests, estimated things at their real value, and was rarely wrong. His great principle of action seems to have been a sense of duty rather than the stimulus of glory or ambition. His manner was in general singularly calm. He never seemed to be elated by success, nor depressed by discouragements or difficulties. Quickness of decision and energy of execution marked his character during the whole of his life. He was not inflexible however in carrying out his plans as a commander or his views as a statesman; but altered his course when new information or a change of circumstances offered a sufficient reason for a change of determination. He was regular in his attendance in the House of Lords, and spoke frequently. His influence over the members of that House was such as probably has never been possessed by any other individual. As a public speaker, his delivery, without being florid or rapid, was emphatic and vehement. In private life he was simple and methodical. He was temperate in the use of food and wine, slept on a hair-mattress on a simple camp-bedstead, was an early riser, and was indefatigable in his attention to business. He seldom made use of a carriage, and continued to ride on horseback when from the infirmities of age he could no longer sit erect, and he also used the exercise of walking even to the last, though his steps were slow and faltering.

WELLS, CHARLES WILLIAM, physician, was born at Charlestown in South Carolina, U.S., in May, 1757. His father and mother were natives of Scotland, and emigrated in 1755. He was sent by his father to Dumfries and afterwards to Edinburgh, for the purpose of being educated, and returned to Carolina in 1771. The revolutionary movements shortly after commenced in America, and his father, who espoused the royalist party, was obliged to flee to Great Britain, where he was followed by his son in 1775. He then went to Edinburgh, and commenced the study of medicine, and here formed an intimacy with David Hume, and William Miller, afterwards lord Glenlee. After acting as surgeon in a Scotch regiment in Holland, he graduated at Edinburgh, in 1780. He returned to America the same year, and with the remains of his father's and brother's property went to St. Augustine, in East Florida, where he conducted a newspaper in his brother's name. On the preliminaries of peace being signed in 1783, he again went to Charlestown, where he was seized and thrown into prison, and continued there for three months, having escaped further confinement by paying a ransom. On returning to St. Augustine he was shipwrecked, and only saved his life by swimming on shore. He returned to London and commenced practice as a physician in 1785. In 1790 he was appointed physician to the Finsbury Dispensary, and in 1795 was elected assistant-physician to St. Thomas's Hospital, and full physician in 1800.

Dr. Wells was a fellow of the Royal Society, and published the following papers in their 'Transactions':—1, In 1795, 'On the Influence which incites the Muscles of Animals to contract, in M. Galvani's Experiments.' 2, In 1797. 'Experiments on the Colour of the Blood.' 3, In 1811, 'Experiments and Observations on Vision.' In the 2nd and 3rd volumes of the 'Transactions of a Society for the Promotion of Medical and Surgical Knowledge,' he published several papers on various departments of medicine. His contributions to newspapers and magazines were very numerous, embracing politics, general literature, and biography. His last work, and the one on which his reputation as a philosopher must rest, is his 'Essay upon Dew,' which was published in 1814. The demonstration of the nature of dew in this work is an extremely fine application of the principles of induction in philosophical inquiry, and has deservedly given the author a wide-spread reputation. The experiments involved in this inquiry were such as to lead him to expose himself frequently for long intervals together to the night-air. The consequence was, that it brought on attacks of disease from which he never ultimately recovered, and he died on the 18th of September 1817. Dr. Wells was an accurate observer and acute reasoner, rather than an original thinker. On the extent to which he was indebted to previous investigators for his views on the Theory of Dew, see a paper by Mr. Charles Tomlinson, F.R.S., in the 'Edinb. New Phil. Transactions' for Jan. 1861.

WELSTED, LEONARD, a small poet, or versifier, of the last century, was sprung from a reputable Leicestershire family, and was the grandson, through his mother, of the lawyer and antiquary Thomas Stavely, known for his curious volume against popery, entitled 'The Romish Horseleech.' Welsted was born at Abington in Northamptonshire, in 1689, and was educated at Westminster School. The common statement that he afterwards studied at both universities without taking a degree, and wrote a satirical pamphlet, called 'The Characters of the Times,' published, in 8vo, in 1728, which has been sometimes ridiculously attributed to Welsted himself, who is one of the persons satirised in it. Early in life, by the interest of the Earl of Clare (afterwards Duke of Newcastle), he obtained a situation in the Ordnance-Office, which he held till his death, in 1747. Welsted's earliest production is supposed to have been a short poem of some humour, called 'The Apple-Pie, a Tale,' which may be read in Nichols's 'Select Collection of Poems,' with notes, iii. 78. But this was originally attributed to Dr. William Hall. One of those is a notice in Johnson's 'Lives of the Poets'); nor was it claimed for Welsted till 1735, when he was asserted to be the author in a periodical publication called 'The Weekly Chronicle' (for 16th August), with the remark, that King had "let it pass some years in silence, out of discretion as his friend." King died in 1712. Others of Welsted's poems appeared in 1709, 1710, &c. One of his literary performances is a translation of Longinus from the French; another is a comedy, entitled 'The Dissembled Wanton; or, My Son, get Money,' which was brought out with considerable success at Lincoln's Inn Fields in 1726, and printed the same year. But what has chiefly been the means of preserving Welsted's name is a piece called 'The Triumvirate, or a letter in verse from Palemon to Celia at Bath,' which he published in 1718. For this, which, according to one of the notes on the 'Dunciad,' "was meant for a satire on Mr. Pope and some of his friends," the luckless author was immortalised ten years after in the third book of that poem, in the following parody on Denham's well-known lines:—

> "Flow, Welsted, flow! like thine inspirer, beer;
> Though stale, not ripe; though thin, yet never clear;
> So sweetly mawkish, and so smoothly dull;
> Heady, not strong; o'erflowing, though not full."

But there is a note of Pope's on the prologue to the Satires, which implies that there was also a personal cause for Pope's animosity against him. He is also noticed in the second book, and in the treatise 'Of the Art of Sinking in Poetry,' published the year before the 'Dunciad.' A note on the passage quoted above affirms that Welsted was one of Sir Robert Walpole's anonymous writers, and that it appeared from the Report of the Secret Committee of 1742 that he had at one time received 500*l.* for his secret services in that capacity. Welsted was twice married: first, to a daughter of Henry Purcell, the eminent musical composer; secondly, to a sister of Bishop Walker, the defender of Londonderry, who survived him.

WENCESLA'US, or WENZEL, Emperor, or more correctly King, of Germany, the eldest son of the Emperor Charles IV., of the house of Luxemburg, was born in 1361. Charles intended to intrust the government of Germany to Wenceslaus by a formal Diploma, but the poet declined the honour, and the young prince was instructed by other teachers. The system of education, which was planned by the emperor himself, was bad; and the consequences were that Wenceslaus became unfit for the high post for which he was destined by his birth. At the age of two, he was crowned king of Bohemia; at twelve, he was invested with the margravate of Brandenburg; and at sixteen, he was chosen and crowned king of the Romans. From the accession of Rudolph I., in 1273, no Roman king had been chosen, the electors thinking that the election of a successor to the reigning emperor was incompatible with the freedom of election. They objected to the youth of Wenceslaus, but Charles answered them that the sons of kings had received from God souls much more enlightened than those of other men, and as their education was likewise more carefully con-

Digitized by Google

ducted, they of course, at the age of sixteen, knew quite as much as, and were in every other respect superior to, common men of double that age. The electors were less persuaded by these arguments than by the wealth of Charles, who is said to have given one hundred thousand gold guldens to each of them, besides estates and other advantages, and thus Wenceslaus was chosen king at Frankfurt in 1376.

Wenceslaus succeeded his father in 1378. The state of the empire was this:—After the death of Pope Gregory XI., at Avignon, in 1378, the Roman cardinals chose Urban VI., who was to reside in Rome. The French cardinals however chose Clement VII., who maintained himself a short time in Rome, but he was driven out by Urban VI., and took up his residence at Avigoon. Wenceslaus recognised Urban VI. as pope, and in return received the papal recognition of his election to the imperial throne, which he had not yet obtained. His policy involved him in difficulties with the kings of France, Charles V., and, after him, Charles VI., from which however he disentangled himself by an alliance with King Richard II. of England, in 1381, who married the emperor's sister, Anne, and who likewise recognised Urban VI. As to the disturbances occasioned by the disputed government of two popes, the emperor was unable to quell them; and he only quieted Clement VII.'s adherents among the princes of the empire by granting to them several important privileges. To Leopold, duke of Austria, he pledged the imperial rights over the free cities of Suabia for a large sum of money. These cities, fearing that they would lose their freedom under Leopold, concluded an alliance to which a great number of towns and free cities on the Rhine adhered, and they defended themselves against the duke. Some other princes of Southern Germany also tried to obtain imperial rights, and thus gradually the sovereignty over other towns and free cities, and for that purpose they concluded a union, which was headed by Eberhard, count of Würtemberg, and Leopold, duke of Austria, who had very extensive possessions in Suabia. The consequence was a dreadful civil war between the princes and the citizens, whose party was strengthened by the towns and cities of Switzerland, which was then a province of Germany. In Switzerland the princes were defeated in the battle of Sempach (9th of July 1386), where Duke Leopold of Austria was slain, with 656 counts and knights; but 1,500 of the citizens were routed at the battle of Döfingen (24th of August 1388) and in several other engagements. Wenceslaus tried to pacify the belligerent parties, but his measures were partial, and had no effect. In order to please the victorious princes, he cancelled the heavy debts which they had contracted by borrowing money from the Jews, a proceeding of which we find many other instances in Germany, England, and France: 3000 Jews were killed by the mob in Prague. For some time the emperor, who seldom left Prague, succeeded in maintaining peace in Bohemia and other parts of his extensive empire, but he abandoned himself to a dissolute life and committed many acts of cruelty. By his order John Pomuk, commonly called Nepomuk, a virtuous divine, and afterwards a saint, was drowned in the Moldau, after Wenceslaus had tortured him with his own hand. His brother Sigismund likewise fell under the displeasure of the emperor, and he shared himself faithless to his own brothers, and to Jobst of Moravia, who surprised the emperor and put him in prison, in order to obtain justice from him, but was compelled to liberate him at the summons of the other princes. As Wenceslaus resided at Prague, and seldom appeared in any other part of the empire, the princes declared that they would depose him if he did not fulfil his duty of visiting the provinces of the empire, and contributing by his personal appearance to their tranquillity. Through sloth or timidity, Wenceslaus did not leave Bohemia, but appointed his brother Sigismund vice-general of the Roman empire, and kept for himself nothing but the imperial name.

The state of the Church was still deplorable: Boniface IX., the successor of Urban VI., was pope at Rome, and Benedict XIII., the successor of Clement VII., was pope at Avignon. The doctrines of Wycliffe had found their way into Bohemia, where they were propagated by Huss, and the confusion was so great, that a general council was considered the only means of restoring peace to the church. On this Wenceslaus suddenly left Bohemia and appeared at the diet at Frankfurt (1399), but his propositions were so imprudent, and his conduct so destitute of good faith, that the princes resolved to depose him. He was summoned to appear at Lahnstein before the tribunal of the electors, and on his non-appearance he was declared to have forfeited his crown, and his deposition, founded on seven different charges, was pronounced by John, archbishop of Mainz, in the presence of a numerous crowd (20th August 1400). Ruprecht, elector-palatine, was chosen emperor on the following day. Wenceslaus protested against his deposition, and continued to style himself emperor, and as such he was recognised by the council of Pisa in 1409. But he had not influence enough to form a powerful party in the empire, and even his authority in Bohemia was disregarded by his brother Siegmund, who kept him in prison for two years. After the death of Ruprecht, in 1410, Wenceslaus, without giving up his imperial title, effected the election of his cousin Jobst of Moravia, who died in the following year (1411). The choice of the electors fell upon Siegmund, elector of Brandenburg and king of Hungary, the brother of Wenceslaus, who now renounced the imperial title and lived quietly in Bohemia. He tried to protect Huss against the proceedings of the Council of Constanz, but did not succeed. After the burning of Huss, in 1415, his adherents in Bohemia formed a union, the ultimate consequence of which was the dreadful war of the Hussites against the empire. The beginning of this war was an outbreak at Prague in 1419. Wenceslaus resided then at his castle of Kunratic, and when the news of the outbreak reached him, he fell into a fit of passion, and died of apoplexy on the 16th of August, 1419. He left no male issue, and his nominal successor in the kingdom of Bohemia was his brother, the emperor Siegmund.

WENTWORTH, THOMAS. [STRAFFORD.]

WERGELAND, HENRIK ARNOLD, a very distinguished Norwegian poet and political writer, was born on the 17th of June 1808 at Christiansand, where his father, Nikolai Wergeland, a cl-rgyman, was one of the assistant masters at the Latin school. The father, who was much respected, and who survived the son, was one of the deputies for Norway in 1814 Norway was severed by the allied powers from Denmark and united to Sweden, met and framed the constitution of Eidsvold, the acceptance of which by Sweden laid the foundation of a new and much more prosperous and glorious period in the annals of Norway. He was afterwards appointed priest of the parish of Eidsvold, the place from which the constitution takes its name, which is at the distance of about 40 English miles from Christiania; and it was there and at Christiania, first at the cathedral school and afterwards at the university, that his son received his education. It was in 1827 that Henrik Wergeland commenced his literary career under the assumed name of Sifuli Sifadda, by a farce or dramatic satire entitled 'Ah.' It was afterwards followed by twelve other farces of a similar kind, some in verse and some in prose, and mostly of an Aristophanic vein, with a political bearing and a seasoning of personalities. It was not surprising that these productions of Wergeland's early animosity of the parties to whom they referred, and for the ten years from 1827 to 1837 Wergeland's life was passed in what is familiarly called 'hot water.' His contributions to the Norwegian newspapers, some of which he occasionally edited, were very frequent; and his poems, many of which were on political subjects, were hardly less numerous. His admirers were at this time fond of calling him 'the Byron of Norway;' but Dr. R. G. Latham, who knew him personally, and in his 'Norway and the Norwegians' gives an interesting account of a visit to his native parsonage of Eidsvold, says that his pretentious rather reminded him of those of Elliott, the Corn-Law Rhymer, and that he might be called an 'Elliott Ossian.' His political feelings were intensely and exclusively Norwegian, and so narrow as to be antagonistical even to the other members of the Scandinavian family, the Danes and Swedes. For some time he was the whole youth of Norway with him, but in 1832 the appearance of an attack upon him by Welhaven, another rising poet and critic—'Henrik Wergelands Digtekunst og Polemik' (Henry Wergeland's Poetry and Polemics)—began to turn the current, though Wergeland's father wrote vigorously in his defence, and at present it may be considered that the public opinion of Norway is in favour of the united action of the three Scandinavian countries. It was regarded however as a great triumph of Wergeland's views that, in 1837, Sweden conceded the point of allowing a separate national flag to Norway. In the following year King Charles John (Bernadotte) paid a visit to Christiania, and Wergeland wrote a complimentary poem on the occasion, which was said to have been received by the sovereign with peculiar gratification. The Norwegian public was surprised soon afterwards that the king manifested his feelings by conferring on Wergeland, hitherto regarded as the chief 'radical' of Norway, an annual pension from his own privy purse, and a storm of indignation burst on the head of the poet. His position up to that time had been a somewhat precarious one. So far back as 1834 he had given up the clerical profession, after passing in 1829 his examination as candidate in theology, and officiating for some time as curate to his father. A poem which he had published, under the title of 'Creation, Man, and the Messiah,' which he regarded as his best work, and which many of his admirers declared themselves unable either to admire or comprehend, contained views and opinions which were not considered compatible with the position of a minister of the church; and the general freedom of his life and opinions was also against him. On quitting theology he studied medicine; in 1836 he was appointed keeper of the university library, and in 1840 keeper of the Norwegian archives. Giving up political writing after his pension, he devoted himself to poetry; and though his productions at this time did not meet with the enthusiastic reception their predecessors had enjoyed, it is now acknowledged that they are the best of his whole career. In 1840 he married, and was enthusiastically attached to his wife. But his constitution, originally athletic and corresponding with his stature of six feet three, was irrecoverably shattered by an immoderate indulgence in brandy, and he died on the 12th of August 1845, at the age of thirty-seven.

A collected edition of the principal works of Wergeland was commenced in 1851 by the Students' Society of Christiania, under the editorship of H. Lassen. The last volume we have seen of it is the eighth, published in 1856, and it was to be completed in nine. The editor, who had the task of collecting many of these writings from magazines, reviews, and newspapers, has also had that of adding notes, which on some occasions were necessary to render them intelligible to those not intimately acquainted with the passing history of Norway at the time during which they appeared. Three volumes of the eight are occupied with poetry, among which 'Jan Van Huysum's Flower-

Digitized by Google

Piece' and 'The Spaniarde' are considered by far the best. One volume is filled with the farces; two others with dramatic poems. An early tragedy, entitled 'Sinclair's Death,' is founded on a well-known incident in the annals of Norway, the destruction of a body of Scottish mercenaries in Swedish pay by a treacherous attack of the Norwegian peasantry. An opera entitled 'The Campbells,' and two tragedies, 'The Child-Murderess' and 'The Venetians,' are of particular merit. 'Creation, Man, and the Messiah,' is given in a revised and corrected shape, as left by the author. Of Wergeland's prose writings the most interesting are a volume of short biographies of distinguished Norwegians, and a history of the formation of the constitution of Eidsvold.

WERL, OLAF. (Vzerlius, Olavs.)

WERNER, ABRAHAM GOTTLOB, was born on the 25th of September 1750, at Wesau on the Queiss, in Upper Lausitz. His father was superintendent of a foundry at that place. He gave his son minerals as playthings, and young Werner thus became acquainted, says Cuvier, with their names and properties as soon as he learned the letters of the alphabet. He received his early education at the school of the orphan asylum at Dunslau in Silesia, but was afterwards placed at the celebrated school of mines at Freiberg in Saxony. He soon formed the resolution of entering into the mining establishment at that place; and as the regulations required a licentiate's degree in law before admission, he studied jurisprudence for three years at the University of Leipzig, but at the same time continued to cultivate a knowledge of mineralogy. At that University he published, in 1774, being then twenty-four years of age, a treatise on the external characters of minerals, in which he proposed a methodical and precise language to describe the sensible qualities of mineral substances. By this work, consisting of a few leaves, Werner, says Cuvier, rendered a service to mineralogy analogous to that which Linnæus had rendered to botanical science by the terminology made use of in his 'Philosophia Botanica,' and effected a revolution in the science of mineralogy. He here expressed his ideas on the deficiencies existing in mineralogical science, and on the means of removing them. He observes that the external characters of minerals had been neglected in their description; and at the same time he showed that these characters were not to be applied to the systematic distribution of minerals, but to determine the conception of their exterior, and to fix a method of describing them; that the external characters, previously employed by mineralogists, were indefinite, and that the great utility and utility of the external description of minerals depended on the complete definition and arrangement of the external characters. This work of Werner soon became popular in Germany, but it was several years before it became extensively known. A French translation, by Picardet, appeared in 1790, and one in English, by Mr. Weaver, was published in Dublin in 1805. In his native country it appears to have earned Werner a reputation, for in the year following its publication (1775), we find him appointed professor of mineralogy in the School of Mines at Freiberg and inspector of the mineralogical cabinet at that place. He held these offices for seventeen years.

In 1780 Werner published a translation of Cronstedt's Mineralogy, with notes, and in the following year a catalogue of the private collection of minerals of Prast of Dresden. In both these works he introduced his method of distribution and descriptions of minerals according to his terminology, giving the name 'Oryctognosy' to the study, while he termed the knowledge and science of the positions of minerals and fossils in the crust of the globe, and the consideration of the causes and the circumstances to be drawn as to the period and circumstances of their origin, 'Geognosy.' Although in the former department Werner had done great practical service, it is in connection with the latter division, and his theory of geology, that his name must be always associated.

In 1787 Werner published a little work on the classification of rocks, 'Kurze Klassifikation und Beschreibung der verschiedenen Gebirgsartou;' in which he points out the mineralogical distinctions of rocks, but the work contains none of Werner's theoretical views respecting formation, and the classification he has given in it was materially altered by him at a subsequent period. Werner now proceeded to teach in his lectures the doctrine of the formation of the primitive and other rocks by chemical precipitation from water; and in the same year, 1787, from an examination of the Erzgebirge (or Ore-Mountains), in Saxony, and the basaltic rocks of the neighbourhood, he extended the application of this doctrine to the origin of trap rocks. Raspe, a German, had as far back as 1768 described the basalt of Hesse as of igneous origin. To Werner's limited sphere of observation, his erroneous opinions on this and other subjects may in some measure be attributed. He found the basaltic rocks of Saxony and of Hesse forming the summits of the hills in tabular masses, and not occurring in dykes and veins, or extending downwards into the valleys, and hence some of the strongest proofs by which these rocks are now universally admitted to be of igneous origin were absent in the phenomena which came under his actual observation. But many even of the appearances in the neighbourhood of Freiberg, Werner appears to have overlooked or misconstrued. Thus within a day's journey of his school, the porphyry, called by him primitive, has been found not only to send forth veins or dykes through strata of the coal formation, but to overlie them in mass. The granite of the Harz mountains, on the other hand, which he supposed to be the nucleus of the chain, is now well known to traverse and breach the other beds, penetrating even into the plain (as near Goslar); and still nearer Freiberg, in the Erzgebirge, the mica-slate does not mantle round the granite, as was supposed, but abuts abruptly against it. (Lyell.)

These views of Werner were soon followed by the promulgation in his lectures of his Theory of Formations, which, of all that he taught, we are inclined to select as his greatest achievement in the science. His ideas respecting the division of rocks into great classes we have seen was not original, but he was the first to observe that "the masses or strata that constitute the surface of the globe present themselves in groups or assemblages, the members of which are generally associated whatever they occur, and are so connected as to exhibit a certain unity of character." These he termed 'formations,' and taught that "the exterior of the earth consists of a series of these formations laid over each other in a certain determinate order." This was a most startling announcement when we consider what a small portion of the globe had undergone a geological examination, and that even with that which had been examined, the authors of this bold theory had little practical acquaintance. But if this reflection increases our surprise, it must also increase our admiration of the sagacity which announced from such small data a truth which, connected and reasted at the time, now receives the assent of all geologists, and which extended observations in all parts of the globe confirms. Ideas of this magnitude are, says Cuvier, the true characteristics of genius.

Werner was lately however but the natural consequence of his notions respecting basaltic and other rocks, now deemed of igneous origin, he included the latter among his series of constant universal formations, and it is almost needless to say that this part of the theory has been as effectually disproved as the rest has been confirmed. Werner taught that these formations, including his primitive rocks, as well as his flötz or secondary rocks, were produced by a series of precipitations and depositions formed in succession from water, which he supposed to have covered the globe, and, existing always more or less perfectly, contained the different substances which have been produced from them. In almost necessary connection with this hypothesis, he supposed a number of successive and universal changes in the level of the sea, of very great extent.

In November 1791, Werner published his 'Theory of the Formation of Veins,' which at that time he taught for some years previously in his lectures. In this work he contended that veins were originally open fissures. He accounted for the existence of the fissures by supposing mountains to have been formed in the manner above stated, namely, by the retiring of the sea of beds of loose stony matter, and that the mass of these beds being at first wet, and possessed of little tenacity, the mountain yielded to its weight, cracked, and sunk down on the side where support was wanting; and that as the waters also, which assisted in giving them support, began to lower their level, the mass would more readily yield to its weight, and would fall on the side where least resistance was opposed. The shrinking of the mass in drying, and the operation of earthquakes, might, he supposed, have further assisted in the production of such rents. Having thus accounted for the origin of the fissures, Werner endeavoured to prove, that the materials filling the veins were introduced into them from above, and that the mass of veins have been formed by a series of precipitations from water, which have filled, in whole or in part, the spaces or fissures; that these precipitations entered by the superior parts of the rents which were open, and were formed by a solution in water, generally chemical, which covered the country in which these rents existed. To account for the high degree of crystallisation which prevails in the veins, he supposed that the precipitations and depositions which formed them were made with more tranquillity than those which produced beds and formations; that mechanical solutions and depositions had disturbed the formation of veins much less than of beds, and that the spaces in which veins are found preserved for a longer time the facility of receiving and retaining different solutions. (Playfair, 'Edin. Review,' vol. xviii.)

A French translation of the work, by D'Aubuisson, appeared at Paris in 1802, and an English translation by Dr. Anderson, at Edinburgh in 1809. This was the last work Werner wrote. It is said he had such a singular aversion to the mechanical act of writing, which he carried to such an extreme as never to reply to letters, and which even deterred him from reading them, least he should be tempted to reply.

In 1792 he was appointed Counsellor (Bergrath) of the mines of Saxony. Von Charpentier held the situation of Captain-general (Bergh hauptmann) in the same establishment, and there appears to have been a feeling of rivalry between the two officers, although the labours of Charpentier were principally confined to the practical details of mining. In 1795 or 1796 Werner introduced into his lectures the doctrine of a new class of rocks, to which, as lying between the primitive and secondary or flötz, he gave the name of 'transition.' The total number of distinct formations or rocks of all these classes to which he assigned precise relative places, was between thirty and forty. The establishment of the transition class completed Werner's labours, and the promulgation and further illustration of his views now occupied his lectures. He had at this time acquired a great celebrity

Digitized by Google

throughout Europe as the first geologist and mineralogist of the day, and was looked upon as the founder and author of mineralogy as a science. His fame was not so much acquired through his writings as by means of his lectures, for we have seen that some of his principal views were only promulgated in this channel. He was an admirable lecturer. One of his pupils describes his appearance in 1799 as very remarkable and striking at the first interview. He was middle sized, and broad shouldered; his round and friendly countenance did not at first sight promise much, but when he began to speak, he at once commanded the most marked attention. His eye was full of fire and animation, his voice from its slight tone was sometimes sharp, but every word was well-weighed; a cautious clearness and the most marked decision in the views he expressed were apparent in all that he said. With all this there was united a good feeling which irresistibly won every heart. His mineralogical investigations his discrimination of the most delicate distinctions was remarkable. In recognising and exhibiting these, his whole demeanour presented a combination of earnestness and assured conviction. Every single obscurity annoyed him, and he almost compelled his hearers to distinguish with the greatest possible certainty the most trivial relations in the mixtures of colours occurring in minerals, all the characters of which were classified with extrema minuteness, and every instance of deviation from his arrangement and every case of doubt, vexed and annoyed him. Although he employed no uniform method in the arranging together of his crystals, afterwards so successfully adopted by Haüy, yet the crystalline structure, the number of cleavages, and their relative position were materials in Werner's classification. Whoever, under his instruction, undertook a mountain expedition, received an extremely minute plan according to which he was to apply his observations. Every deviation, even the slightest, from the rules thus laid down, and every neglect of any portion of them, was severely blamed. It was necessary that he who wished to derive advantage from Werner's instruction, should give himself up to his master, for the whole subject was so intimately linked together, and the various elements of discrimination in mineralogy were so closely united with the mode of observation in geology, that the disturbance of any of them rendered all the others uncertain and doubtful. (Professor Steffens, 'Was ich Erlebte.')

He considered minerals under their chemical, economical, and even geographical aspects, and he arranged his collections under these different modes of treating the subject. He showed or attempted to show the influence of the mineral composition of rocks upon the habits, history, and even moral character of nations, and it was therefore he easily saw that his lectures had some points of interest even for the coldest minds. (Cuvier, 'Biographie Universelle.') He associated everything with his favourite science, and in his excursive lectures he pointed out all the economical uses of minerals, and their application to medicine; the influence of rocks upon the temperature, upon the soil; and of the soil upon the resources, wealth, and civilisation of man. The vast sandy plains of Tartary and Africa, he would say, retained their inhabitants in the shape of wandering shepherds; the granitic mountains and the low calcareous and alluvial plains gave rise to different manners, degrees of wealth, and intelligence. The history even of languages, and the migration of tribes, had been determined by the direction of particular strata. The qualities of certain stones used in building would lead him to descant on the architecture of different ages and nations; and the physical geography of a country frequently invited him to treat of military tactics. The charm of his manners and his eloquence kindled enthusiasm in the minds of his pupils; and many who had intended at first only to acquire a slight knowledge of mineralogy, when they had once heard him, devoted themselves to it as the business of their lives. (Cuvier, 'Éloge de Werner;' Lyell, 'Principles of Geology,' vol. 1.)

This extended and popular treatment of the science attracted some, while others to whom the love of science for science sake was not a sufficient inducement, became his pupils from the connection that his lectures, from the situation he filled, necessarily had with mining. Among his pupils or attendants on his lectures may be enumerated Alexander Humboldt, Von Buch, D'Aubuisson, Jameson, Broechi, Napione, Freiesleben, Raumer, Englehart, Karsten, Hohe, Hertzer, Wiedemann, Lemmerling, Renss, Steffens, Breithaupt, Esmark, Wad (Denmark), D'Andrada (Brazil), and Elhyar (Spanish Mexico). In consequence of Werner writing so little, and his lectures not being preserved, it is to the works of many of these pupils that recourse must be had to acquire a perfect acquaintance with the details of their preceptor's views, and the gradual extension of his theories and discoveries. That Werner's powers of external discrimination were extremely acute, we have seen in speaking of him as a mineralogist, and his unrivalled tendency for classifying on his mineralogical studies fully fed by an abundant store of observation; but when he came to apply this methodising power to geology, the love of system, so fostered, appears to have been too strong for the collection of facts he had to deal with.

To return to the biography of Werner. In 1802 he visited Paris, and was received with great honour by the scientific and learned bodies. The Academy of Sciences elected him one of their eight foreign associates; and the leaders of the French republic sent him a diploma as 'Citoyen,' an honour which somewhat perplexed Werner, as he was a loyal Saxon, and firmly attached to his prince. Werner was so devoted to his country that he never would enter into any other service, although the most tempting offers were repeatedly made to him.

Warner suffered for many years uninterruptedly from a stomach complaint. The distresses of his country, consequent upon its being made the theatre of the campaign of 1813, seem to have preyed upon his mind, increased his malady, and produced a complication of diseases from which he never rallied. In 1817 he went to Dresden, in the hope of obtaining some relief from his sufferings. He became worse, and died there on the 30th of June, in the arms of his sister, in the sixty-seventh year of his age. Berlinger pronounced his funeral oration: Ritter delivered his 'Éloge' at the Academy of Munich, and Baron Cuvier at the Academy of Sciences in Paris. Werner was never married. He had surrendered in his lifetime the whole of his valuable collection of minerals, comprising upwards of 100,000 specimens, and also a large collection of Greek and Roman medals, to the School of Mines at Freiberg, for 40,000 crowns, a price considerably below the value; and in consequence of the distressed state of Saxony at that period, he accepted only a small part of the reduced sum, reserving a moderate interest upon the remainder under the form of an annuity, and bequeathing the capital after his death to the academy in which he had been more than forty years the most distinguished professor.

WERNER, FRIEDRICH LUDWIG ZACHARIAS, an eminent German dramatic, was born on December 18, 1768, at Königsberg, in East Prussia, in the university of which town his father was professor of history and rhetoric. The death of his father left him at an early age to the sole care of his mother, a woman of considerable talent and of a lively imagination. In 1784 he began to prepare for the civil service, and attended lectures on jurisprudence and finance in Königsberg, and also those of Kant, to which he gave much attention. In 1793 he entered the Prussian civil service as secretary in the Finance department, in which capacity he lived for a considerable time at Warsaw, which had recently been taken possession of by Prussia. In 1800 he there produced his first dramatic work, 'Die Söhne des Thals,' a work distinguished by the simplicity of its plot, its successful characterisation, depth of feeling, and power of language. On February 24, 1804, his mother died at Königsberg on the same day with his friend Hagelstein, and the sad remembrance gave rise to the his most celebrated tragedy, 'Der vierundzwanzigster Februar,' a play elevating itself far above those of later imitators in a similar style by a terrible originality, a keenly penetrating insight into the human heart, an admirable arrangement of the scenes, a rare and discriminating use of language. After his return to Warsaw he wrote 'Das Kreuz an der Ostsee' (The Cross on the Baltic), for which G. T. A. Hoffmann composed the music. In 1805 he was removed to an official situation in Berlin, but his mind, always eccentric, became now more and more disordered by mysticism. His imagination was strongly excited, and an irrepressible desire for change possessed him, with an almost total want of stability. He gave up his office and separated from his wife, an amiable Polonese, whom he had married in 1799, after having divorced two other wives. He then wrote for the Berlin theatre, 'Martin Luther, oder die Weihe der Kraft' (The Consecration of Strength), in which he mixed up history with mysticism, but which has fine poetical passages. After this he wandered through Germany, and remaining at Weimar for three months, returned to Berlin in 1806. His stay was short there; he travelled into Switzerland, and at Interlaken became acquainted with Madame de Staël-Holstein. In the autumn of the same year he was in Paris, and in December again at Weimar, where the duke bestowed a pension on him, while almost at the same time the Grand Duke of Hesse-Darmstadt created him a counsellor of state. He next resided for four months at Coppet with Madame de Staël and A. W. Schlegel, and afterwards, on their recommendation, proceeded to Rome in 1809. In April 1811 he was secretly admitted as a member of the Roman Catholic Church, and for this purpose studied theology until 1813, having resolved to be seminary at Aschaffenburg, he was consecrated priest, went to Vienna during the sitting of the Congress in the autumn of that year, commenced preaching, and attracted large audiences. Part of the years 1816-17 he passed in Poland. Soon after his return to Vienna he quitted, to the great surprise of the public, the order of the Redemptorists into which he had been admitted two or three years previously, though he still continued to preach. In 1820 he wrote his last tragedy, 'Die Mutter der Makkabäer,' which, with passages of considerable poetical beauty, evinces the same striving after novelty shown in his other pursuits. He affects a roughness of language, a rude and often indelicate humour, widely different from his earlier works, but of which some of his intervening ones had shown symptoms, for during all this vacillation of opinion and constant change of course, he had not lost or altogether neglected his poetical powers, though the changes he had adopted in their development were by no means improvements. He had written 'Attila, König der Hunnen,' 'Wanda, Königin der Sarmaten,' 'Kunegunda,' and other poems, among which were hymns, that do not add greatly to his reputation as a poet. As a preacher he was popular, but his sermons, while they possess an attractive and inventive manner of explanation and illustration are disfigured by poor witticisms not unfrequently irreverent, and an obtrusive humility. He continued to preach until a short time before his death, which happened on January 18, 1823. His dramatic works were collected and published

Digitized by Google

in 1817-18 in six volumes, containing all but the 'Mother of the Maccabees.' In 1836 his posthumous sermons were published, and in 1839-41 a complete edition of his collected works in fourteen volumes.

WERNER, JOANNES, a German mathematician and astronomer, was born at Nürnberg on the 14th of February 1468. Nothing apparently is known of his life, except that, when he was twenty-five years of age, he went to Italy, where he made some astronomical observations; and he is said to have made a series of observations on the comet which appeared in the month of April 1500. From observations which he made on the positions of Regulus, a Virginis, and a Libræ, compared with those which had been assigned to the same stars by Ptolemy and Alphonso, he determined the precession of the equinoxes to be 70 minutes of a degree in 100 years, a quantity much too small; and he found the obliquity of the ecliptic to be 23° 28'.

In 1514 he published 'Annotationes on the First Book of Ptolemy's Geography,' in which he endeavoured to explain an obscure passage concerning the projection of the celestial sphere on a plane surface; and it deserves to be remarked that in this work we find the first notice of the method of determining geographical longitudes by the angular distance of the moon from some star: he recommends, for making the observation, the 'cross-staff,' or 'fore-staff,' a rude instrument which has long since been disused by mariners. In 1522 he published at Nürnberg, in 4to, his 'Opera Mathematica,' in which is contained a tract on conics: he also published a work on trigonometry, in five books, containing a great number of astronomical and geographical problems.

Werner wrote explanations of the construction and uses of meteorological instruments; and it is said that he collected a number of observations with a view of discovering from them rules for determining the changes which take place in the atmosphere. He executed a machine in which the movements of the sun, moon, and planets were represented conformably to the Ptolemaic system; and he wrote a work on 'The Movement of the Eighth Sphere.' He died in the year 1528.

WESLEY, JOHN, was the most distinguished member of a family, several of the other members of which however also claim to be shortly noticed, either on their own account or in consequence of their connection with him. It will be most convenient to comprise all the Wesleys under one head, and to take them in chronological order.

The Wesleys, or Westleys, as they formerly spelled their name, are said by Dr. Adam Clarke, in his 'Memoirs of the Wesley Family,' to have believed of their progenitors to have come to England from Saxony, and it has been suggested that they might possibly have been of the same stock with the once famous reformer, John Wesselius, otherwise De Wesalia, or Basilius, of Groningen, who died in 1489. (See 'Biographical Notices of the Rev. Thomas Wesley, &c., by William Beal, 8vo, London, 1839; and WESSEL.) Supposing the name to be English, or Anglo-Saxon, a doubt has been entertained as to whether it is properly Westleigh or Welleseligh. There is reason to believe that the family name of Welleseligh (probably taken from the village so called near the city of Wells) has generally passed into Wesley or Wood, in the 'Athenæ Oxonienses,' has a notice of a bishop of Kildare, of the early part of the 16th century, whom he describes as 'Walter Wellesley, commonly called Wesley;' and it is known that, when John Wesley's younger brother Samuel was at Westminster School, an Irish gentleman, Garret Wellesley, or Wesley, Esq., M.P. for the county of Meath, considering the boy to be of his own family, offered to make him his heir if he would have relinquished the intention of proceeding to Oxford, and gone over and settled in Ireland. This was before 1727, in which year Mr. Wellesley died, leaving his estates and also his name to his cousin, Richard Colley, Esq., who was created Baron Mornington (in the Irish peerage) in 1746, and was the father of the first Earl of Mornington, t e grandfather of the Marquis Wellesley and the Duke of Wellington. [See WELLINGTON, DUKE OF, col. 539.]

THE REV. BARTHOLOMEW WESTLEY is the first of John Wesley's ancestors of whom there is any distinct record. He was born about 1600; was educated at one of the universities, where he studied both divinity and medicine; became, in the time of the Commonwealth, minister of Charmouth and Catherston Coleing, villages in Dorsetshire (not Lyme in Dorsetshire); and was ejected from the first of these livings immediately after the Restoration, and from the second on the passing of the Act of Uniformity in 1662. He continued to reside at Charmouth, practising physic, till the passing of the Five-Mile Act in 1665 drov- him, with other nonconformists, to a secluded spot at Pinney, now known by the name of Whitechapel Rocks; and there he is believed to have spent the remainder of his days, which appear not to have been many, though we do not find the date of his decease stated. "He lived several years," Dr. Calamy tells us, "after he was legally silenced; but the death of his son made a very sensible alteration in the father, so that he afterwards declined apace, and did not long survive him."

THE REV. JOHN WESLEY, M.A., son of this Bartholomew, was born about 1636, and studied at New Inn Hall, Oxford, where he applied himself particularly to the Oriental languages, and adopted the opinions as to church government and other subjects of the vice-chancellor of the university, the celebrated Dr. Owen, who is said to have shown great kindness for him. After preaching for some time to what was called "the gathered church," at Weymouth, and at the neighbouring village of Radipole, he was appointed in May 1658 to the vicarage of Winterborne-Whitehurch, in the same county of Dorset. He married a daughter of Mr. John White, one of the lay assessors of the Westminster Assembly of Divines, and commonly called 'the Patriarch of Dorchester,' in which town he was rector of Trinity Church for about forty years. Mrs. Westley is also stated to have been a niece of Dr. Thomas Fuller, the celebrated historian: it is probable that she was his wife's niece. Westley appears to have been thrown into prison for something he had uttered in the pulpit very soon after the Restoration: he lay in confinement till he was discharged by an order of the privy council, dated July 24, 1661, on his taking the oaths of supremacy and allegiance. He was seized a second time in the beginning of 1662 as he was leaving the church, and carried to prison at Blandford, where he lay for some time; and soon after he got out the Act of Uniformity deprived him of his living, and left him for several months a wanderer and an outcast. At length, in May 1663, a pious and charitable person gave him a house rent-free at the village of Preston, a few miles from Weymouth. At one time he thought of emigrating to Surinam or Maryland; but he finally resolved that it was his duty to remain at home. He continued to preach when he could find a safe opportunity, both at Preston and Weymouth; and he eventually united himself as pastor to a small congregation at Poole, though without going to reside among them. He was often apprehended and thus escaped, and, besides being several times fined, was subjected to four imprisonments at Poole and Dorchester. Yet this elder John Westley does not appear to have been a person of extreme opinions, or one who habitually allowed his zeal to hurry him into disregard of danger or other inconvenience. His principle and his practice was to join on ordinary occasions in public worship with the members of the Established Church; and we are told that, while some of his nonconformist brethren in Dorset preached and administered the ordinances of religion to the small congregations who acknowledged them as their pastors openly and at all hazards, he "thought it his duty to beware of men—that prudently he should preserve his liberty and his opportunity to minister in holy things as long as he could, and not by the openness of one meeting to hazard the liberty of all meetings." (Beal, p. 27.) The Five-Mile Act however, which drove his father from Charmouth, drove him also from Preston, and forced him to retire to some place of concealment which does not appear to be known. Venturing forth again some time after to visit his family and to preach to his congregation, he was apprehended and committed to the common gaol. Many more hardships incident to his situation he also underwent, and it seems to be intimated that his spirits at last sunk under the public and personal afflictions with which he was tried. If he was only three or four and thirty, as Southey states (Life of Wesley, i. 5), when he died, that event must have been before or in the year 1670. His death, as already mentioned, was speedily followed by that of his father, at about double the age.

THE REV. SAMUEL WESLEY, or WESLEY, was a younger son of this John Westley, and was born at Preston, according to one account in 1668, by another in 1666, by a third "about the year 1662, or perhaps a little earlier." (Compare Beal, p. 31, and Southey, i. 7, where it is remarked that the earliest date is established by certain extracts from the registers of Exeter College, which are given, but which do not appear to us to prove any thing on that subject.) He is said to have been designed by his father for the ministry among the Dissenters, and to have been sent with that view, after leaving the free grammar-school of Dorchester, first to the academy at Stepney, kept by Edward Veal, D.D., and next to that kept by Charles Morton, M.A., at Newington Green. Wesley however soon left the Dissenters. When he joined the Established Church he was abandoned by his relations; but making his way to Oxford, with only 2l. 16s. in his pocket, he entered himself at Exeter College as a poor scholar; and, although he had never after received from any of his friends was a matter of five shillings, he managed to take his Bachelor's degree, and by acting as a private tutor had accumulated the sum of 10l. 15s., when he proceeded to London and got ordained. In all the accounts that we have examined it is asserted that the sum by which he went to college was 16s., and one of the extracts which Southey prints certainly seems to imply that he made a deposit of caution-money as a poor scholar on the 26th of September in that year; but it will be found that this date will not agree with the rest of his history as commonly related. At all events it is clearly impossible that if he only became a member of the university in 1684, he could, as we are told, have taken his degree of B.A., been ordained, served a curacy in London for a year, been for another year on board a man-of-war as chaplain, and then served another London curacy for two years, during which he married, had a son, became known as a writer for the press, and got a small living in the country (supposed to be that of South Ormsby, in Lincolnshire), all before James II. published the order in council commanding his Declaration for Liberty of Conscience to be read in the churches, in May 1688. At this time Wesley is represented as having been a person of such importance that urgent solicitations and promises of preferment were addressed to him to induce him to support the measures of the court, which however he resolutely refused to do; not only omitting to read the king's declaration, but preaching a

Digitized by Google

pointed discourse against it before an audience composed in great part of courtiers, soldiers, and informers.

Other facts equally go to strengthen the improbability of his having gone to college only in 1684. It is stated to have been after he returned from see that he married Susannah, youngest daughter of the Rev. Dr. Samuel Annesley, one of the most eminent of the London nonconformist clergy, and a near relation of the Irish Earl of Anglesey. This lady, as appears from one of her own letters, which has been printed, had, like her husband, of her own accord left the Dissenters, and that at the early age of not full thirteen, after having, as she intimates, thoroughly examined the controversy between them and the Established Church. Another daughter of Annesley (who had originally held a living in the Church, and was ejected by the Act of Uniformity) was the first wife of the eccentric John Dunton, bookseller, publisher, and author, in whose curious autobiographical performance entitled his 'Life and Errors' there are several notices of his brother-in-law; and Dunton published for Wesley the first work that had his name, an octavo volume of verse, entitled 'Maggots, or Poems on several subjects,' which appeared in 1685. Wesley, besides being already married to Miss Annesley, appears to have been at this time an established writer, though only anonymously, for the booksellers.

When the revolution took place, Wesley, it is said, wrote a book in defence of it; but neither the date nor even the title is given. As it is said to have been dedicated to the queen—who in consequence, we are told, gave the author the living of Epworth, in Lincolnshire, in 1693—it may possibly have been not anything concerning the revolution, but an heroic poem, in folio, entitled 'The Life of Christ,' which he published that year and dedicated to her majesty, and which was reprinted, with large additions and corrections, in 1697. Another still larger volume of verse, under the title of 'Elegies on Queen Mary and Archbishop Tillotson,' followed in 1695; 'The History of the New Testament attempted in verse, and adorned with 152 sculptures, done by J. Sturt,' 12mo, in 1701; and 'The History of the Old Testament in Verse, with 180 sculptures, by Sturt,' 12mo, in 1704. In 1705 Wesley published a poem on the battle of Blenheim, for which the Duke of Marlborough made him chaplain to one of the regiments then stationed in England, and would, it is said, have procured him a prebend, had it not been for the influence of the Dissenters at court and in parliament, which was powerful enough not only to prevent this promotion, but soon after to procure the removal of Wesley from his chaplaincy. In the next reign however he received and held with Epworth the small living of Wroote in the same county. He died on the 30th of April 1735, and the same year appeared, under the name of his eldest son, his most elaborate work, entitled 'Dissertationes in Librum Jobi,' a Latin commentary on the Book of Job, for the publication of which proposals had been first circulated in 1729. 'A Treatise on the Sacrament' is mentioned, without date, in a list of Samuel Wesley's publications in Nichols's 'Select Collection of Poems,' ii. 99; and he is stated by his son John, in his 'History of England,' to have been the author of the defence delivered by Dr. Sacheverell before the House of Lords. His poetry is occasionally harsh in expression, but is not without real animation; and many of his epigrams are elegant and even elevated. By his wife, who was in many respects a very remarkable woman, he had a family of nineteen children, of whom one daughter, Mehetabel, who made an unfortunate marriage with a person of the name of Wright, evinced much literary talent, and was the mother of Mrs. or Miss Mehetabel Wright, who distinguished herself as a modeller in wax; and three sons, Samuel, John, and Charles, all attained more or less celebrity.

The Rev. Samuel Wesley, the Younger, was the eldest, or at least the eldest surviving, son of the Reverend Samuel Wesley of Epworth. He is stated to have been born at Wroote, Whitehead, in his 'Life of Wesley,' says about 1692; Coke and Moore, in 1690. Yet the latest of these dates, it will be observed, is earlier than that assigned for his father's induction to the living of Epworth. It is related that he was four years old before he spoke a word; but from that time he spoke not only without any difficulty, but with an understanding above his years. He was sent to Westminster School in 1704, was admitted a king's scholar in 1707, and in 1711 was elected to Christ's Church, Oxford, where he remained at least till he had taken his degree of M.A. He had acquired much reputation for his proficiency in classical learning both at school and at the university, and he was now appointed one of the ushers of Westminster School, in which situation he remained for nearly twenty years. He had taken holy orders soon after leaving college; but he never obtained any preferment in the church, though his religious convictions appear to have been strong, and his epitaph, besides giving him a high character both for benevolence and piety, says that he was an excellent preacher—adding that his "best sermon was the constant example of an edifying life." It is understood that his friend Bishop Atterbury and many of the other Tory wits of the day, and his warm advocacy or avowal of the principles of that party, stood in the way of his advancement. Both he and his younger brothers, John and Charles, as it has been observed, seem to have imbibed their political opinions from their mother, who, although she concealed her sentiments during all the reign of King William, differed from her husband in his approval of the Revolution—a fact which the latter only discovered by perceiving that in the king's last illness she did not say "Amen" to the prayers for his recovery. But Samuel carried both his political toryism and his high-church notions much further than his brothers, whose "new faith," as he termed it, and canonical irregularities, he viewed with great concern and disapprobation. But he scarcely lived to see more than the beginning of Methodism. In 1732 he was appointed head master of Tiverton School, in Devonshire; and there he resided till his death, 6th of November, 1739. He is the author of a collection of poems, first published in 4to, in 1736, and a second time in 8vo, in 1743. Some of them, especially those of a humorous cast, have much merit. The collection of 'Original Letters by the Reverend John Wesley and his Friends,' published by Dr. Priestley in an 8vo volume, at Birmingham, in 1791, consists for the most part of the correspondence between Samuel Wesley and his brothers, obtained from Samuel's daughter and grand-daughter.

The Rev. John Wesley, the most eminent person of his name and family, was the second, or the second who grew up to manhood, of the sons of the Reverend Samuel Wesley, of Epworth, and was born there, 17th of June (o. s.), 1703. He was still very young when he was sent to the Charter-House, whence, at the age of seventeen, he proceeded to Christchurch, Oxford. The account of his official biographers, Coke and Moore, is, that having taken the degree of B.A., he was elected Fellow of Lincoln College in 1724, was ordained by Potter then bishop of Oxford, afterwards archbishop of Canterbury, in 1725, and graduated as M.A. in 1726 (pp. 42 and 47). Southey's account, which is probably correct, is that he was not elected to his Fellowship till March 1726. In the end of the same year he was appointed Greek lecturer and moderator of the classes.

From his earliest years Wesley had been of a serious temper, and more especially from the commencement of his residence at college religious impressions had taken a strong hold on him. It is related that two books in particular, which he read in the course of his preparations for ordination, produced a powerful effect on him;—the treatise 'De Imitatione Christi,' attributed to Thomas à Kempis, and Jeremy Taylor's 'Rules of Holy Living and Dying.' From about the time when he was ordained he began to keep a diary, a practice which he continued to the end of his life. A large portion of this record, under the title of his 'Journal,' was published by himself, in 21 parts, and has been several times reprinted.

Soon after he was ordained, he went to officiate as curate to his father at Wroote, and here he resided for about two years; during which time, in 1728, he received priest's orders from the same prelate by whom he had been ordained deacon. It appears to have been in the end of this year that he was summoned back to college, in consequence of a regulation that such of the junior fellows as might be chosen moderator, should perform the duties of their office in person. Here he found his younger brother Charles, then an undergraduate of Christchurch, one of a small association of students already distinguished in the university by the derisive appellations of the Holy Club, the Godly Club, the Bible Moths, the Bible Bigots, the Sacramentarians, and the Methodists. At first, we are told, their religious enthusiasm only carried them the length of devoting Sunday evenings to the exercises of divinity, the other nights being given to classical studies; but very soon religion became the sole business of their meetings; they communicated once and fasted twice a week, employed much of their time in visiting the prisons and the sick, gave away whatever they could spare in charity, observed among themselves a regular system of prayer, meditation, and self-examination; in short, exhibited in all things a zeal and abstraction from the world such as has scarcely been surpassed by the most rigid order of monkish devotees. John Wesley appears to have immediately joined this society, which now consisted of about fifteen individuals, of whom the most remarkable, besides the two brothers, were Mr. Morgan, whose mortifications are supposed to have shortened his life, James Hervey, the well-known author of the 'Meditations,' and George Whitefield, who shares with Wesley the fame of having been one of the two chief founders of Methodism.

It was very soon after this that Wesley became acquainted with William Law, the author of the 'Serious Call' and other similar works; the two brothers used to travel from Oxford on foot two or three times a year to visit Law at his house in the neighbourhood of London, and his conversations and written writings had the chief share with their own previous notions and feelings, exerted a powerful influence over them. Meanwhile however the less ardent or resolute of their Oxford associates dropped off one by one; and the number, which had at one time been seven and twenty, declined at last to five. Most of this had happened during the absence of the two Wesleys on a short visit to their parents, in 1732. In these circumstances, when, the next year, it was proposed that he should apply for the next presentation to his father's living of Epworth, John Wesley came to the resolution that it was his duty rather to remain at the university, as the field where his exertions were most needed, and where also they were likely to find the greatest stimulus. Nevertheless a few months after his father's death he was induced to go out with General Oglethorpe to Georgia, in North America, to preach to the settlers and Indians in the colony which the general was founding there. He and his brother Charles, who now took holy orders, sailed from Gravesend on the 14th of October 1735, in the same vessel with a party of six and twenty Moravians. They anchored in the Savannah River on the

Digitized by Google

6th of February 1736. Charles returned to England, sent home by Oglethorpe with despatches, early in 1737; John remained in America till the close of that year. The most remarkable incident of this part of his history is the affair in which he became involved with Miss Sophia Causton, niece of the chief magistrate of Savannah, whose partiality he for some time encouraged, but whom he eventually, on the advice of his Moravian friends, declined to marry. On this disappointment Miss Causton married Mr. Williamson; and soon after Wesley refused to admit her to the communion, upon which her husband indicted him for defamation, laying his damages at 1000*l*. The affair was never brought to an issue; but it was the occasion of driving Wesley from the colony, which he left on the evening of Saturday, the 3rd of December 1737, shaking the dust off his feet, to use his own expression, after a residence of one year and nine months. The whole of this unhappy account which his followers give of this matter may be read in Coke and Moore (pp. 114-130).

He reached England February 1st, 1738. While he had been abroad, the religious excitement which now began to be generally known by the name of Methodism had made great progress in London, Bristol, and other parts of the south of England, under the impulse of the enthusiastic preaching of Whitefield, who had sailed from the Downs for Georgia only a few hours before the vessel which brought Wesley back from thence cast anchor there, the two ships in fact passing in sight of each other. As soon as he arrived in London, Wesley hastened to renew his connection with the Moravians. It was not however till some months after this, that, according to his own account, he for the first time attained to true views of Christianity. His conversion, we are assured, took place about a quarter before nine o'clock on the evening of Wednesday, the 24th of May, at a meeting, to which he had gone very unwillingly, of "a society in Aldersgate-street, where one was reading Luther's 'Preface to the Epistle to the Romans.'"

About three weeks after his 'new birth,' on the 15th of June, he set out for Germany, to visit the Moravian brethren at their original seat of Herrnhut. He met Count Zinzendorf, the head of the Moravians, at Marienborn, was brought before the prince royal of Prussia (afterwards Frederick the Great) at Weimar, and having reached Herrnhut, in Upper Lusatia, on the 1st of August, remained there for about a fortnight, and then set out on his return to England, where he arrived about the middle of September. From this date the history of Wesley merges in the history of Methodism; and all we can attempt here is to note briefly the succession of the principal events and circumstances with which he was personally most concerned.

Whitefield returned from Georgia in the latter end of 1738; and he and Wesley immediately again became intimately associated. The example of preaching in the open air, first set by Whitefield on the 17th of February 1739, was shortly after followed by Wesley at the same place, the neighbourhood of Bristol. The first separate meetinghouse for the Methodists was begun to be built in the Horse Fair, near St. James's church, Bristol, on the 12th of May in that same year. Lay preaching, of which the first example had been set by an individual named Bowers, in Islington churchyard, after a sermon by Whitefield, was, not without some hesitation, sanctioned by Wesley soon after his return to London in the autumn. This last movement in particular gave to Methodism in most people's eyes the distinct appearance of a schism in the church. Accordingly, when, before the end of the year, Wesley's mother professed her accordance in his views, her son Samuel wrote to her expressing the exceeding concern and grief with which he had heard that she countenanced the spreading delusion so far as to become a member of Jack's congregation. The old lady had, like her son John, been converted in a moment—and from that time continued to live with him, and to attend his ministry till her death in 1742.

In July, 1740, Wesley solemnly separated himself from the Moravians, with whom he had now come to differ, or had discovered that they differed from him, on some fundamental points of doctrine; and soon after he broke with Count Zinzendorf, the two parting, say his official biographers, "without the least prospect of a reconciliation." Their last interview took place in Gray's Inn Walks. His separation from Zinzendorf and the Moravians, which made the two parties immediately bitter enemies, was followed before the close of the same year by a breach with Whitefield, which however although it divided the new religionists into two permanently distinct bodies, only suspended for a time the friendship and mutual regard of the two fathers of Methodism.

From this time Wesley's life was spent in preaching, travelling, writing books, and laboring in all other possible ways for the consolidation and extension of the new church, the management of which was now wholly in his own hands. No man ever gave himself up more entirely to any object, or prosecuted it either with more zeal and determination, or more method and skilful management. Not an hour, scarce even a minute, was abstracted from the service of the cause on which he had set his heart; and rarely has any ambition been so well seconded by the other qualities and habits of mind, and, it may be added, of body too, necessary to sustain it and give it full effect. He rested nowhere, seldom riding less than forty, fifty, or sixty miles a day; even on his journeys from place to place he read and wrote; and he generally preached three or four times, sometimes five times, a day. For a long time he usually travelled on horseback; latterly he used a chaise; "nor do we believe," say his official biographers, "there could be an instance found, during the space of fifty years, wherein the severest weather hindered him even for one day."

About the year 1750, soon after his brother Charles had become a husband, Wesley married Mrs. Vizelle, a widow with four children. This step at first made a little awkward at first by his having a few years before published a tract entitled 'Thoughts on a Single Life,' in strong recommendation of celibacy for all who were able to subject themselves to that restraint. The marriage turned out a very unhappy one: Wesley, who had stipulated that he should not preach one sermon less than usual on account of his change of condition, found his wife little at home: the lady became jealous; robbed him of his substance, as he states in one of his letters, to prevent his giving it to bad women; and committed sundry other extravagances and outrages. Wesley had high notions of the authority of a husband, and the superiority of his own sex: "Know me," he wrote to her, "and know yourself. Suspect me no more, asperse me no more, provoke me no more; do not any longer contend for mastery, for power, money, or praise; be content to be a private, insignificant person, known and loved by God and me. Attempt no more to abridge me of my liberty, which I claim by the laws of God and man; &c, &c. . . . Of what importance is your character to mankind? If you was buried just now, or if you never lived, what loss would it be to the cause of God?" The end was, that after she had several times run away from him and been induced to return, she made the experiment once more, and was not asked to come back. "Non eam relipni," says Wesley in his journal, "non dimisi, non revocabo—I did not forsake her, I did not dismiss her, I will not recall her." This was in 1771. She lived for ten years longer, and died at Camberwell, where a stone is placed at the head of her grave, bearing a setting forth that she was "a woman of exemplary piety, a tender parent, and a sincere friend." She bore no children to her second husband.

Wesley died after a short illness at his house in London, on the 2nd of March 1791, in the eighty-sixth year of his age. His publications are far too numerous for us to attempt any account or even an enumeration of them: among the most remarkable, besides his Journal, are—a corrected translation of Thomas-à-Kempis, said to have been published by him in 1735, a short time before his departure for America; various collections of hymns, of which however were written by his brother Charles; a History of England; a short Roman History; 'Primitive Physic;' and many short tracts on theological subjects. There are at least two collected editions of his works: one in 32 vols. 8vo, printed immediately after his death; another in 51 vols. 8vo, published in 1809. The 'Arminian Magazine,' now called the 'Methodist Magazine,' was established by Wesley in 1780, and was conducted under his superintendence so long as he lived.

Of several lives that have been written of Wesley, the two principal are that compiled immediately after his death by Dr. Thomas Coke and Mr. Henry Moore, to whom all his manuscripts were left, and published in one volume, 8vo, 1792; and that by the late Dr. Southey, in 2 vols. 8vo, London, 1820. Prefixed to the latter is a list of the chief printed materials for the biography of this extraordinary man.

THE REV. CHARLES WESLEY, the younger brother of John Wesley, was born at Epworth in 1708, and was educated at Westminster School under his brother Samuel, his school-bills there for several years being discharged by the relation or namesake who, as related above, offered to make him his heir if he would accompany him to Portugal. He was elected to Christchurch in 1726, and from this time his history makes part of that of his brother, with whose labours in the diffusion of his religious views and in the establishment of Methodism he was associated from their commencement. It was at his instance that the scheme of life he had laid out for himself, which was to spend his days at Oxford as a tutor, that he was prevailed upon, in 1735, to take orders, and to accompany his brother to Georgia. After their return from America, they had occasional differences upon points both of doctrine and practice, but none that ever produced any serious dissension. In 1749 Charles was married by his brother, at Garth in Brecknockshire, to Miss Sarah Gwynne, a lady of a good family in that county. After his marriage he confined his ministrations almost entirely to London and Bristol. Charles Wesley was an able preacher, and "possessed," say Coke and Moore, in their Life of his brother, "a remarkable talent of uttering the most striking truths with simplicity, truth, and brevity." He early showed a turn and talent for writing in verse; and most of the new hymns published by John Wesley in his various collections were of Charles's composition. "In these hymns," observes his brother, in one of his prefaces, "there is no doggerel, no botches, nothing put in to patch up the rhyme; no feeble expletives. Here is nothing turgid or bombast on the one hand, or low and creeping on the other. Here are no cant expressions, no words without meaning. Here are (allow me to say) both the purity, the strength, and the elegance of the English language, and at the same time the utmost simplicity and plainness, suited to every capacity." This is a just character of Charles Wesley's poetry, both in his hymns and other compositions. Harmoniously as the two brothers co-operated throughout their lives, they were very unlike in

Digitized by Google

character. Charles appears to have been naturally of a quiet and domestic disposition, with little ambition or love of management and power; and, with all his sincere and fervent piety, so far from any inclination towards asceticism, as to be rather a lover of laughter and other joyous emotions, which his brother counted it almost a sin to indulge in. Charles died in London on the 29th of March 1788. Two of his sons, whom (contrary to his brother's wish) he had educated as musicians, became very distinguished in their profession.

WESLEY, CHARLES and SAMUEL, sons of the Rev. Charles Wesley (see the preceding article), are both entitled to our notice as remarkable instances of a different and unquestionable manifestation of musical genius, during almost the earliest periods of infancy.

CHARLES WESLEY was born in 1757; and the Honourable Daines Barrington, who has devoted several pages of his 'Miscellanies' to the youthful Wesleys, tells us, on the authority of their father, he, Charles, could "play a tune on the harpsichord readily, and in good time, when he was only two years and three-quarters old;" and that when he played, his mother "used to tie him up by his backstring to the chair, for fear of his falling. . . . Whatever tune it was, he always put a true bass to it." He became a fine performer on the organ and harpsichord; at a time however when the art of playing on keyed instruments, and indeed on all other musical instruments, was far behind what it is in the present day, and only advancing to that state of perfection which it has since reached. He early in life was brought under the notice of Lord Mansfield, who was so pleased with him, and he had the honour to entertain the king, in hours of royal leisure, by his performance of Handel's music. He was also much patronised by the upper classes, for the sake of his practical skill, and highly esteemed by all for his moral worth, for the simplicity of his manners, and his amiable qualities: but, as too often happens in instances of premature development of genius, the flattering promises of his youth were not fulfilled in future years. After attaining a certain degree of excellence as a mere performer, he remained stationary; and, as regards composition, left not, we believe, any proof that he had ever passed the boundaries of mediocrity. He held during many years the appointment of organist to St. George's, Hanover-square. He died unmarried in 1815.

SAMUEL WESLEY was born in 1766. "The seeds of harmony," says Mr. Barrington, "did not appear in him quite so early as in his brother, for he was three years old before he aimed at a tune. His first was 'God save great George our King,' and such like, mostly picked up from the street organs. He did not put a base to them till he had learnt his notes." We are told, that Mrs. Wesley "is a very sensible woman, whose testimony may safely be relied on—told Mr. Barrington that she had had "an elder son, who died in his infancy, and who both sang a tune and beat time when he was but twelve months old." Samuel from his cradle enjoyed the advantage of hearing his brother's performances on the organ, and his subsequent may undoubtedly be partly ascribed to this circumstance. He was not five years old when Handel's oratorio of 'Samson' fell into his hands, and by this alone he taught himself to read words. Soon after he learned, without instruction, to write. But before he had acquired the art of transferring his thoughts to paper, he composed, in his mind, much music. "Thus," states his father, "he set 'Ruth,' 'The Death of Abel,' &c." He was eight years old, continues the same, "when Dr. Boyce came to see us. . . . He had by this time scrawled down his oratorio of 'Ruth.' The doctor looked over it very carefully, and seemed highly pleased with the performance. His words were, 'These airs are some of the prettiest I have seen: this boy writes by nature as true a base as I can by rule and study.'"

The young musician was now introduced into all companies as a prodigy, and excited the astonishment of everybody, including the most distinguished professors. Mr. Barrington fills pages in recounting the marvellous things he not only did, but said; for that acuteness which was so striking a feature in him when a man, was not less conspicuous in his youthful days. When about eight years of age he received some instruction on the harpsichord, as well as composition, and at the same time studied the violin, to which instrument he devoted much time, and completely mastered it. In 1777 he published eight lessons for the harpsichord, and at this period had acquired so much notoriety that his portrait was engraved, and is said, by Mr. Barrington, to have been a strong resemblance.

We have understood that he began to consider music as his profession when he had arrived at his twelfth year, but have in vain endeavoured to trace his history during his progress from adolescence to manhood. Concerning his general education, we must suppose that it was attended to carefully, for he was a good Latin scholar, was not ignorant of Greek, possessed some knowledge of Italian, and had successfully cultivated that taste for polite literature which he may be said to have inherited. From personal knowledge we can state that his conversation was that of a man of letters accustomed to the best society. His steady friend, Mr. W. Linley, introduced him to Mr. Sheridan, at his villa in Surrey, where he passed two days, the party consisting only of those three. That great wit and most discerning man some time afterwards said of his guest, "I am no judge of Mr. Wesley's musical abilities, but I will venture to assert that his intellectual powers and education would have enabled him to distinguish himself in any walk of life."

Mr. Wesley's prospects were early clouded by an accident he met with in 1787. In passing along Snow-hill one evening, he fell into a deep excavation which had been prepared for the foundation of a new building. It is supposed that the severe injury he sustained was the source of that state of mind which subsequently checked the progress of a career that promised to be so brilliant. During seven years he continued in a low desponding state, refusing the solace even of his favourite art. On his recovery however he presented it with renewed ardour, and then brought into notice the works of Sebastian Bach, at that time alike unknown here and on the Continent. In 1815 he suffered a relapse, and was again obliged to retire from public life during another period of the same duration as the former. In 1823 he once more recovered, and up to 1830 was much engaged in various professional pursuits. The disease then recurred, and it was evident that his constitution was undergoing a great change. He now retired from society, and became inactive; though on the Saturday immediately preceding the day of his decease he exhibited his extemporaneous powers to a friend, and composed some psalm-tunes. On the Monday he took to his room, under a presentiment that he should never quit it, which was too truly verified. He died two days after on October the 11th, 1837.

Mr. Wesley produced many compositions, but few of them were calculated to please the multitude. He wrote a grand mass for the chapel of Pope Pius VI., for which the sovereign pontiff thanked him in a Latin letter. He then composed a 'Te Deum' for the Protestant church by composing and publishing a complete Service for the use of our cathedrals. He left a numerous family.

WESSEL, JOHN, Latinised WESSE'LUS, a Dutch divine, was born at Groningen in 1419. At an early age he lost his parents, and was educated by a charitable lady, who afterwards sent him to the college of the priests of St. Jerome at Zwoll, where he studied divinity; but he never took orders, though this has been said. He continued his studies at Cologne, where he perused with great zeal the theological works of the Abbot Rupert, the manuscript of which was in a convent at Deutz, opposite Cologne; and being an accomplished Greek and Hebrew scholar, he undertook to purify his religious knowledge by reading the original sources of the Christian religion. He was much suspected of heterodoxy, and for this reason the university of Heidelberg, where Wessel went to teach divinity, would not admit him among the professors, on the ground that he was not a doctor of divinity, and that they could not confer this dignity upon him because he was a layman. Wessel consequently left Heidelberg, and lived some years at Cologne and Louvain, where he made himself a great name by his private lectures on divinity and philosophy. His philosophical system was that of Aristotle, and his power of argumentation was so great that few doctors ventured to engage in disputes with him. Wessel made himself no less known by several treatises on religion and the state of the church, in which he attacked abuses with as much boldness as learning and shrewdness. From Louvain he went to Paris, then the theatre of violent disputes between the Realists, the Formalists, and the Nominalists. Wessel at first attacked the Formalists, but afterwards became a Formalist himself. Notwithstanding this change of principles, he maintained his name as one of the greatest dialecticians of his time, and as such the public voice recognised him by the surname of 'Magister Contradictionum,' which was probably given him in Paris. A divine possessing the learning, the talents, and the character of Wessel might have attacked the highest dignitaries in the church, at a time when the Hussites were defending their religious principles for seventeen years against the thunders of the Vatican and the armies of the Holy Roman empire; and when this war and the degenerate state of the church led to the general councils of Pisa, Constance, Sienna, and Basel. Francis della Rovere, general of the Minorites, who became afterwards pope under the name of Sextus IV., made the acquaintance of Wessel at an early period, and continued to be his friend and patron. It is said that Wessel accompanied Francis della Rovere to the council of Basel; but as this council began in 1431, and was finished in 1443, Wessel must have been very young when he went there, unless he was born in 1398, as some say, though the best authorities agree that he was born in 1419. Francis della Rovere, having been chosen pope in 1471, told his friend Wessel that he was ready to bestow any favour upon him which he should desire, and asked him if he would accept a bishop's see; but Wessel declined honours and dignities, demanding nothing but a Greek or Hebrew bible from the library of the Vatican. After a sojourn of several years at Rome, Wessel returned to Groningen, where he died on the 4th of October, 1489.

Wessel is frequently called a forerunner of Luther, and justly so, inasmuch as he tried to eradicate abuses and errors, and to restore the Christian religion to its original purity. It seems that the doctrines of Wycliffe had great influence upon him. But there is this remarkable difference between Luther and Wessel: Luther attacked the foundations of the Roman Catholic system; Wessel only wrote against particular doctrines, such as purgatory, the ban, indulgence, &c., and he took his arguments from the philosophical systems of the middle ages quite as often as from the simple truths of the gospel. He was nevertheless suspected of heresy, and after his death some monks at Groningen burnt a valuable part of his manuscripts. Wessel argued that the pope was not infallible, and that general councils alone were.

Digitized by Google

His principal productions are treatises and dissertations:—1, 'De Oratione;' 2, 'De Sacra Eucharistia;' 3, 'De Purgatorio et Indulgentiis;' 4, 'De Dignitate et Potestate Ecclesiastica;' 5, 'Propositiones de Potestate Papæ et Ecclesiæ,' &c. He wrote also numerous notes and additions to the works of the Abbot Rupert, and he used to call this voluminous production 'Mare Magnum.' The editio princeps has the title 'Farragо Rerum Theologicarum,' Leipzig, 1522, reprinted at Basel, 1523. Luther, who esteemed Wessel very highly, wrote a preface to it. This edition is not complete. The first complete edition was publish-d at Groningen, 4to, 1614; 2nd edition, Amsterdam, 4to, 1617. Some of Wessel's treatises are contained in the first volume of Goldast, 'Monarchia Sacri Romani Imperii.'

WESSELING, PETER, one of the most scholars of the 18th century, was born on the 7th of January 1692, at Steinfurt, the capital of the present principality of Bentheim Steinfurt, in Prussian Westphalia, where he received his first education. In 1712 he went to the university of Leyden, where he studied the classical languages under Perizonius, Gronovius, and Wesselius; and in 1714 he went to the university of Franeker, in West Friesland, where he finished his studies under Vitringa, Andala, and Bosius. His first intention was to study divinity, but he soon devoted himself to philology. In 1717 he was appointed corrector of the lyceum at Middleburg, with the title of professor; in 1719 he was appointed professor or professor of history and eloquence in the lyceum of Deventer; and in 1723 he became professor of history and eloquence in Franeker, which office he held during eight years. In 1735 he was appointed professor of Greek and Roman and Greek antiquities, at Utrecht; in 1738 the chair of philosophy of law, or 'jus naturæ,' as it was then, and is sometimes still called, as well as that of the public Roman and German law, was conferred upon him, and he was created doctor of law. He became director of the public library at Utrecht in 1750, or perhaps as early as 1749. Hemsterhuys invited him to teach at Leyden, but Wesseling preferred stopping at Utrecht. Wesseling was rector of the university of Franeker, in 1733, and twice, in 1736 and in 1749, he was chosen rector of the university of Utrecht. He died on the 9th of November 1764. His reputation as a scholar and a critic deservedly was great. Yet he was little disposed to critical investigations, till his friend and colleague at Franeker, Hemsterhuys, succeeded in persuading him, as Ruhnken states, that no learning, however extensive and profound, would be of any use unless it were guided by critiicism. Wyttenbach calls Hemsterhuys, Valckenaer, and Wesseling, the triumviri of philology.

The principal works of Wesseling are:—1, An edition of Diodorus Siculus, Amsterdam, 2 vols. fol., 1745-46. This edition contains the prefaces of Henry Stephens and Rhodomanus, and the Latin version of Rhodomanus, revised by Wesseling, who collected various readings from such as the notes of Camusat, and of several other scholars: De la Barre at Paris, Cocchi at Florence, and Assemani at Rome, had examined for Wesseling the manuscripts in the libraries of those three cities. The Bipont edition of Diodorus Siculus is little more than a reprint of the edition of Wesseling, though it contains the notes of Heyne and Eyring, who had access to two manuscripts at Vienna, which were not used by Wesseling. 2, An edition of Herodotus, Amsterdam, fol., 1763. Wesseling had collated the best manuscripts of England, Paris, and Vienna, and several at Rome which were in the possession of Passionei, or to which this learned cardinal had access. This edition contains the Latin version of Laurentius Valla, and the notes of Gale, Gronovius, Valckenaer, and of the editor: it was considered the best edition till that of Schweighäuser appeared in 1816. 3, 'Dissertatio Hero-loica,' 8vo, Utrecht, 1763, treats on several passages which have been erroneously attributed to Herodotus, and on several other subjects connected with Herodotus. 4, 'Veterum Romanorum Itineraria,' Amsterdam, 4to, 1735, contains the Itinerary of Antoninus, that of Jerusalem, and the 'Synecdemus' of Hierocles, which had previously been published by Bandurius, in his 'Imperium Orientale.' This is a useful edition. 5, 'Observationum Variarum Libri Duo,' Amsterdam, 8vo, 1727; 2nd ed., by Professor Frotscher, Leipzig, 8vo, 1832, contains various notes on Dion Cassius, Xiphilinus, Ammianus Marcellinus, Euripides, Sophocles, Plato, and other Greek and Roman writers. Besides several other valuable works, such as 'Liber de Judæorum Archontibus,' 'Notæ ad Samuelis Petiti Leges Aticæ,' &c., Wesseling wrote eight orations in classical Latin, among which are the following:—'Oratio de Ecclesiæ Dominationis,' Franeker, fol., 1724; 'Oratio in Obitum celissimæ et regiæ Principis Annæ, Fœderat. Belgic. Gubernatricis,' Utrecht, fol., 1759; and nineteen 'Dissertationes,' among which are 'Dissertatio Historico-critica de S. Pauli ad insulam Melitam Naufragio;' 'De Origine et Progressu Religionis Christianæ in Veteri Persarum Regno;' and 'Epistola ad H. S. Reimarum, qua selecta quædam Dionis Cassii loca partim emendantur, partim illustrantur.' A complete list of the works and other productions of Wesseling is contained in 'Elogium Wesselingii,' in Frotscher's edition of Wesseling's 'Observationum Variarum Libri Duo.' Wyttenbach, 'Vita Davidis Ruhnkenii,' p. 46; David Ruhnken, 'Elogium Tiberii Hemsterhusii,' 2nd ed., 1789, p. 60, &c. Strodtmann, 'Das Neue Gelehrte Europa,' parts iv., ix., xx.: Wesseling's 'Preface' to his edition of Herodotus.

WEST, BENJAMIN, president of the Royal Academy, and a distinguished historical painter, was born on the 10th of October 1738, at Springfield in Pennsylvania, in the United States of North America: he was the tenth child of John and Sarah West. John West was born and educated in England, and was of the Quaker family of the Wests of Long Crendon in Buckinghamshire, of whom was Colonel James West, the friend of John Hampden. Benjamin's birth was brought on prematurely by a vehement sermon preached in the fields near his mother's residence by Edward Peckover; the subject was the corrupt state of the old world and its imminent destruction. Mrs. West was herself home ill, and Benjamin was born after an illness of twelve days. The peculiar circumstances of his birth gave rise to various surmises and prophecies regarding the child's future destiny, and those which promised his future greatness were credulously cherished by his family. The first indication that the genius of his father was in his seventh year, when set to watch the sleeping infant of his eldest sister. He drew a sort of likeness of the child in red and black ink, a fact which appeared so wonderful in the eyes of his parents, that they recalled to mind the predictions of Peckover. When he was about eight years old, a party of Indians paid a visit to Springfield, and struck with the drawings young West had made of birds, fruits, and the like, they taught him to prepare the red and yellow colours with which they stained their weapons; and these, together with the indigo given him by his mother, with the aid of some hair-pencils supplied from his mother's favourite's cat's back, enabled him to make more satisfactory efforts than his pen-and-ink sketches had been. A merchant of the name of Pennington and a cousin of the Wests saw some of these attempts, and upon his return home he sent his young friend a box of colours with pencils, canvas, and six prints. Young West from this time forsook school and almost shut himself up with his presents in a garret, which he converted into his studio. He made a picture from two of these prints, and Galt, West's biographer, saw this early attempt in the same room with the great painting of Christ rejected; and he relates that West told him that there were touches in that first essay which he had never surpassed.

In his ninth year West accompanied his friend Mr. Pennington to Philadelphia, and that gentleman introduced him to a painter of the name of Williams, who was delighted with the boy's efforts, gave him two books to read, Du Fresnoy's and Richardson's, and invited him to come and see his pictures whenever he pleased. From this time West was determined to become a painter, and his parents were pleased with his resolution. West's first patron was Mr. Wayne, who gave him a dollar each for pictures upon which he had drawn some figures; and he was at the same time assisted by Dr. Morris, who gave him some money to purchase prepared panels with. His first painting which attracted much notice was the portrait of Mrs. Rose, of Lancaster, a neighbouring town. This led to many other portraits, and the commands of the same gentleman led him to paint a picture of the death of Socrates. West said he could paint faces and men clothed, but he asked what he was to do with the slave who presented the poison, who, he thought, should be naked. The gunsmith answered the difficulty by going to his shop and returning with one of his workmen, who was half naked, and offering him as a model. The picture was painted, and attracted much attention.

Upon his return to Springfield, when he was about sixteen years of age, the propriety of his following professionally such a vain and unprofitable calling as painter was canvassed by his Quaker friends; but after they had satisfied themselves of the distinction between the use and the abuse of the art, they agreed unanimously that in his case they might suspend the strict operation of their tenets: and his becoming a painter by profession was sanctioned by the whole Quaker community of Springfield. Shortly after this event, West served as a volunteer under Major Sir Peter Halket, and went in search of the remains of the army which had been lost under General Braddock. But from this service he was soon called home by the illness of his mother, and he arrived just in time to see her die. After this event, which he appears to have greatly felt, he left his home, and established himself, then only in his eighteenth year, as a portrait-painter at Philadelphia. He charged two guineas and a half for a head, and five for a half-length. He painted at this time his friends and his Trial of Susannah. From Philadelphia he went to New York, and doubled his prices. Here he had an opportunity of going to Rome, a journey he had long desired to make. He arrived at Rome in July 1760, and was well received. When he was introduced, by Lord Grantham, to the old Cardinal Albani, who was blind, as a young American who had come to Rome to study the arts, the Cardinal asked whether he was black or white.

West however soon attracted other attention than that of mere curiosity. He painted a portrait of Lord Grantham, which was placed in the gallery of Cresgnigni, where artists and amateurs used to meet. The picture was almost universally supposed to be by Mengs, and all were greatly surprised when they heard that it was painted by the young American. Mengs himself is said to have told West that he had no occasion to come to Rome to learn to paint; and he advised him immediately to visit the principal cities of Italy, and examine the various great works in them, and then to return to Rome and paint some historical picture. An illness prevented West from putting this plan into execution; he was confined through a fever eleven months at Leghorn. When he recovered, instead of being without means, he found to his great astonishment that his agent had orders to give him

Digitized by Google

unlimited credit. He owed this to the generosity of two Philadelphia merchants, Mr. Allen and Governor Hamilton. He now parented the plan recommended by Menge; and after he had examined all that was worth studying in Florence, Bologna, Venice, and Parma, he returned to Rome, and painted two pictures, which were well received; one of Cimon and Iphigenia, and one of Angelica and Medora. He was elected a member by the academies of Florence, Bologna, and Parma.

In 1763 West visited England on his way back to his own country; and in London he had the good fortune to meet three of his best friends, Messrs. Allen, Hamilton, and Dr. Smith, who had always taken great interest in him. He soon made connections by the help of his many friends, and the two pictures mentioned above, and a portrait of General Monckton, second in command to Wolfe at Quebec, all of which he exhibited in town, procured him a few commissions. He painted the parting of 'Hector and Andromache' for Dr. Newton, and the 'Return of the Prodigal Son' for the bishop of Worcester. Lord Rockingham offered him 700*l.* per annum to decorate his mansion in Yorkshire; but this offer, by the advice of his friends, he declined. His success was such as to induce him to remain in this country, and having been long attached to Elizabeth Shewell, a young American lady, he requested her to come over to him to England, which she did, and they were married in 1765, at St. Martin's-in-the-Fields.

West's good fortune seemed to keep pace with his years. Dr. Drummond, the archbishop of York, commissioned him to paint a picture of Agrippina landing with the ashes of Germanicus; and that the prelate was as well pleased with the performance, that he attempted to procure the painter an annuity by subscription, so as to enable him to desist from painting portraits and to confine himself to historical subjects. He proposed to raise 300*l.* a-year, and his friends subscribing 150*l.*; he however failed in the enterprise, but he praised highly the painter and the picture so highly to George III., that the king desired he would send the young painter with his picture to him. West was well received by the king, who presented him to the queen, and commissioned him to paint a picture for him of the Departure of Regulus from Rome. This was the commencement of nearly forty years' intimacy with George III. West's excellence as a painter however was not the only source of his good fortune; he was an excellent skater, and acquired many acquaintances of rank through this accomplishment. When the Serpentine river in Hyde Park was frozen over, a great circle of spectators was frequently seen to admire the young American painter cutting the Philadelphia salute.

The picture of Regulus was exhibited in the first exhibition of the Royal Academy, of which West was one of the principal members; he had previously been a member and director of the Society of Artists, incorporated in 1765. But his 'Death of General Wolfe' was the first work which caused much stir among artists. Instead of representing his actors in Greek and Roman costumes, as was usual, he very sensibly painted them in their own dresses: a innovation which Sir Joshua Reynolds had tried to dissuade him from. When the picture was finished, according to Galt, "Reynolds seated himself before the picture, examined it with deep and minute attention for half an hour; then rising, said to Drummond, 'West has conquered —he has treated his subject as it ought to be treated, and I withdraw my objections. I foresee that this picture will not only become one of the most popular, but will occasion a revolution in art.'" West was now thoroughly established both in the king's favour and in that of the public, and he continued to paint in rapid succession a series of large historical pictures, and there can be no question that the great reputation he acquired was relatively well merited. Lord Grosvenor purchased the picture of the 'Death of Wolfe,' and West made a copy of it for the king. He painted also for the king, the 'Death of Epaminondas' as a companion to it; the 'Death of the Chevalier Bayard;' 'Cyrus liberating the Family of the King of Armenia;' and 'Segestus and his Daughter brought before Germanicus.' He painted the following series of large historical works for George III. at Windsor:—Edward III. embracing the Black Prince, after the battle of Cressy; the Installation of the Knights of the Garter; the Black Prince receiving the King of France and his Son prisoners at Poictiers; St. George killing the Dragon; Queen Philippa defeating David of Scotland in the battle of Neville's Cross; Philippa interceding with Edward for the Burgesses of Calais; Edward forcing the passage of the Somme; and Edward crowning Sir Eustace de Ribaumont at Calais.

After the completion of these works, West proposed to the king to paint a great series upon the Progress of Revealed Religion; but his majesty, before consenting to this proposal, consulted some of the dignitaries of the Church as to the propriety of introducing paintings into a place of worship: Bishop Hurd answered for himself and colleagues, and said that the introduction of religious paintings into his majesty's chapel could in no respect violate the laws or usages of the Church of England. Out of thirty-five subjects proposed by West, all were approved of by the bishops: he afterwards added another to the number. He divided the series into four dispensations,—the Antediluvian, the Patriarchal, the Mosaic, and the Prophetic. Half of the subjects were from the Old Testament and half from the New. They were all sketched, and twenty-eight of them were executed, for which West received 21,705*l.* He painted also in the meantime nine pictures of portraits of the royal family, for which he received 2000 guineas.

After the death of Reynolds, in 1792, West was unanimously elected president of the Royal Academy, and the king sent the Duke of Gloucester to him to inquire whether the honour of knighthood would be acceptable to him, but West declined it; stating however at the same time that with his "hereditary descent and the station I occupy among artists, a more permanent title might become a desirable object" were he possessed of fortune, independent of his profession, sufficient to enable his posterity to maintain the rank. In 1801, during the illness of George III., West met with perhaps the first reverse in his life: Mr. Wyatt, the royal architect, called upon him, and told him that the pictures painting for the chapel at Windsor must be suspended until further orders. Deeply affected he wrote a letter to the king, which was carried to the court by Wyatt, but he received no answer to it. When the king recovered, West sought and obtained a private audience, and he found that the king did not know of the order to suspend the paintings, and that he had not received any letter from him. He spoke very kindly to West, and said, "Go on with your work, West; go on with the pictures; and I shall take care of you." This was West's last interview with his early, constant, and truly royal patron. "But he continued," says Galt, "to execute the pictures, and in the usual quarterly payments received his 1000*l.* per annum till his majesty's final superannuation; when, without any intimation whatever, on calling to receive it, he was told it had been stopped, and that the paintings for the chapel, of Revealed Religion, had been suspended. It remained in silence—he neither remonstrated nor complained." During the thirty-three years which West worked for George III., he received 34,187*l.* from the king. This sum was held up to the public by West's enemies, without any statement of how it had been earned; and although it is a large sum in itself, yet when West's professional position and abilities, and his years of toil for it, are considered, it makes but a poor income, and much less than would satisfy any successful portrait-painter of that or the present day. After the peace of Amiens West visited Paris, where he was remarkably well received, to see the great collections of works of art which Bonaparte had assembled in the Louvre. After his return he retired from the president's chair in the Academy owing to a strong opposition among its members. Wyatt, the architect, was put in his place, but in the following year, 1803, he was, with one exception, unanimously re-elected to the chair. The dissenting voice was supposed to be that of Fuseli, who voted for Mrs. Lloyd, an academician, and when he was taxed by some of the members with having given this vote, says Mr. Knowles, his biographer, he answered, "Well, suppose I did; she is eligible to the office—and is not one old woman as good as another?"

When West lost the patronage of the court, although sixty-four years old, he commenced a series of great religious works on a larger scale than any of those for George III. The first of this series was, Christ Healing the Sick, which was purchased by the British Institution for 3000*l.* and presented to the National Gallery. The picture was painted as a present for an hospital established by the Quakers at Philadelphia; but when it was sold, West sent them a copy of it with some alterations in its stead. The copy was exhibited at Philadelphia, and the profits of the exhibition enabled the committee of the hospital to enlarge the building.

The success of this piece induced West to continue even with greater works. He painted a Crucifixion, sixteen feet by twenty-eight; the Ascension, and Inspiration of the Apostles; and a Descent of the Holy Ghost on Christ at the Jordan, all of very large dimensions. In 1814 he exhibited a picture of Christ rejected by the Jewish High-Priest, and in 1817 he exhibited his extraordinary picture of Death on the Pale Horse, from the Revelations. Others of his large works are the Brazen Serpent, in the possession of Mr. Nesbit, and St. Paul on the island of Melita, now the altar-piece at Greenwich Hospital. Besides these works, he painted several others of a different kind, which were very popular: of these the Battle of La Hogue is one of the best; there is an excellent engraving of it by Woollet; the same artist engraved his picture of the Death of Wolfe. John Hall also engraved three beautiful plates of Penn treating with the Indians, the Battle of the Boyne, and Cromwell dismissing the Long Parliament. The Battle of the Hogue and the Death of Wolfe are accounted Woollet's masterpieces. The Departure of Regulus, and its companion, Hannibal swearing enmity to the Romans, have been scraped in mezzotinto by Valentine Green.

In 1817 West lost his wife, and he survived her little more than two years; he died at his house in Newman Street, March 11, 1820, and was buried with great pomp in St. Paul's cathedral. Two sons survived him.

West's works are numerous: he painted or sketched about four hundred pictures, many of which are the largest works that have been executed in this country, and he left about two hundred drawings. He drew well, and many of his works are well conceived and composed; but in colouring he was far from successful, his pictures are too often of a uniform reddish-brown tint; and in expression he was decidedly deficient in character, and monotonous both in feature and countenance. His great works taken from Classical and Biblical history show considerable academical talent, but not a spark of genius. His best works are his 'Death of General Wolfe,' the 'Battle of La Hogue,' and one or two more of that class. When West was elected

Digitized by Google

president of the Royal Academy, he imitated the example of Sir Joshua Reynolds, and read discourses to the students at the distributions of prizes. As literary compositions those discourses are far from remarkable, and they are chiefly distinguished for their simplicity and common sense. The British Institution arose out of a favourite plan of West's, which failed, to establish a national association for the encouragement of works of high art. There is a full-length portrait of West, by Sir Thomas Lawrence, in the National Gallery.

WEST, GILBERT, was the son of the Reverend Dr. West, by whom an edition of Pindar was published at Oxford in 1697, and who died in 1716: his mother was Mary, the eldest of the three sisters of Sir Richard Temple, afterwards Lord Cobham; the second of whom, marrying Mr. Richard Grenville, succeeded her brother as Viscountess Cobham, and was afterwards created Countess Temple; and the third of whom married Sir Thomas Lyttelton, father of the first Lord Lyttleton. West is supposed to have been born about 1705. It was intended by his father that he should go into the Church; and with that view he was first sent to Eton and afterwards to Oxford; but, obtaining a commission through the interest of his uncle, Lord Cobham, he was induced to make the army his profession. It is supposed however that his tastes did not well accord with a military life, and he after some time resigned his commission and "engaged," says Dr. Johnson, "in business under the Lord Townshend, then secretary of state, with whom he attended the King to Hanover. This must have been in 1721, when Townshend, in his second secretaryship, went to Hanover with George I., and the struggle for pre-eminence commenced between him and his colleague Carteret, which ended, three years after, in the removal of the latter. West probably continued to act as secretary or in some such capacity, to Townshend till the resignation of that minister, in May 1730. Johnson states that in May 1729, his patron rewarded him with a nomination to be clerk extraordinary to the privy council, which however produced him no immediate profit. But he seems to have had some resources, for we are told that soon after this he married and settled in a very pleasant house at Wickham, in Kent, "where he devoted himself to learning and to piety," and where he was often visited by his relations, the first Lord Lyttelton and the elder Pitt. It is said that the education of the young Prince George of Wales (afterwards George III.) was once offered to him, "but that he required a more extensive power of superintendence than it was thought proper to allow him." It was not till 1752 that he reaped the benefit of Townshend's nomination, by succeeding to one of the clerkships of the privy council, which, soon after his friend Pitt, now in office, made him treasurer of Chelsea Hospital. But he did not long enjoy this increase of income; in 1755 he lost his only son; and on the 26th of March 1756, he was himself carried off by a stroke of palsy.

Gilbert West is the author of several poetical productions, of which his versions of some of the Odes of Pindar, first published in 4to, in 1749, are the best known, or rather attracted most notice in his own day, for the work is now nearly forgotten. It has little merit, except some elegance or smoothness of versification. The publication is entitled 'Odes of Pindar, with several other Pieces in prose and verse, translated from the Greek;' the two most important of the other translations are one of the 'Iphigenia in Tauris,' from Euripides, and one of Plato's 'Menexenus.' There is also an elaborate 'Dissertation on the Olympick Games.' West's literary reputation principally rests on his 'Observations on the Resurrection,' first published in 1730, and since often reprinted. This tract, for which the University of Oxford, in March 1748, made the author a Doctor of Laws by diploma, used to rank as one of the ablest examinations in English theological literature of a particular point. In the evidences of Christianity, forming a companion to Lord Lyttelton's 'Dissertation on the Conversion of St. Paul,' which is addressed to West, and was written in consequence of the convictions which West's conversation was the means of suggesting or improving. Both West and Lyttelton had at one time adopted infidel principles, and "when West's book was published," Dr. Johnson tells us, "it was bought by some who did not know his change of opinion, in expectation of new objections against Christianity."

WESTALL, RICHARD, R.A., was born at Hertford in 1765. In 1779 he was apprenticed to Mr. Thompson, an engraver, in the city, of heraldry on silver, but his superior abilities having been perceived by Mr. Alefounder, a miniature painter, he was recommended by that gentleman to study drawing, and make painting his profession. He accordingly obtained leave from his master in the last year of his apprenticeship to draw in the evenings at the Royal Academy, and in 1786 he was at liberty to follow the bent of his own inclination. He took, jointly with his friend Sir Thomas (then Mr.) Lawrence, a house in Soho-square, in the corner of Greek-street, which they held together for some time.

Westall's first performances which attracted the notice of the public were some highly finished historical pieces in water-colours, in which he was without a rival: of these the following were particularly admired:—Sappho in the Lesbian Shades, chanting the Hymn of Love; Jubal, the first voice of the Lyre; the Boar that killed Adonis brought to Venus; the Storm in Harvest; the Marriage Procession (from the Shield of Achilles); besides many others. He made also a series of graceful designs to illustrate Milton, for Alderman Boydell; and he was a contributor to the 'Boydell Shakspeare.' He painted at the same time several large historical pictures, but he met with so little success in the disposal of them, that he was almost compelled to confine himself to making small designs for booksellers, and in the number and popularity of his designs of this class he was second only to Stothard. They added however little to his reputation, for, owing probably to the great number required of him, he fell into a peculiar and decided mannerism. Among many other works, he illustrated Crabbe's 'Poems,' and Moore's 'Loves of the Angels.' Westall was elected an associate of the Royal Academy in 1794, the same year in which Sir Thomas Lawrence and Stothard were elected. In 1808 he published a book of poems illustrated by himself. Towards the close of his life he became very much embarrassed in his means, owing to some unsuccessful speculations in foreign pictures and some imprudent pecuniary engagements. His last occupations were giving lessons in drawing and painting to her present majesty while Princess Victoria. He died on the 4th of December 1836.

WESTALL, WILLIAM, A.R.A., younger brother of the above, was born at Hertford, October 12, 1781. He studied at first under his brother, and subsequently at the Royal Academy. Here however his studies were interrupted, by his appointment, in 1801, on the recommendation of the President, West, to accompany Captain Flinders in the Investigator as a draftsman on his voyage of discovery. Westall was with Flinders for two years, when, the Investigator having been abandoned, he was transferred to the companion ship, the Porpoise, in which he was wrecked on a coral reef on the north coast of Australia on his voyage home. The ship which picked up Westall and his companions was bound to China, and he remained some months in that country, when he secured a passage to India. Here he also remained some time, making a journey into the interior and occupying himself, as elsewhere, in sketching the more striking scenery and objects. Not finding, on his return to England, employment as readily as he anticipated, he made a voyage to Madeira and the West India Islands; and on his return opened, in 1808, an exhibition of the large collection of water-colour drawings and sketches he had made of the various countries he had visited: it proved however an unsuccessful speculation. Captain Flinders returned to England in 1810, and Westall was directed by the government to prepare his sketches for engraving to illustrate the account of the voyage: he was also commissioned to paint several views of the coasts and interior of Australia. Of these he exhibited at the Royal Academy, in 1812, his views of 'Port Bowen, and 'Seaforth's Isle in the Gulf of Carpentaria;' and the striking character of the scenery, and the wonderful herbage, which he has depicted with the fidelity of a botanist, rendered them very attractive. They secured his election as Associate of the Royal Academy in the same year: he had for some time previously been a member of the Society of Painters in Water Colours. Unfortunately perhaps for his fame, Westall does not steadily follow up the path he had thus struck out. He turned his attention to making drawings for engraving, in which he for many years found ample and profitable employment, but he thus contracted a neatness and prettiness of style which proved destructive to all grandeur of effect when applied in his paintings. Among his best known series of engraved designs are his views of the lakes of Westmoreland and Cumberland, which are drawn with great fidelity, though with some deficiency of power: he was a frequent visitor to this district, where he enjoyed the warm friendship of Southey and Wordsworth, by both of whom he was greatly esteemed. He also drew and engraved in aquatint a series of views of the Caves, and of the Abbeys and other Monastic Ruins of Yorkshire, of the Isle of Wight, Oxford, Cambridge, the Residences of the Poets, &c. His contributions of oil paintings to the exhibitions of the Royal Academy were comparatively few, and in the later years they became fewer than they might else have been, from finding himself in reality excluded from the full honours of that institution. Mr. Westall met with a severe accident, in 1847, by which his left arm was broken, and he received some internal injuries, and from the effects of which he never wholly recovered. He died January 22, 1850.

WESTMACOTT, SIR RICHARD, R.A., was born in London in 1775. His father was a sculptor of some eminence in his day, and in his studio (Mount-street, Grosvenor-square,) the young Westmacott learned the use of the chisel. In 1793 he went to Rome, where he had the benefit of instruction from Canova. His career as a student in Italy was a distinguished one. He carried off the first prize in sculpture at the Academy of Florence, in 1794; and in 1795 the medal given by the pope. He was elected a member of the Academy of Florence in 1795. After a somewhat prolonged stay in Italy, he returned to London, and was soon recognised as one of the best of the young sculptors of the day; and his future career was on the whole a very prosperous one. His imaginative works were of an exceedingly graceful, chaste, and poetic character, classic in feeling, and in execution resembling that of the modern Italian school; several of these will retain their place among the best poetic works of the English school of sculpture. The most popular is his very pleasing statue of 'Psyche,' executed for the Duke of Bedford, and now, with a companion 'Cupid,' at Woburn. Among the best known of his other poetic works are the 'Euphrosyne,' executed for the Duke of Newcastle; an exquisite figure of 'A Nymph unclasping her Zone,' the property of the Earl of Carlisle; 'The Distressed Mother,' executed for the Marquis of Lansdowne; 'The Homeless Wanderer;' 'Devo-

Digitized by Google

tion,' &c. He also executed several important works in alto and bas-relief; one of the first of which was probably his portion of the frieze on the Marble Arch (now at Cumberland Gate), the sculptors of other portions being Flaxman and Baily. His latest work in this style was the pediment of the British Museum. He also executed for the late Earl of Egremont a large altar-piece in marble of the 'Death of Horace' for the gallery at Petworth. A large portion of his time was however occupied, and much of his reputation now rests, on public monumental statues. Of these it will suffice to mention his statues of Pitt, Fox, Spencer Perceval, and Addison (1809), which, with his monuments of the Duc de Montpensier, and Mrs. Warren and her Child, are in Westminster Abbey; Sir Ralph Abercromby, Lord Collingwood, and Generals Pakenham and Gibbs, in St. Paul's Cathedral; Lord Erskine in the Old Hall of Lincoln's Inn; Fox in Bloomsbury-square; Francis, Duke of Bedford, in Russell-square; and the Duke of York on the column at Waterloo-place. The so-called 'Achilles,' copied from the statue at Monte Cavallo, Rome, and inscribed by the Women of England to the Duke of Wellington, was modelled by Westmacott, but whether the choice of the figure is to be laid to the charge of his taste, or that of the women of England, we do not know.

Westmacott was elected A.R.A. in 1805, and R.A. in 1816. In 1827 he succeeded Flaxman as Professor of Sculpture at the Royal Academy, which office he held till his death. He was a man of extensive reading and sound judgment, and his lectures were marked by these qualities, and by the absence of pretension. Shortly after her accession to the throne, her Majesty conferred on him the honour of knighthood. He died on the 1st of September 1856.

* WESTMACOTT, RICHARD, the son of the preceding, was born in London in 1799. He studied under his father, and in 1820 proceeded to Italy, where he remained six years diligently occupied in studying the remains of Greek and Roman art, and investigating their history. The works of Mr. Westmacott are in many respects not unlike those of his father; graceful and tender in conception, with something of classic severity in the style, and never failing purity of feeling,—but his genius is of a graver character, and he excels in monumental and devotional subjects, and in fancies of a thoughtful and reflective cast. He is especially happy in the treatment of infants. Among his classical and academic works may be noticed his rilievi of 'Venus and Ascanius,' and 'Venus instructing Cupid,' executed for the Earl of Ellesmere; a seated statue of the 'Cymbal Player,' the property of the Duke of Devonshire; 'Venus carrying Cupid;' the statue of 'Ariel;' 'Paolo and Francesca,' an admirable bas-relief executed for the Marquis of Lansdowne. More original in style are his charming fantasies the 'Bluebell' and the 'Butterfly,' two exquisite bas-reliefs executed for the Earl of Ellesmere (1836-38). As examples of his monumental works, we may instance his recumbent figure of the Archbishop of Canterbury, in Canterbury Cathedral, and that of Earl Hardwicke at Wimpole; and the Ashburton monument, and especially the grand figure of the 'Angel Watching.' Of his religious works we may mention the fine statue of 'David as the Slayer of Goliath;' 'Prayer and Religion;' and the bas-relief of 'Suffer me to Sin no More.' Of late years Mr. Westmacott has been chiefly occupied in the execution of monumental and portrait sculpture. His busts are very numerous, and include those of Lord John Russell, Sir Francis Burdett, Sydney Smith, Sir R. Murchison, and other celebrated personages: but he is perhaps most successful in female busts. The pediment of the Royal Exchange is from his chisel. Mr. Westmacott is also distinguished for his literary attainments. He has contributed several valuable papers to various serial publications, among others, the articles 'Sculpture' to the 'Penny Cyclopædia,' and to the 'Encyclopædia Metropolitana;' and he has delivered course of lectures on the history and principles of Sculpture at the Royal and London Institutions. He was elected F.R.S. in 1837; A.R.A. in 1838; R.A. in 1849; and to succeed his father as Professor of Sculpture in July 1857.

WESTMORLAND, MILDRAY FANE, SECOND EARL OF, was born about the year 1600. He was one of the Knights of the Bath at the coronation of Charles I., and at the breaking out of the civil war he ranged himself under the Royal banner; but in 1643 (according to Whitelocke's 'Memorials') he "came into parliament, along with divers other delinquents, desiring the benefit of the act of pardon for both kingdoms for composition:" he subsequently took the parliamentary oath. Concurring however in the restoration of the monarchy, he was taken into the favour of Charles II., and appointed joint lieutenant of Northamptonshire. His name is best known as the author of a scarce volume of poems of more than ordinary merit, printed only for private circulation in 1648, and entitled 'Otia Sacra.' He died in 1665. The family of Fane, we should add, is descended from a common ancestor with the Vanes of Cleveland, namely, Howell ap Vane, who held landed property in Monmouthshire before the Norman Conquest.

* WESTMORLAND, JOHN FANE, ELEVENTH EARL OF, and a general in the army, is the eldest and only surviving son of the tenth earl by his first wife, the daughter and heiress of Robert Child, Esq., banker, of Osterley Park, Middlesex. He was born in 1784, and was educated at Westminster School. Entering the army in 1803, he served as aide-de-camp to the late Sir A. Don in the expedition to Hanover of 1805-6. He subsequently served in Sicily, the Dardanelles, Egypt, and the Peninsula, where he was aide-de-camp to the Duke of Wellington. Having served through a great part of the campaigns of Spain and Portugal, he accompanied the Allied Armies in Germany as military commissioner in 1813, and in the following year became envoy at the court of Florence. In 1815, whilst still bearing the courtesy title of Lord Burghersh, he accompanied the Austrian army in the campaign which ended in the restoration of the Bourbons to the throne of the Two Sicilies; he was also for some years British minister at the court of Tuscany. In 1841 he succeeded to his father's title, and was appointed ambassador at the court of Berlin, and held that post for ten years. In 1851 he was sent to succeed the late Lord Ponsonby as ambassador at Vienna, and in that capacity acted on the part of the British government in the discussion of the complicated Eastern question, out of which the Russian war arose. He retained this position down to the year 1855, when Lord John Russell was sent to Vienna on a special mission to co-operate with him in the Vienna Congress. In December 1855 he returned home, being replaced in his diplomatic post by Sir G. Hamilton Seymour. Besides being a soldier and a diplomatist, Lord Westmorland bears the reputation of being a distinguished musician, and has of late years taken the greatest interest in the Concerts of Ancient Music. He has received at various times the foreign orders of Maria Theresa, San Ferdinand, San Josef of Austria, and of Henry the Lion of Brunswick; he is also a Knight Grand Cross of the Bath in England, a member of her Majesty's Privy Council, and colonel of the 59th regiment of Foot. He married in 1811 a daughter of Lord Maryborough, afterwards third Earl of Mornington, by whom he has two daughters and two surviving sons, the elder of whom, Lord Burghersh, was aide-de-camp to the late Lord Raglan in the Crimea, and is now captain in the Coldstream Guards and a Companion of the Bath.

WETSTEIN, JOHN JAMES, distinguished for his labours on the text of the Greek New Testament, was descended from a family which had long been one of distinction in the city of Basel. His grandfather, John Rudolph Wetstein, who was born in 1614 and died in 1684, was professor of Greek, and afterwards of divinity, in the university there, as was also one of his sons of the same names, who was born in 1647 and died in 1711. Another son, Henry, was the well-known learned printer of Amsterdam, and died in 1712. Rudolph, a son of the second John Rudolph, was professor of divinity at Basel; and John Henry, another son, became a bookseller at Amsterdam.

The subject of the present notice was born at Basel in 1693. After having studied divinity under his uncle the professor, and Hebrew under Buxtorf, he was admitted a minister of the national church in 1713, on which occasion he printed a Latin thesis in defence of the substantial genuineness and authenticity of the commonly received text of the Greek Scriptures, under the title of 'Dissertatio de Variis Novi Testamenti Lectionibus.' To this subject he was to be said to have thenceforth devoted his life. He commenced by visiting France and England, as well as the various libraries in Holland, for the examination of manuscripts; he was in England in 1716, and again in 1720, and he appears to have been employed for some years in this work by Bentley, who had himself printed a new edition of the Greek Testament (see Life, by Monk, pp. 311 and 429). It was not till 1730 that Wetstein produced his next publication, a quarto volume of 'Prolegomena' to a proposed new edition of the Greek text according to the most ancient codices. By this time however his critical investigations had alarmed a party among his clerical brethren, who had influence enough not only to obtain a decree from the senate of Basel condemning his project as both unnecessary and dangerous, but even to get him prohibited from officiating as a minister. On this he retired to Amsterdam, where the Remonstrants or Arminians appointed him successor to Le Clerc in the professorship of philosophy and history; and although, on his making a public apology for some opinions savouring of Socinianism that had been ascribed to him, the decree of the Basel senate was reversed in May 1733, he resided at Amsterdam for the rest of his life, and died there on the 24th of March 1754. He had meanwhile paid another visit to England in 1716. His edition of the Greek New Testament appeared at last, at Amsterdam, in 2 vols. folio, in 1751 and 1752. Notwithstanding many errors by which it is disfigured, this edition (now become very scarce) is one of great value for the various critical matter it contains. The first volume of an intended reprint of it, in 4to, corrected and improved, appeared at Rotterdam in 1831, under the care of the learned J. A. Lotze; but his death prevented its being continued. The portion published contained only the Prolegomena. There is also a previous republication of the Prolegomena at Halle, in 1764, under the care of Dr. John Solomon Semler. Two epistles attributed to Clemens Romanus, which Wetstein had printed at the end of his New Testament, from a Syriac manuscript, have been proved by Lardner to be spurious.

* WEYER, SYLVAIN VAN DE, a distinguished Belgian writer and statesman, well known in English society, was born at Louvain in 1803, the son of a commissary of police. He studied at the university of his native town, and afterwards became a member of the Brussels bar, but at an early age was named librarian of the city of Brussels, and devoted himself chiefly to literary pursuits. In 1825 he published at Louvain an edition of the philosophical works of Francis Hemsterhuys, the son of Tiberius Hemsterhuys, the eminent classical scholar, both

Digitized by Google

of them Dutchmen by birth, but of whom the father wrote exclusively in Latin and the son in French. Van do Weyer, in a 'Letter to M. Munch on the National Language,' showed a fondness for the French language and a contempt of his native Flemish, which drew on him the indignant remonstrances of his countryman Willems. "I have the honour," said Willems, in a printed letter addressed to him in 1829, "to know you and to know something of the language that has always been spoken in your family and mine. When you protest aloud before the public that a man like M. Van de Weyer would think himself dishonoured if he had written in favour of that language, I think I have some right to place myself among the public as one of your judges." The question of language was one of the many that embittered the disputes then pending between the Belgian people and its governors. Van de Weyer became a writer in the leading newspaper called the 'Courier des Pays Bas,' the principal organ of the popular party, and when M. de Potter was prosecuted by the government for sedition, he made his first conspicuous appearance as an advocate as one of the counsel on his trial. A verdict was pronounced against De Potter, and Van de Weyer was dismissed from his post as librarian, but the Paris revolution of 1830, and the Belgian revolution in consequence, followed so immediately, that he had no time to regret the loss. He was one of the members of the Committee of Safety appointed to re-establish order in Brussels after the retirement of the Dutch authorities, and also a member of the provisional government named on the 24th of September. At the beginning of November he was charged with an important mission to the English government, his brilliant success in which led him during the whole time of his life to a diplomatic career. He procured the assent and support of the British government to a proposition for consolidating the changes which had taken place in Belgium by a conference of the great powers, to be held in London. To this conference Van de Weyer was accredited, and achieved further diplomatic success. Under the sovereignty of Suriet de Chokier he was nominated to the ministry of foreign affairs in Belgium, and in this position proposed the name of Prince Leopold as a candidate for the Belgian throne, and materially contributed to promoting his election. He was sent by King Leopold as his ambassador to the court of London, and in 1839 married Miss Bates, the daughter of an American partner in the great commercial house of Baring. In 1845, on the fall of the Nothomb cabinet, he was recalled to Brussels as premier; but in his endeavours to reconcile the conflicting views of the Catholics and Protestants on the education question he did not meet with his wonted success, and he returned the next year to his London embassy, in which (1857) he still continues. M. Van de Weyer is in great favour with the highest London society; his name stands high as an authority in literature and the arts, and he has frequently given valuable legal evidence before royal commissions and committees of the House of Commons on questions in which they were concerned. His political career put an end to his appearance as a writer, except that he wrote his two pamphlets on the Belgian question under the assumed names of Victor de la Marre and Goubeau de Rospeet. He has lately shown an inclination to resume his literary occupations. He is one of the members of the recently-established Philobiblion Society of London, which circulates an occasional volume of 'Bibliographical and Historical Miscellanies,' in an edition of a hundred copies only, and has announced what promises to be an interesting series of articles 'On the English Authors who have written in the French Language.'

WEYERMAN, JACOB KAMPO, a Dutch fruit and flower painter, was born at Breda in 1679. Weyerman, though a clever painter, is chiefly notorious for his bad character and scandalous writings. He wrote a set of lives of Dutch painters, which, according to Van Gool, are full of calumnies; and Descamps says of him, "Il a rempli ses écrits d'ordures, d'impiétés, et de calomnies." His work is entitled 'Levensbeschryvingen der Nederlantsche Konstschilders en Schilderessen,' 4to, 's Gravenhage, 1729. In one of his scandalous writings he attacked the Dutch East India Company; and in 1739 he was condemned to perpetual imprisonment at his own cost, in which he died in 1747. Weyerman learnt painting of Ferdinand van Kessel, and had great skill in his style and great facility in writing; he however neglected his art and abused his abilities, and, according to all accounts, appears to have been a thoroughly bad man in every respect.

WHARTON, REV. HENRY, was born on the 9th of November 1664, at Worstead in Norfolk, of which his father, the Rev. Edmund Wharton, the descendant of an ancient family, and afterwards rector of Saxlingham in the same county, was then vicar. After being taught Latin and Greek by his father, he was admitted of Caius College, Cambridge, February 17th, 1680, and at Michaelmas in the same year was chosen to one of the scholarships founded by Mr. Matthew Stockye, who was his great-uncle. Having taken his degree of B.A. in 1684, he resided in his college till 1686, when he was taken into the employment of Dr. William Cave, then engaged in the compilation of his 'Scriptorum Ecclesiasticorum Historia Literaria,' in which Wharton assisted him not only as an amanuensis, but to so great an extent, in at least the collection of materials, that a dispute afterwards arose as to his claim to be considered the author of a considerable part of the work. Cave himself acknowledges his obligations in large terms in his Preface; but after Wharton's death he addressed a long letter to Archbishop Tenison, which is printed in Chalmers's 'Biographical Dictionary,' in confutation of an account of the matter which Wharton had left behind him. The publication of Cave's work (in 1688) immediately made Wharton's name known, and brought him into reputation as a young man of remarkable talents and acquirements. The year before it appeared he had been ordained deacon, and had also taken his degree of M.A., and he was now sought out by Dr. Tenison, then vicar of St. Martin's, afterwards primate, who employed him to translate and compose a Latin manuscript on 'The Incurable Scepticism of the Church of Rome,' written by Jean de la Placette, the French Protestant divine, which it was thought desirable to make public in an English dress. He was also, on Tenison's recommendation, engaged by the second Lord Arundel, of Trerice, as tutor to his son; and about the same time was presented to Archbishop Sancroft, who soon after made him one of his chaplains, and otherwise took him into great favour. Having been ordained priest in November 1688, he was collated the following year both to the vicarage of Minster in the Isle of Thanet, and to the rectory of Chartham. The catalogue of the works which he wrote or compiled, or in the publication of which he was concerned from his first appearance as an author till the close of his short life, makes one of the most notable displays of literary ardour and exertion on record. His biographers enumerate eight or nine treatises which he had already published or edited even before he had taken priest's orders; their titles may be found in the account of his Life prefixed to his Sermons, and, abstracted thence, in the 'Biographia Britannica.' They were principally directed against Popery. The most important was a quarto volume, entitled 'A Treatise of the Celibacy of the Clergy, wherein its Rise and Progress are historically considered,' which appeared in 1688, the imprimatur being dated November 3rd, 1687. In 1691 he brought out at London, in 2 vols. folio, his great work entitled 'Anglia Sacra,' being a collection of original histories of archbishops and bishops in England from the introduction of Christianity to the year 1540. In this undertaking his patron had been Bishop Lloyd, who appears to have generously defrayed all the expenses of transcribing the manuscripts and printing the work. Unfortunately very much of it has been hurriedly prepared, and it abounds with errors both of the printer and of the amanuensis; but the original matter that Wharton has supplied evinces a great command of antiquarian learning; and of many of the pieces in the collection there is as yet no other edition. The 'Anglia Sacra,' accordingly, with all its defects, still retains a high value. In 1692 Wharton published, in 8vo, 'A Defence of Pluralities,' which was held to display great ability. In 1693 he edited, in a 4to volume, some hitherto unpublished works of Bede, under the title of 'Bedae Venerabilis Opera quaedem Theologica,' &c.; and the same year, under the fictitious name of Anthony Harmer, he published an 8vo pamphlet entitled 'A Specimen of some Errors and Defects in the History of the Reformation of the Church of England, written by Gilbert Burnet, D.D.' Burnet replied, acknowledging the ability of his assailant, but complaining of his bitterness and bad temper; and Wharton did not continue the controversy. In 1695 appeared another of the most elaborate and valuable compilations of this indefatigable illustrator of our ecclesiastical history—the first volume, in folio, of 'The History of the Troubles and Trials of Archbishop Laud.' This is Laud's own account, written during his imprisonment in the Tower, accompanied with his Diary of his Life and other papers, printed from the originals, which had been placed in Wharton's hands by Archbishop Sancroft a few days before his death. A second volume, consisting of further collections relating to Laud, was left ready for the press by Wharton, and was published by his father in 1700.

Wharton died at Newton in Cambridgeshire, worn out by his labours, on the 5th of March 1695. Two octavo volumes of his Sermons were printed after his death; and his papers, among which were several transcripts of old English historians, and notes upon various printed books, were purchased by Archbishop Tenison, and are now in the library at Lambeth. The second edition of Cave's 'Historia Literaria,' printed at Oxford, in 2 vols. folio, 1740, 1743, is enriched with many additions from Wharton's manuscripts.

WHARTON, THOMAS WHARTON, MARQUIS OF, was the eldest son of Philip, Lord Wharton,—one of the few noblemen who adhered to the parliament in the civil wars, and who is characterised by Clarendon as "a man very fast" to that side,—by his second wife, Jane, daughter and heiress of Arthur Goodwyn, of Upper Winchendon, in Buckinghamshire, Esq. Mr. Thomas Burt, in a note to edition of Burton's 'Diary' (i. 367), makes him to be the son of whom Lord Wharton's lady is recorded in the Diary to have been delivered on Tuesday, 13th January 1657—an event which his lordship's relation, Sir Thomas Wharton, is stated to have related to the writer "with great joy;" but this we apprehend must be a mistake. The common account is that he was born about 1640. In a note on a passage of Burnet's 'History of his Own Time' (i. 790), in which mention is made of Lord Wharton, Swift says—"famous for his cowardice in the rebellion of 1642;" upon which the Oxford editor remarks, "It was Mr. Wharton, his son, as Speaker Onslow has noted." It is evident that this had repute, on whatever it was grounded, could not have been earned by a person born only in 1657. Besides, Swift, to whom he was personally well known, elsewhere speaks of him in 1710 as having "passed some years his grand climacteric." Mr. Thomas

Wharton, who did not succeed to his father's title till 1696, is stated to have entered parliament in the reign of Charles II.; and from the commencement of his political life he adhered steadily to the Whig party. On the landing of the Prince of Orange at Torbay, in November 1688, he and his father were among the first who joined him; and after the settlement of the new government he was made comptroller of the household, and sworn of the privy council. In April 1697, being now a peer, he was appointed lord-lieutenant of Oxfordshire, and also one of the two chief justices in eyre, then an office of some importance. On the accession of Anne he was removed from his places by the Tory ministry, which then came into power; but after Whig principles re-acquired the ascendancy, his eminent abilities came again into request, and, after having given his assistance as one of the commissioners in arranging the treaty of union with Scotland, he was, in December 1706, created Viscount Winchendon and Earl of Wharton. In 1708, he was appointed lord-lieutenant of Ireland, and he held that post till after the overthrow of the Whig administration of Lord Godolphin in the autumn of 1710. For the remainder of the reign of Anne he was one of the most active leaders of the opposition. In September 1714, immediately after the arrival of George I., he was made lord privy seal, and on the 1st of January 1715, he was created Marquis of Wharton and Malmsbury in the peerage of England, and Baron Trim, Earl of Rathfarnham, and Marquis of Catherlogh in that of Ireland; but he died at his house in Dover Street, London, on the 12th of April in the same year.

The Marquis was twice married: first to Anne, daughter of Sir Henry Lee of Ditchley, in Oxfordshire, by whom he had no issue; secondly, to Lucy Loftus, daughter of Viscount Lisburne, by whom he had the son who succeeded to his honours. Both these ladies were cultivators of literature. Soma account of the first, who died in 1685, and also some poetical pieces written by her, may be read in Nichols's 'Collections,' i. 51-53, and ii. 329. She is highly complimented in various passages by Waller, especially in his 'Two Cantos of Divine Poesy, occasioned upon sight of the 53rd chapter of Isaiah turned into verse by Mrs. Wharton.' Some love-verses by the second (entitled 'To Cupid') are in Nichols, v. 711. The famous ballad of 'Lillibullero,' made on the Earl of Tyrconnel, who had in 1686 been appointed lord-lieutenant of Ireland by James II., going over to his government for the second time in 1688, is said to have been written by Lord Wharton (see Percy's 'Reliques,' iii. 373-376).

The Marquis of Wharton, previously to an account of his eminent abilities and services to his party, appears to have been an object of special dislike to the Tories of his own day. There are two characters of him by Swift, one in his 'Four Last Years of Queen Anne,' which is severe enough; the other dated London, August 30th, 1710, a concentration of bitterness and vexation, in the latter he says, among other things, "He bears the gallantries of his lady with the indifference of a Stoic, and thinks them well recompensed by a return of children to support his family," &c. This would seem to imply that the Marquis's second wife bore him several children; but we learn upon Burnet's 'History of his Own Time,' by Lord Dartmouth, among other caustic things, it is said that the marquis, "in respect to his great sincerity and veracity, went amongst his own party by the name of honest Tom Wharton."

WHARTON, PHILIP WHARTON, DUKE OF, was the son (we believe the only son) of Thomas, Marquis of Wharton, and was born in December 1698. Having early shown great quickness of parts, he was carefully educated at home under the superintendence of his father, whose ambition was to make both a great orator and a great patriot; the latter term meaning in his lordship's notion not only a pure Whig in politics, but further, it would seem, a Presbyterian in religion. Either the training he received, however, or possibly the nature with which he had come into the world, proved more favourable to the intellectual than to the moral progress of the boy. His first folly was an early one, his getting himself married clandestinely at the Fleet, when he was scarcely sixteen, to the daughter of Major-General Holmes, a shock which his father took so much to heart, that it is said to have killed him in six weeks. The old marquis died April 12th, 1715; and the marchioness, also, it is affirmed, killed in effect by the same stroke, followed her husband to the grave in the course of the next year. Yet it is admitted by Wharton's biographers that, although the match he had made was "no ways suitable to his birth, fortune, or character, and far less to the great views which his father had of disposing of him in such a marriage as would have been a considerable addition to the fortune and grandeur of his illustrious family," the lady was unobjectionable, except upon the score of the inequality of her condition, and "deserved infinitely more happiness than she met with in this unfortunate alliance. They appear to have parted soon after the marriage; in the beginning of 1716 the marquis, probably in obedience to directions left by his father, went abroad with a French Huguenot governor to be educated or confirmed in strict Presbyterian principles at Geneva. In passing through Germany, his vanity was gratified by receiving an order of knighthood from some petty court; he also immediately began to run in debt; his Huguenot governor only disgusted him by his "dry moral precepts and the restraints he endeavoured to lay upon him;" the Geneva discipline proved intolerable, and, after a brief space, cutting all entanglements, he left the Huguenot behind, and, "as if he had been flying from the plague," set out post for Lyon, where he arrived on the 13th of October 1716. His next proceeding was to write a letter to the Pretender, then residing at Avignon, which he forwarded with the present of a fine stallion; the Chevalier in return sent for him to his court, where he spent a day, and, it is said, accepted from the soi-disant king the title of Duke of Northumberland. After this he presented himself in Paris, where he visited the widow of James II. at St. Germain, and borrowed 2000l. from her; without however declining the attentions of the English ambassador, Lord Stair, at whose table he repeatedly dined. To get the money from the queen-dowager, who was obliged to pawn her jewels to raise it, he is asserted to have engaged to employ it in promoting the interest of her family in England: at the same time he told a friend who remonstrated with him, that till he could repay what he had thus borrowed, he must remain a Jacobite, but when that obligation was discharged he would return to the Whigs.

Having signalised his stay in Paris by sundry extravagances, he returned to England in December, but soon after set out for Ireland, where he was immediately allowed to take his seat in the House of Peers, although as yet only in his eighteenth or nineteenth year. Whether he had purchased this indulgence by any engagement to support the government does not appear; but he forthwith took that side with all apparent sincerity and zeal, and speedily raised himself to such distinction by the figure he made in debate, that, under age as he still was, it was thought proper to raise him to the highest rank in the English peerage, and on the 20th of January 1718, he was created Duke of Wharton. If we put aside his profligate habits, manners, legitimate and illegitimate, of the royal family, this was certainly the most extraordinary creation of an English dukedom on record; and it may also be regarded as the most remarkable passage even in Wharton's singular career. Notwithstanding the practice which then prevailed of conferring the dignity of a peerage in reserve to gain at present, the attainment of it in such circumstances must be held to bear strong testimony to the impression which the talents of the young nobleman made at his first appearance on the political stage.

This probably was not till after he had attained his majority, early in 1720, that he took his seat in the English House of Peers. His name first appears in the records of the debates on the 5th of April in that year. Up to this time he is said to have continued to support the ministry; but he now warmly joined the opposition to the great measure of the session, the South Sea Bill, in the debate on the motion for its committal, which took place on the above-mentioned day. He also spoke several times on the same subject at the explosion of that wild scheme; and it was in replying to a bitter invective of his, on the 4th of February, 1721, that Earl Stanhope, the secretary of state, dropped down in a blood-vessel, which occasioned his death next day. His next prominent appearance was as an opponent of the bill of pains and penalties against Atterbury, in the great debate about which, on the 15th of May, 1723, on the motion that the bill should pass, he made a long and able speech, a full report of which was soon after published. This is the last speech of the Duke of Wharton's that is noticed in the 'Parliamentary History.' His estate, worth, it is said, 16,000l. a year when he came to it, had by this time become so involv'd, that his property was placed in the hands of trustees, for the benefit of his creditors, and he was allowed only 1200l. per annum. He now, perhaps in the hope of making money by the speculation, set up a twice-a-week political paper, under the title of 'The True Briton:' the first number appeared on Monday, June 3rd 1723; the second, on the following Friday; the 54th and last, on Monday, February 17th 1724. At the same time he exerted all his influence in every other way against the ministry and the court; even getting himself made a member of the Wax-Chandlers' company in the city of London, that he might speak and vote at common-halls and other city meetings. But he soon got tired of that regular mode of work, and giving out that his intention was to retrench for a few years, he went off to the continent, apparently in the early part of the year 1724. Proceeding first to Vienna, he made a distinguished figure at that court for a short time; then he set out for Madrid, "where," says his original biographer, "his arrival alarmed the English minister so much, that two expresses were sent from Madrid to London, upon an apprehension that the duke was received there in the character of a minister himself; upon which his grace was served with an order from the privy seal to summon him home." This order he entirely disregarded: "His grace," says one account (Salmon, in 'Chronological Historian,' under date of June 1726), "being in a coach when it was delivered to him, contemptuously threw it into the street without opening it; and soon after, it is said, declared himself a Roman Catholic." His "endeavours," continues the writer of his life, "to stir up the Spanish court not only against the person that delivered the warrant, but against the court of Great Britain itself, for exercising an act of power, as he was pleased to call it, within the jurisdiction of his Catholic Majesty's kingdom. After this he acted openly in the service of the Pretender, and appeared at his court, where he was received with great marks of favour."

The subsequent conduct of this spoiled child of fortune can only be attributed to a species of madness. His duchess, whom he had entirely neglected from an early period of their marriage, having died, April 14th 1726, he immediately offered his hand to Miss O'Byrne, the

Digitized by Google

daughter of a deceased Irish colonel in the Spanish service, who was then one of the maids of honour to the queen of Spain; her majesty at first refused her consent to their union, but he threatened to kill himself, or at least to die, if she would not relent; and the marriage took place. After this he went to Rome, where he accepted the order of the garter from the Pretender, and openly assumed the title of Duke of Northumberland, formerly bestowed upon him by that personage. But it seems to have been soon discovered that he was likely to be more detriment than service to the cause in which he had thus enlisted himself. "As he could not always keep himself within the bounds of the Italian gravity," says his first somewhat tender biographer, who has been substantially followed in all the later accounts, "and had no employment to divert and amuse his over-active temper, he ran into his usual excesses; which being taken amiss, without falling into actual disgrace, it was thought advisable for him to remove from that city for the present." His next appearance was at the siege of Gibraltar, in the spring of 1727, where, having offered his services as a volunteer to the King of Spain, he was appointed by the Conde de las Torres one of his aides-de-camp. Here, we are told, he was often in the trenches, and exposed himself wherever any service was going forward; but his conduct appears to have partaken quite as much of mere recklessness and bravado as of real gallantry. "He went one evening," it is related, "close to the walls, near one of the posts of the town, and, either called to, dared, or threatened the soldiers of the garrison. They said who he was: he readily answered, 'The Duke of Wharton:' and, though his grace appeared there as an enemy, they suffered him to return to the trenches without firing one shot at him; had they done otherwise he must inevitably have perished." The only injury he received at the siege was a slight wound in his foot from the bursting of a grenade; and as a reward for what he had done, the King of Spain gave him a commission of colonel aggregate to one of the Irish regiments. But this was small compensation for what his frantic conduct lost at home: where, soon after, a bill of indictment was preferred against him for high treason, committed by appearing in arms for, and fighting against, the enemies of his majesty's town of Gibraltar, upon which a conviction followed in due course, and he lost both his peerage and all else that he possessed in his native country. Before this had happened however he had written to the Pretender, proposing to come back to Rome, and received for answer a strong exhortation rather to make the best of his way to England, and try if he could accommodate matters there. On this he set out with his duchess for Paris, where he arrived in May 1725. He immediately waited upon Mr. Walpole, the English ambassador, who received him with some coldness, but was not a little surprised when, at parting, his grace told him he was going to dine with the Bishop of Rochester (the exiled Atterbury). Walpole replied, that if he meant to dine with that prelate, there was no reason why he should tell him of it. His intention, however, was to go to Rouen, and here, where he first heard of his indictment, it is affirmed that he was visited by two emissaries from the English minister (Walpole), who endeavoured to persuade him to avert his fate by making some sort of submission to the government; but he remained deaf to all they could urge. The rest of his history reads like an account of a long fit of drunkenness—which indeed it no doubt in great part actually was. He extorted some further pecuniary assistance from the Pretender, and also from other quarters; but, notwithstanding these occasional supplies and his military pay, he was now commonly involved in all the embarrassments of the most extreme poverty; for whenever he received any money, if it escaped his clamorous rabble of creditors, it was spent as fast as his still untamed profusion and taste for luxury and dissipation could squander it. He moved about as whim, or hope, or extreme desperation led him: first to Paris, then to Orleans, then to Nantes, whence he took ship for Bilbao, and, leaving his duchess there, went to join his regiment, which appears to have been stationed at Madrid. Some time after he is stated to have been in garrison at Barcelona, where he got into a quarrel with the Marquess de Risbourg, governor of Catalonia, the end of which was that he received orders from court not again to enter Barcelona, but to repair to his quarters at Lerida. On this, we are told, giving way to melancholy, he fell into a deep consumption; so that, by the beginning of the year 1729, he had but the use of his limbs, and was not able to walk from his bed to the fireside without assistance. After about two months he rallied somewhat, from drinking a mineral water in the mountains of Catalonia; but in May, having gone with his regiment to Tarragona, he became again as ill as ever; and, going back to the mineral spring, "he fell," says his biographer, "into one of those fainting fits to which he had for some time been subject, in a small village, and was utterly destitute of all succours, till some charitable fathers of a Bernardine convent, which happened to be near the place where he lay, hearing of his miserable condition, offered him what assistance their house afforded." After languishing in the convent for a week, he died there on the 31st of May 1731, and was buried the next day by the monks in the same manner in which one of themselves would have been interred. His widow survived, in obscurity, till February 1777, when she died in London, and was buried in Old St. Pancras churchyard.

The account from which the preceding facts are chiefly extracted was originally published in 8vo, at London, in 1731, under the title of 'Memoirs of the Life of his Grace Philip, late Duke of Wharton, by an Impartial Hand.' It is prefixed to two octavo volumes published in 1732, entitled 'The Life and Writings of Philip, late Duke of Wharton,' but which contain only the 74 numbers of the 'True Briton,' and the speech on the bill of pains and penalties against Atterbury, the paging of which is a continuation of that of the 'True Britton,' although it has a title-page of its own, dated 1724. There is another publication, in two volumes, 8vo, without date, entitled 'The Poetical Works of Philip, late Duke of Wharton, and others of the Wharton Family, and of the Duke's Intimate Acquaintance, particularly Lord Bolingbroke, Dean Swift, Lady Wharton, Doctor Friend, Lord Dorset, Major Pack, the Hon. Mrs. Wharton, &c.' These two volumes however appear to have been all printed in 1727 (before the duke's death), with the exception only of this general title-page and a Life of the duke, which is substantially the same with that noticed above, and is here stated to be "communicated by a person of quality, and one of his grace's intimate friends." The volume contains very little that is even attributed to the duke; but in the second are some letters in prose, addressed to Lady Wharton, his father's first wife, and her poetical paraphrase of the 'Lamentations of Jeremiah.' It is said that Ritson had at one time an intention of collecting and publishing the poetical productions of the Duke of Wharton, which however probably would not be very easily ascertained. Nichols has printed two poems by his grace in the 6th volume of his 'Collection,' pp. 24-33. Pope's highly finished character of him in his 'Moral Essays,' beginning "Wharton, the scorn and wonder of our days," is familiar to most readers.

* WHATELY, THE MOST REV. AND RIGHT HON. RICHARD, ARCHBISHOP OF DUBLIN, was born in Cavendish-square, London, in 1787, the fourth son of the Rev. Dr. Whately of Fulham Park, Surrey. He was educated at Oriel College, Oxford, where he graduated B.A. in 1808, taking a second class in classics and mathematics; in 1810 he gained the university prize for an English Essay; in 1811 he became a Fellow of Oriel; and in 1812 he took his M.A. degree. Oriel College is celebrated

on Jewish Disabilities in the House of Lords,' 1833; 'Remarks on Transportation, in a Letter to Earl Grey,' 1833; 'Sermons on Various Subjects,' 1835; 'Essays on some of the Dangers of Christian Faith which may arise from the teaching or the conduct of its professors,' 1839; 'The Kingdom of Christ delineated, in two Essays on our Lord's account of his Person and the Nature of his Kingdom,' 1841; 'Thoughts on the Proposed Evangelical Alliance,' 1846; 'Introductory Lectures on the study of St. Paul's Epistles,' 1849; 'English Synonyms: a collection of, edited by Archbishop Whately,' 1851; 'Inaugural Address delivered in the Exhibition Pavilion, Cork,' 1852; 'Address to the Members of the Manchester Athenæum,' 1852; 'On the Origin of Civilisation,' a lecture to the Young Men's Christian Association of London, 1855; and 'Thoughts on the New Dogma of the Church of Rome,' 1855. A publication attributed to Archbishop Whately is one entitled 'Lectures on Scripture Revelations respecting Good and Evil Angels,' 1855; an Introduction from his pen is prefixed to 'The Remains of the late E. Coplestone, Bishop of Llandaff,' published in 1854; and he has recently (1856) published an edition of Bacon's Essays with annotations. A work entitled 'Selections from the Writings of Archbishop Whately' is now in progress. To the merit of all these writings must be added the value of the influence exercised by Archbishop Whately in stimulating and superintending the literary labours of others. Few men of the age have led a life of such activity.

WHEATLEY, FRANCIS, R.A., an English painter of various subjects. He excelled in rural pieces with figures, and in landscape, which he painted in oil and water colours. His father was a tailor in London, where Wheatley was born in 1747. He received his first instruction as an artist in Shipley's school, and when young obtained several premiums from the Society of Arts. He assisted Cipriani in his ceiling which he painted for Lord Melbourne at Brocket Hall, Hertfordshire. Wheatley led a very irregular life; "he left London," says Edwards, "for Dublin in company with Mrs. Grosse, with whom he had the folly to engage in an intrigue, for which he was prosecuted and cast in the Court of King's Bench." While in Dublin, Wheatley painted an interior view, of considerable merit, of the Irish House of Commons, in which he introduced portraits of several of the members. One of Wheatley's best works, a picture of the London riots of 1780, was burnt in the house of James Boydell, the engraver, who had made a print of it for Alderman Boydell, who gave 200*l.* for the use of it. Wheatley was elected a member of the Royal Academy in 1791: he died in 1801.

WHEATON, HENRY, an eminent American diplomatist and writer on international law, was born at Providence, Rhode Island, U.S., in November 1785. Having completed his education at Brown University in his native city, he graduated there in 1802; studied law under Mr. N. Serle; and was admitted to the bar. He then passed a couple of years in Paris and London, during which he acquired considerable acquaintance with civil law, and rendered himself a complete master of the French language. On his return to America he settled in New York; commenced practice in his profession, and in 1812 became editor of the 'National Advocate,' which journal he continued to conduct for about three years with great success. He contributed also to it, among other things, a series of disquisitions on the law of nations. In 1815 he was appointed one of the justices of the Marine Court, and the same year he published a 'Digest of the Law of Marine Captures and Prize,' which was received with much favour at the bar. He was about this time appointed reporter to the Supreme Court of the United States, an office he held for twelve years; his 'Reports of Cases Argued and Determined in the Supreme Court of the United States,' in 12 vols., are considered to be of great value. He had besides written a life of William Pinkney; contributed numerous articles to the 'North American Review;' published several orations and addresses; and edited several English and other law books. Mr. Wheaton had by this time taken high rank as a civilian. The degree of LL.D. was conferred upon him by Harvard University in 1819, and by Brown University in 1820. He was called upon to lecture upon the subject of International Law, before the New York Historical Society, the New York Athenæum, and other learned societies. He was appointed in 1821 a member of the convention for revising the constitution of New York; and in 1825 a commissioner for revising the laws of that state. He resigned his office however in 1827, on being appointed by President J. Q. Adams as first chargé d'affaires to the court of Denmark. This important post he held until 1834, when he was transferred to the court of Prussia. During his residence in Denmark Mr. Wheaton greatly increased his reputation as a publicist by his conduct on several matters of considerable importance, and by his despatches, in which various questions of international law and policy were discussed. But he also found time to devote to the study of Scandinavian history and literature, the result of which he published in London in 1831, under the title of 'The History of the Northmen, or Danes and Normans, from the Earliest Times, to the Conquest of England by William of Normandy;' this work he afterwards revised and greatly extended for a French version by M. P. Guillot. He also, in conjunction with Mr. Crabbton, wrote a history and description of Norway, Sweden, and Denmark, under the title of 'Scandinavia.'

On the accession of Mr. Van Buren to the Presidency (1837) Mr. Wheaton was raised to the rank of minister plenipotentiary to the King of Prussia; and during his nine years' tenure of this high office, he was regarded as at the head of the American diplomatists in Europe, and his advice was almost invariably sought by other American ministers in all matters of difficulty, whilst his attainments as a publicist, and his personal character and bearing, gave him great weight and won for him high esteem and respect with the courts and cabinets of the continent. He was recalled by President Polk in July 1846.

Mr. Wheaton's chief literary production, 'The Elements of International Law,' was published in 1836, and at once took its place as a standard work on the important subject of which it treats, and of which it affords a complete survey. This work he followed up by a history of International Law, which he wrote in French in consequence of the Academy of Moral and Political Sciences of the Institute of France offering a prize for a treatise on the subject; it was published at Leipzig in 1841, under the title of 'Histoire du Progrès du Droit des Gens en Europe depuis la Paix de Westphalie jusqu'au Congrès de Vienne, avec un précis historique du Droit des Gens Européen avant la Paix de Westphalie.' The author afterwards remodelled the work and published it in English in one thick volume (New York, 1845), under the title of 'History of the Law of Nations in Europe and America from the Earliest Times to the Treaty of Washington.' Notwithstanding his advancing years Mr. Wheaton continued after his return to America to pursue his usual studies. He had even accepted the offer of the chair of International Law in Harvard University, and was preparing to enter upon its duties, when he was suddenly cut off on the 11th of March 1848. Since his death there has been published a fourth edition of the 'Elements of International Law.' By the late Hon. Henry Wheaton, LL.D. Revised, Annotated, and Brought down to the present time, with a Biographical Notice of Mr. Wheaton, and an account of the Diplomatic Transactions in which he was concerned. By Hon. William Beach Lawrence, formerly Chargé d'Affaires at London."

WHEATSTONE, CHARLES.*

WHETSTONE, GEORGE, a voluminous writer of prose and verse, lived in the latter half of the 16th century. Both the place and time of his birth are unknown; but he claimed kindred with Serjeant Fleetwood, the recorder of London. His history was that of a succession of misadventures. After wasting his patrimony in seeking a place at court: he then served abroad as a soldier, and was an eye-witness to the fall of Sir Philip Sydney at Zutphen: he was next an unsuccessful farmer; afterwards he sailed with the abortive expedition of Gilbert to Newfoundland; and, finally, returning to England, he appears to have been chiefly occupied during the remainder of his life in literary labour, which he had previously practised occasionally, and now attempted with indifferent success as a means of subsistence. He is now chiefly known as having been the author of the rude play (or rather two plays called 'Promos and Cassandra,' which, having been printed in 1578, ranks as one of our earliest extant comedies; while it has the further interest of having the same plot with Shakspere's 'Measure for Measure.' It is reprinted in Steevens's 'Six Old Plays,' 1779. In Chamb.-ers's 'English Poets' is Whetstone's Life of George Gascoigne; a Sunday father work, a curious account, with specimens, will be found in Mr. Collier's 'Poetical Decameron.'

* WHEWELL, WILLIAM.*

WHICHCOTE, BENJAMIN, D.D., was the sixth son of Christopher Whichcote, Esq., of Whichcote Hall, in the parish of Stoke, Shropshire, and was born there on the 11th of March 1610. He studied at Emmanuel College, Cambridge, where he was admitted in 1626, and of which he was elected a Fellow in 1633. Having taken holy orders in 1636, he soon after set up a Sunday lecture at St. Lawrence Jewry Church, and was also appointed one of the university preachers. Meanwhile he had attained distinguished reputation as a college tutor. In 1643, being presented by his college to the living of North Cadbury, in Somersetshire, which vacated his Fellowship, he went to reside there, and married; but early in the next year, on the election of Dr. Samuel Collins from the provostship of King's College by the parliamentary visitors, Whichcote, whose principles were less rigid or uncompromising, though scarcely a greater friend to the existing order in Church and State, was appointed to succeed him. Having taken his degree of D.D. in 1649, he was in that year, or soon after, on the death of Dr. Collins, presented by his college to the rectory of Milton, in Cambridgeshire, on which he resigned his Shropshire living. At the Restoration Dr. Whichcote was removed from his provostship by the new government, rather to mark their disapprobation of the circumstances of his induction than from dislike of the man or his conduct; for he had never signed the Covenant, nor taken any part in the violent proceedings of the times. He retained his rectory of Milton, and, coming up to London, was chosen minister of St. Anne's, Blackfriars. From this church he was burned out by the great fire in 1666; but two years after he was presented by the crown to the vicarage of St. Lawrence, Jawry, on the promotion of Dr. Williams to

* In some instances, not before pointed out, notices of eminent individuals which have been in preparation have not been received in time for insertion in their alphabetical order. The articles on Professors Wheatstone and Dr. Whewell are amongst these; and, with others, will be supplied in a brief Supplement which will follow the conclusion of this Division.

the bishopric of Chester. He died while on a visit to Cambridge, at the house of his friend Dr. Cudworth, master of Christ's College, in May 1683.

Dr. Whichcote is regarded as one of the heads, if not the chief founder, of what is called the Latitudinarian school of English divines, as holding those views of Christianity which attribute least importance to minute points of doctrine, and are favourable to the largest comprehension of such as hold a few principles conceived to be alone fundamental and essential. But it was principally by his preaching and other oral teaching that Dr. Whichcote diffused his opinions while alive. An 8vo volume of his 'Observations and Apophthegms,' taken down from his own mouth by one of his pupils, was published in 1688, and passed at least through two editions. The first selection of his sermons was published, in 8vo, in 1698, by the third Earl of Shaftesbury, the author of the 'Characteristics,' with a preface in which he recommended them as making religion to consist rather in natural goodness of disposition than in anything either divinely revealed or having respect to the rewards and punishments of another life. This collection was reprinted at Edinburgh in 12mo, in 1742, preceded by a recommendatory epistle from the Rev. Dr. William Wishart, principal of the university there. Meanwhile three more volumes of Whichcote's sermons had been published from the original manuscript in 1701-3, by Dr. Jeffery, archdeacon of Norwich, and a fifth volume by Dr. Samuel Clarke, in 1707. A new edition of the whole appeared at Aberdeen, in 1751, in 4 vols. 8vo, under the superintendence of Drs. Campbell and Gerard. There is also a volume of 'Moral and Religious Aphorisms,' collected from Whichcote's manuscripts, which was first published in 1703, by Jeffery, and has been re-edited, with additions, in 1753, by Dr. William Salter. Dr. Whichcote, who was possessed of considerable property besides his endowments, was a person of much active benevolence and charity, and was eminently distinguished for his command of temper and general excellence of character.

WHISTON, WILLIAM, was the son of Josiah Whiston, rector of Norton, near Tewkesbury, in Leicestershire, and was born at that place, December 9, 1667. The materials for his Life are mostly contained in his singular autobiography, published in 1749-50; and from these the account given in the 'Biographia Britannica' is mostly taken. These memoirs, like others of the same kind, are to be read with allowance for the character of the author, in which there was much of vanity combined with unsuspected integrity. There never was a writer of his own life who laid his weaknesses more openly before the public, unless it were Boswell. Whiston was educated by his father (who was blind in the latter part of his life, and employed his son largely as an amanuensis till the age of seventeen. He was then sent as a pupil to Mr. Ashrobat at Tamworth, whose daughter he after wards married. At the age of nineteen he was entered at Clare Hall in Cambridge, where he applied himself to the study of mathematics and the Cartesian philosophy. He took his degree in Lent 1689-90, was elected a Fellow of his college in the following June, and received ordination in 1693. In 1694 his health obliged him to give up his pupils, and he was made chaplain to Dr. More, bishop of Norwich. In this year he became acquainted with Newton, whose 'Principia' he had already studied. In 1696 he published his first work, the celebrated 'Theory of the Earth,' which went through six editions. His fancies on this subject, particularly his management of the comet for the production of the Deluge, are well known: there was a joke against it, which was not without foundation, namely, that he had covered the whole earth with water, without providing any means of drawing it off again. In 1698 he got the living of Lowestoft in Suffolk, and by his subsequent marriage vacated his Fellowship: during his tenure of this preferment he performed his duties with singular disinterestedness and industry. But his connection with the university was soon revived, for in 1701 Newton made him his deputy in the duties of the Lucasian chair, and in 1703 resigned the chair itself, and procured Whiston to be elected as his successor: on this he resigned his living, and settled at Cambridge. In 1702 he published an edition of Tacquet's Euclid, which was several times reprinted. He had also some clerical duties, obtained the character of an eminent preacher, and was fairly in the road to high preferment, when his theological studies, in which he was most assiduous, brought about a gradual change in his opinions, which ended in his becoming an Arian; he finally added the rejection of infant baptism to his system. His views on the matter were much influenced by a conviction which he obtained that the 'Apostolic Constitutions' were not only genuine books, but equal if not superior in authority to any of the books of the ordinary canon. The change in his opinions soon appeared in his sermons and in his writings, which came out with great regularity in successive years. The result was too long even for the 'Biographia Britannica.' Very wide varieties of doctrine were common enough at that time in the Church of England; and, if not made too public, views which were called heresies were connived at. The bishop of Ely (Dr. Patrick), even when Whiston had gone so far as to omit part of the Litany, and had consequently been silenced, contrived to break up the court before the promoter made his appearance; and subsequently contented himself by desiring Whiston not to do the duties of a lectureship which he held at Cambridge, promising that the salary should be continued. But Whiston, whose whole life was one uncompromising act of misfeasance of his own opinions, and defiance of his opponents, immediately resigned both office and salary.

In October 1710, the storm burst upon him. The heads of houses, after several hearings, to which they would not allow Whiston to bring a single friend, banished him from the university, after the usual offer of leave to recant. A year afterwards they declared his professorship vacant. Both proceedings, as being done by the heads without a public trial in the vice-chancellor's court, were highly irregular, if we may trust the opinions given in subsequent affairs of the same kind; but the Court of Chancery confirmed them. Whiston was now thrown upon the world, but he had a small patrimony, and with this, his writings, his public lectures, and the occasional liberality of those who admired his unflinching character, particularly (towards the end of his life) of his son-in-law, he never was in want. His trials however were not yet over, and the heads of them will show how difficult theo, as now, it was to define and prosecute heresy in the Church of England. The lower house of convocation censured his writings in 1711, but the censure happened to get mislaid before it was brought to the queen. Whiston, nothing daunted, published his 'Primitive Christianity' in November, whereupon the lower house applied to the upper house for a censure, but without effect. Further steps were thought of, and the judges were applied to for information on the extent of the powers of convocation: four were of opinion that there was no power to cite a heretic, but the rest were the other way. Still the convocation did not move, and in 1713 a private incumbent in London delated Whiston of heresy before the Dean's court of St. Paul's. The commissary of this court would not assume jurisdiction, but referred the matter to the Dean and Chapter of the Arches, who in turn objected to hear it except as an appeal. The delator thereupon applied to the Chancellor, who appointed a court of delegates, who decided that the Dean of Arches ought to have heard the case, but proceeded to treat it as an appeal made to themselves. Whiston was accordingly cited, and appeared, but not until the court had managed to dissolve the sitting, after declaring him in contempt. This sort of thing happened so often, that we cannot but suspect the courts liked in such cases to take advantage of some party being a few minutes behind his time, and to escape the discussion. The last delegates subsequently declared they would not proceed without a court of adjuncts to determine what heresy was. One of the delegates (a judge) affirmed that he would not take heresy on his shoulders nor on his conscience, and another kept whispering Whiston's counsel (Sir Peter King, afterwards lord chancellor) to make a profitable bargain. Finally, in the course of adjourns, the chief justice declared he would not be a judge of heresy; and so proceedings were delayed till 1715, when all heresy was pardoned by an act of grace; and neither excommunication nor degradation ever followed. Whiston declares himself to have lost "two or three hours' sleep during the whole five years; he hauded about his 'Proposals for finding out the Longitude at Sea by Signals' at the door of the court, and on one occasion presented each of his judges with a sheet, wet from the press, which they supposed was a petition, but which on being opened displayed the following title:—'The Cause of the Deluge demonstrated.' During the remainder of his life Whiston had no serious annoyance for his opinions. He was preached against and refused the communion by the clergy, foremost among whom was the famous Dr. Sacheverel, but he was never averse from controversy, and would have been anything but pleased if he had not excited attention. He was also refused admission into the Royal Society. According to his account, Sloane and Halley one day asked him (in 1720) why he was not a Fellow: he replied, that they durst not choose a heretic; upon which Halley proposed himself and Sloane seconded him. When Newton heard this, he said that if Whiston was chosen a member, he would not be president. The reason of this could not have been disapprobation of Whiston's opinions, for even supposing that Newton was not himself an Arian (which is a disputed point), his most particular friend, Dr. Clarke was one, and we can hardly suppose that he would not endure in a Fellow of the Society the opinions of his own most intimate associate. Whiston states what he considers to be the reason as follows:—"Now if the reader desires to know the reason of Sir Isaac Newton's unwillingness to have me a member, he must take notice that as his making me first his deputy, and giving me the full profits of the place, brought me to be a candidate; [and] as his recommendation of me to the heads of college-s in Cambridge made me his successor; so did I enjoy a large portion of his favour for twenty years together. But he soon perceiving that I could not do as his other darling friends did, that is, learn of him without contradicting him when I differed in opinion from him, he could not, in his old age, bear such contradiction, and so he was afraid of me the last thirteen years of his life." Whiston was a singularly vain man, but no one can read his writings without seeing a good portion of shrewdness mixed up with his vanity. Some of his retorts deserve to be celebrated in the history of such things. Talking with Chief Justice King, he says, "We fell in debate about signing articles which we did not believe, for preferment, which he openly justified, and pleaded for it, saying, 'We must not lose our usefulness for scruples.' I replied, that I was sorry to hear his lordship say so; and desired to know whether in their courts they allowed of such prevaricatou or not. He answered, they did not allow of it. Which produced this rejoinder from me: 'Suppose God Almighty should be

as just in the next world as my lord chief justice is in this; where are we then?' To which he made no answer; and to which the late Queen Caroline added, when I told her the story, 'Mr. Whiston, no answer was to be made to it.'" On another occasion (and this story does not come from Whiston himself, but from the 'Biographia Britannica,' in which the writer assures us that he has it from undoubted authority), being in company with Pope, Addison, Walpole, Craggs, and others, they appealed to Whiston on the subject they were debating, namely, whether a secretary of state could be an honest man. Whiston's reply may be imagined; on which Craggs said, "It might do for a fortnight, but not longer." To which Whiston replied: "Mr. Secretary, did you ever try it for a fortnight?" To which Craggs answered nothing, and Mr. Walpole said he could not answer. The story of his telling Queen Caroline, at her request, one of her faults, taking during public worship, and refusing to tell another till she had amended that one, is well known. Such readiness in conversation, it may easily be supposed, was invaluable to a person in Whiston's position.

There are various circumstances of Whiston's life which it is not necessary to do more than name: his formation of a religious society which met at his own house—his various philosophical lectures, oral and printed—his multifarious speculations on prophecy, particularly his decision that the Jews were to be restored and the millennium to commence in 1766; his speculations regarding the longitude, whether by attempting to moor fixed light-vessels in the sea (which he thought every where fathomable), by the dipping-needle, or by Jupiter's satellites, &c.; his survey of the coasts of England by subscription, which produced a useful chart, &c. He died on the 22nd of August 1752, in London, at the age of eighty-five, having never remitted his efforts for the diffusion of his opinions, nor forfeited in the smallest point his character for courageous consistency. He left several children, one of whom, John Whiston, made a fortune as a bookseller, and published many of his father's later works. His son, Thomas Whiston, died in 1737 only, ære 59 in number. Only one has lasted, the translation of Josephus, published in 1737. This book has been reprinted a great many times, but is of little value. [JOSEPHUS.]

WHITAKER, REV. JOHN, was born at Manchester about 1735, and studied at Oxford, where he took his degree of M.A. in 1759, and B.D. in 1767: he was also a fellow of Corpus Christi College. In Reuss's 'Register of Living Authors of Great Britain' (8vo, Berlin, 1791), there is attributed to Whitaker a 'Survey of the Doctrine and Argument of St. Peter's Epistle, with a Paraphrastical Expositions,' published in 1751; but this is probably a mistake. His first publication appears to have been the first volume, in 4to, of 'The History of Manchester,' which appeared in 1771, and which was followed by a second volume in 1775; the first having been reprinted, with corrections, in 8vo, in 1773. To this also he had published, in 1772, in 4to, a second volume, in 1772, his 'Genuine History of the Britons asserted,' in answer to James Macpherson's 'Introduction to the History of Great Britain and Ireland,' which had appeared the preceding year. Macpherson already made famous by his 'Ossian,' and the Rev. Dr. John Macpherson of Skye, whose 'Dissertations on the Caledonians' James Macpherson had published, with a preface, in 1768, had maintained that the modern Scotch Highlanders were the descendants of the ancient Caledonians spoken of by Tacitus and other Roman writers; Whitaker endeavoured to show that they were sprung from an Irish colonisation subsequent to the Roman invasion of the country. Whichever of the two opinions may be true, or nearest to the truth, it will now be admitted that neither the Macphersons nor Whitaker threw much light upon the subject, and that the speculations of both have been superseded and made quite valueless by subsequent investigations.

In November 1773 Whitaker was appointed morning preacher of Berkeley Chapel, London; but the person, Mr. Hughes, who had given him the situation, thinking proper to dismiss him in about two years after, Whitaker published a statement, under the title of 'The Case between Mr. Whitaker and Mr. Hughes, &c.,' in which, his biographer in Chalmers (a personal acquaintance) tells us, "he expressed himself so indiscreetly that his 'Case' was considered as a libel by the court of King's Bench." This would seem to mean that the publication had been made the subject of an indictment or on action. Having soon after this given substantial proof of his scrupulous orthodoxy by refusing a living in the Church which was offered to him by a Unitarian patron, he remained with nothing but his fellowship till 1778, when he succeeded, on the presentation of his college, to the valuable rectory of Ruan-Langhorne in Cornwall. Taking up his residence here, he became involved in a contest with his parishioners about his tithes, which appears to have almost wholly occupied him for some years; but he proved finally victorious in the courts of law, and after a time, we are told, he had also "the satisfaction to perceive a visible alteration in the behaviour of the principal parishioners, and a mutual good understanding was established between the pastor and his flock." He was an animated and impressive preacher, and in all respects an attentive and zealous clergyman. His principal publications after this were—an 8vo volume of 'Sermons upon Death, Judgment, Heaven, and Hell,' in 1783; 'Mary Queen of Scots vindicated,' in 3 vols. 8vo, 1787, of which a second edition, much enlarged, appeared, in the same number of volumes, in 1790; Gibbon's 'History of the Decline and Fall of the Roman Empire Reviewed,' 8vo, London, 1791; 'The Origin of Arianism disclosed,' 8vo, 1791; 'The Course of Hannibal over the Alps ascertained,' 2 vols. 8vo, 1794; 'The Ancient Cathedral of Cornwall historically surveyed,' 2 vols. 4to, 1804; and 'The Life of St. Neot,' published in 1809, after his death. He had besides projected and in part executed a History of London and a History of Oxford, and at least talked of bringing out Notes on Shakspere and Illustrations of the Bible. He also wrote some fugitive poetry, printed in the collection of the works of 'The Cornwall and Devon Poets,' 2 vols. 8vo; and he contributed many articles to the 'English Review,' the 'British Critic,' and the 'Antijacobin Review.' He died at his rectory some time after having had a stroke of paralysis, on the 30th of October 1808.

As a man, Whitaker appears to have been a person of warm and hearty but generous feelings, better liked by those to whom he was well known than by those who were only for a short time or occasionally brought into contact with him. As a writer he is lively and ingenious, and scatters about a great quantity of curious reading and research; but his learning is more excursive and various than profound or exact, and his fancy is much too active for the strength of his judgment. His most important work certainly is his 'History of Manchester,' which is in fact a description of the general state of the country during the Roman and Saxon Times; much of it indeed is merely conjectural, though set down in the most dogmatic style; but valuable ideas and luminous views are occasionally thrown out.

WHITAKER, REV. THOMAS DUNHAM, LL.D., was descended from an elder brother of Dr. William Whitaker, the Cambridge professor of divinity and eminent polemic of the 16th century. At the time when Dr. Whitaker was born, June 8th, 1759, at the parsonage-house of Rainham in Norfolk, his father was curate there; but the next year he succeeded to the family estate of Holme, in Lancashire, which his ancestors had possessed from about the year 1451. In 1775 he was entered at St. John's College, Cambridge, and in 1780 he proceeded LL.B., with the design of following the profession of the civil law; but having by the death of his father, in 1782, become proprietor of the family estate, he changed his views, and determined to enter the Church. He was ordained deacon in 1785, and priest the next year. It is not stated however that he had any preferment till he became perpetual curate of Holme, in 1797, probably on his own presentation. Having taken the degree of LL.D. in 1801, he was in 1809 presented by the Archbishop of Canterbury to the vicarage of Whalley, and in 1810 to the rectory of Blackburn. He continued to reside into his latter living, he resigned the rectory of Haysham, which he had previously held along with Whalley, but for how long is not stated. He died at Blackburn, on the 18th of December 1821, having by his wife Lucy, daughter of Thomas Thoresby, Esq., of Leeds, who survived him, several children and one daughter, Jane Anne, married to Mr. Nowell in 1816, and a son, his eldest, who had been killed by a fall from his horse the year after.

Dr. Whitaker's publications consist of a number of single sermons and of the following antiquarian works:—1. 'History of the Original Parish of Whalley and Honour of Clitheroe, in the Counties of Lancaster and York,' 4to, 1801 (reprinted, with additions and corrections, in 1806, and again in 1818; 'History of the Deanery of Craven,' royal 4to, 1805, reprinted 1812; an account, in Latin, of the rebellion of 1745, 'De Motu per Britanniam Civico anno 1745 et 1746,' 12mo, 1809; 'The Life and Original Correspondence of Sir George Radcliffe, Knt.,' 4to, 1810; an edition of 'The Visions of Piers Ploughman,' 4to, 1810; a new edition of Thoresby's 'Ducatus Leodinensis, or the Topography of Leeds,' fol., 1816; 'Loidis and Elmete, or an Attempt to Illustrate the Districts described in these words by Bede, and supposed to embrace the lower portions of Aredale and Wharfdale, together with the entire Vale of Calder, co. York,' 4to, 1816. To these is to be added a portion of an intended 'History of Yorkshire,' comprising Richmondshire and Craven, which he left ready for the press, and which was published in folio after his death. He also published, in 1812, an edition in 8vo of 'The Sermons of Dr. Edwin Sandys, formerly Archbishop of York, with a Life of the Author;' and 'The Substance of a Speech delivered at a General Meeting of the Magistrates, Clergy, Gentry, and other Inhabitants of the Hundred of Blackburn, convened at Blackburn, Monday, February 10th, 1817, to support the existing Laws and Constitution of England.' This speech (which is inserted in full in the 'Gentleman's Magazine,' vol. lxxxvii, part i., pp. 213-220) is a strong expression of such anti-democratical and conservative opinions as, whether right or wrong in themselves, might be expected from an enthusiastic antiquary. As an illustrator of the national antiquities, Dr. Whitaker a good deal resembled his namesake, the author of 'The History of Manchester,' with whom he sometimes has been confounded. He was not a mere grubber in the earth for forgotten facts, deriving for the most part their only value from their having dropped out of sight and been thus laboriously recovered, but looked at the past in a poetical spirit, with fancy and feeling—which no doubt however sometimes led him where a colder or duller investigator might not have made the same mistakes. He was also, like the other Whitaker, a good classical scholar, as well as conversant with the learning of the middle ages. Some able articles on antiquarian subjects in the early numbers of the 'Quarterly Review' are understood to have been contributed by Dr. Whitaker.

WHITBREAD, SAMUEL, for many years a leading member in the House of Commons, the son of a wealthy brewer of the same name, by his wife Mary, third daughter of the first Earl of Cornwallis, was born in London in 1758. He inherited the brewery, and, by a clause in his father's will, he was compelled to retain a majority of the shares in his own hands. At his death he held five-eighths, which would of themselves have been a princely fortune; but in addition to this he possessed landed estates to the value of 20,000*l.* per annum (upon the plantations of one of which alone he had expended 120,000*l.*) and large property in the funds. Independent of his personal talents, Mr. Whitbread must in this country have occupied a position among the untitled aristocracy, both on account of his wealth and his connections.

Great pains were taken with his education. He was sent for the usual time to Eton, and removed thence to St. John's College, Cambridge. On leaving the university he made the tour of Europe under the care of Mr (afterwards Archdeacon) Coxe. In 1789 Mr. Whitbread married Lady Elizabeth, eldest daughter of the first Earl Grey; and six years later the lady's brother, Sir Charles, married Mr. Whitbread's sister. Mr. Whitbread entered parliament in 1790, as representative of the borough of Steyning; he continued a member of the House of Commons till his death in 1815, but during the greater part of the time he represented the town of Bedford, in which he possessed large property. As might have been anticipated from his education under Mr. Coxe, and from his family connections, Mr. Whitbread attached himself to the Whig party. During the life of Fox he continued a zealous and personally attached adherent of that statesman, and after Fox's death, Mr. Whitbread, though he could scarcely be called the leader, was one of the men of most influence in the ranks of the disorganised opposition. Though he had received a liberal education, Mr. Whitbread owed his political power rather to natural shrewdness, unquenched sincerity, and vehement energy, than to extensive knowledge or polished oratory or argument. The unimaginative and even common-place character of his mind kept him secure from vacillation or inconsistency; his strong passion made him an active and assiduous member of the legislature; and his benevolence and integrity of purpose lent a moral dignity to his oratorical displays. Like most members of parliament of his character, he could not elevate himself above mere personal conflict, and his vehemence of disposition gave his attacks an appearance of asperity alien to his native kindness of disposition. The most prominent event in Mr. Whitbread's parliamentary career was the impeachment of Lord Melville, which he conducted.

He was a warm advocate of popular education, and a man of deep religious impressions. There was however nothing ascetic in his religion, as may be inferred from the active part he took in the affairs of the Drury Lane Theatre. In private life he was amiable and irreproachable. Mr. Whitbread terminated his own life during a temporary aberration of intellect, July 6, 1815. He had some time previously been liable to attacks of a morbid despondency, under which he imagined himself the victim of conspiracies and the object of public ridicule or condemnation. A local pressure on the brain, discovered on dissection, seems to account sufficiently for this malady.

WHITBY, DANIEL, D.D., an English divine of great celebrity in his own day, and some of whose works are still in considerable repute, was born in 1638, at Rushden, or Rushton, in Northamptonshire. In 1653 he was admitted of Trinity College, Oxford, of which he was elected a scholar in June 1655; he took his degree of B.A. in 1657, and that of M.A. in 1660, and was elected Fellow of his college in 1664. Having taken holy orders, he found a zealous patron in Dr. Seth Ward, bishop of Salisbury, under whose chapain, and collated him in October 1668 to a prebend in his cathedral, and in November following to another. In September 1672, he was admitted chantor or precentor of the same church, and immediately after accumulated the degrees of B.D. and D.D. About the same time he was presented to the rectory of St. Edmund's church, in the city of Salisbury; but, although his life lasted for more than half a century longer, this was the last of his preferments. He died at Salisbury, at the age of eighty-eight, on the 24th of March 1726.

Dr. Whitby's first publications were a series of attacks upon popery, in the course of the active controversy upon that subject which was kept up almost without intermission in England from the Restoration to the Revolution:—'Romish Doctrines not from the beginning,' 4to, London, 1664, in answer to Serenus Cressy; '*Ἀδν κατὰ στάσι*, or an answer to *Sure Footing*' (an anonymous work by a Popish missionary called John Serjeant, alias Smith), 8vo, Oxford, 1666; 'A Discourse concerning the Idolatry of the Church of Rome,' 8vo, London, 1674, in defence of Stillingfleet, and against his popish assailant Dr. Thomas Godden, alias Browne; 'Idolatry and Idolatry of Host-worship proven,' 8vo, London, 1679; 'A Discourse concerning the Laws, ecclesiastical and civil, made against Heretics by Popes, Emperors, &c.,' 4to, London, 1682, reprinted at London in 8vo in 1723, with an Introduction by Bishop Kennet, in which it is erroneously ascribed to Dr. Maurice. In 1671 he also published at Oxford, in 8vo, '*Λόγων τῶν Πάντων*, or the Certainty of the Christian Faith and of the Resurrection of Christ.'

In 1683, unfortunately for his peace and his reputation, he turned aside from attacking the Papists to defending the Dissenters, publishing in that year, at London, an 8vo volume entitled 'The Protestant Reconciler, humbly pleading for condescension to Dissenting Brethren in things indifferent and unnecessary, for the sake of peace, and showing how unreasonable it is to make such things the necessary conditions of communion.' The book (which was anonymous, but the authorship of which appears to have been soon discovered) was immediately attacked with great fury from various quarters: the University of Oxford, in a congregation held on the 21st of July, condemned it to be burnt by the hand of the marshal in the Schools Quadrangle; and at length Whitby, on the requisition of his diocesan and patron, Bishop Ward, signed on the 9th of October a strong expression of his sorrow and repentance for having "through want of prudence and deference to authority" caused it to be printed and published, and his distinct retractation of its two main principles—that it is not lawful for superiors to impose anything in the worship of God not antecedently necessary, and that the duty of not offending a weak brother is inconsistent with all human rights of making laws concerning indifferent things—both of which he now professed to have discovered to be false, erroneous, and schismatical. The same year he also published a second part of the 'Protestant Reconciler, earnestly persuading the Dissenting laity to join in full communion with the Church of England, and answering all the objections of nonconformists against the lawfulness of their submission unto the rites and constitution of that church.'

He now, after publishing a Latin compendium of ethics, 'Ethices Compendium in usum academicæ juventutis,' 8vo, Oxon., 1684, returned to his old subject, the errors of popery, and published 'A Treatise in which the Doctrine of the Latin Servants of Idolatry is discussed,' 4to, London, 1687; 'The Fallibility of the Roman Church demonstrated,' 4to, London, 1687, a treatise against the worship of images; 'A Demonstration that the Church of Rome and her Councils have erred,' 4to, London, 1688, on communion in one kind; and 'Treatise of Traditions,' part i. 4to, London, 1688; part ii. 4to, London, 1689.

He next came forward in defence of the Revolution, in two treatises: the first entitled 'Considerations humbly offered for taking the Oath of Allegiance to King William and Queen Mary,' 4to, London, 1689; the second, 'An Historical Account of some things relating to the Nature of the English Government,' 4to, London, 1689; and these were followed by 'A Discourse confirming the Truth and Certainty of the Christian Faith, from the Extraordinary Gifts of the Holy Ghost vouchsafed to the Apostles,' 4to, 1691; a treatise in Latin against Arianism and Socinianism, 'Tractatus de Vera Christi Deitate,' 4to, Oxford, 1691; and 'A Discourse of the Love of God,' 8vo, London, 1697.

In 1703 appeared, in two volumes folio, his principal work, 'A Paraphrase and Commentary on the New Testament.' This has been often reprinted, and is still held in much esteem by the adherents of the Arminian system of doctrine. The best edition is that of 1760, in 2 vols. folio. in connection with it he afterwards published 'A Discourse of the Necessity and Usefulness of the Christian Revelation, by reason of the Corruptions of the Principles of Natural Religion among Jews and Heathens,' 8vo, London, 1705; 'Reflections on some Assertions and Opinions of Mr. Dodwell, &c.,' 8vo, London, 1707; 'A Discourse concerning the True Import of the words *Election* and *Reprobation*,' 8vo, London, 1710 (commonly called 'Whitby against the Five Points,' and often reprinted; the best edition is that of 1735); 'Four Discourses' (on Election and Reprobation), 8vo, London, 1710; a treatise against the doctrine of Original Sin in Latin, 'Tractatus de Imputatione Divina Peccati Adami Posteris ejus, &c.,' 8vo, London, 1711. Whitby had been bred a Calvinist, his teachers at the university having been all of that persuasion; and, as he states himself in a preface to one of the above tracts, his own investigations and reflections had gradually brought him round to the opposite opinions.

But his views afterwards underwent a still further change. Dr. Clarke's 'Scripture Doctrine of the Trinity,' which appeared in 1712, made him a convert to Arianism, and he afterwards published the following tracts in defence of his new creed:—'Dissertatio de S. Scripturarum Interpretatione' (against the authority of the Fathers in the controversial s about the Trinity), 8vo, 1714; 'A Discourse showing that the Expositions which the ante-Nicene Fathers have given are more agreeable to the Interpretations of Dr. Clarke, &c.' 8vo, London, 1714; 'A True Account and Confutation of the Doctrine of the Sabellians,' 8vo, London, 1716; and a disquisition, in Latin, on the difficulties which attend the study of the doctrine of the Trinity, under the title of 'Disquisitiones Modestæ in Bulli Defensionem Fidei Nicenæ,' 8vo, 1720. This last tract involved him in a controversy with the great Trinitarian champion, Dr. Waterland. Whitby defended himself in two additional pamphlets, published this same year, and replied to his Arian opponent, but, before the end of his life, he appears from his posthumous work entitled '*Τετρὰς Φροντίδων*, or the Last Thoughts of Dr. Whitby: containing his Correction of several passages in his Commentary of the New Testament; to which are added Five Discourses, published by his express order,' 8vo, London, 1728.

Meanwhile he had published another tract on the Romish question, entitled 'Irrisio Dei Panarii Romanensium; the Derision of the Braden God, &c.,' 8vo, London, 1716; and he had also taken part in the Bangorian controversy, by two pamphlets in defence of Bishop Hoadly; the first, 'An Answer to *Dr. Snape's* Second Letter to the

Digitized by Google

Bishop of Bangor,' 8vo, London, 1717; the second, 'A Defence of the Propositions contained in the Lord Bishop of Bangor's Sermons,' 8vo, London, 1718.

To this long list are still to be added six single sermons published at different times between 1671 and 1714: 'Thirty-three Sermons upon the Attributes of God,' 2 vols, London, 1710; 'Sermons on Several Occasions,' 8vo, London, 1720; 'Twelve Sermons preached at the Cathedral Church of Sarum,' 8vo, London, 1726; besides an anonymous pamphlet, entitled 'A Short View of Dr. Beveridge's Writings,' 8vo, London, 1711—a severe attack on Bishop Beveridge—of which he is supposed to be the author.

WHITE, GILBERT, the author of the 'Natural History of Selborne,' was born at Selborne on the 18th of July 1720, and received his early education at Basingstoke, under the Rev. Thomas Warton, father of the poet of that name. On leaving Basingstoke he was admitted a student of Oriel College, Oxford, and took his Bachelor of Arts degree in 1743. He was elected a Fellow of his college in 1744, and became Master of Arts in 1746, and was made a senior Proctor of the university in 1752. He exhibited when young an attachment to literature and the study of natural history; and it was to indulge in these tastes that he retired at an early period of his life to his native village. Here he lived surrounded by his friends, engrossed by his favourite pursuits during the whole of his life; he died on the 26th of June 1793. Although he had frequently offers of preferment in the Church, he declined them all; and that he was averse to the duties of the clerical profession; for during the latter part of his life he acted in the capacity of curate at Selborne, and had previously performed the same duties in the adjoining parish of Faringdon. The work on which the reputation of this naturalist rests, and which must ever claim for him a conspicuous position amongst the cultivators of science, as well as the classical writers of Great Britain, is his 'Natural History of Selborne.' This work was first published in quarto, in 1789, four years previous to the death of the author. In this first edition also appeared a chapter of the antiquities of Selborne, a part of the work which has been often, without sufficient reason, omitted in subsequent editions of the 'Natural History.' After the death of Gilbert White, Dr. Aikin published a work entitled 'A Naturalist's Calendar, with Observations in various branches of Natural History,' the whole work being selected from a natural history journal which had been kept by White for twenty-five years. In 1802 the 'Calendar' and 'Natural History' were published together in two volumes, octavo. In 1813 the 'Antiquities,' 'Natural History,' 'Calendar,' and some poems of the author were published together in one volume, quarto. From this time various editions of these works have appeared, edited by the Rev. John Mitford, Sir William Jardine, Captain Brown, the Rev. L. Jenyns, and other editors. One of the best of the later editions was by the late Edward Turner Bennett, secretary to the Zoological Society. It contains the 'Natural History,' 'Antiquities,' and the 'Naturalist's Calendar,' and is enriched with copious notes by the editor, and by Messrs. Bell, and others; but an edition embodying in notes such general corrections, qualifications, and additions as recent investigations may have rendered necessary, and also a specific account of the present natural history of Selborne, would be a welcome addition to our literature.

The portions of White's writings devoted to natural history are written in an elegant and pleasing style, and give to the reader something of the enthusiasm of the writer. No one can fail wishing to participate in the quiet pursuits of the author in his rural solitude, after reading his letters, and they have much contributed to spread a taste for natural history in this country. But his letters and essays on subjects of natural history are not merely interesting for their style and matter; they contain a large amount of original observation which has contributed much to a knowledge of the form, habits, and instincts of the animals that inhabit Great Britain.

White was peculiarly fortunate in belonging to a family whose members all took great delight in natural history pursuits, and with whom he was in constant correspondence. Four of his brothers are referred to in his letters, and some of them are well known for their literary labours. Most of his brothers and sisters were married, but he died single. He however took great interest in the families of his near relatives, and carefully noted down in diary the births of the nephews and nieces, who at his death amounted to the number of sixty-three.

WHITE, HENRY KIRKE, was a native of Nottingham, where he was born on the 21st of March 1785. He was the son of John White, a butcher of that place, and of his wife Mary, whose maiden name was Neville, and who belonged to a respectable Staffordshire family. He early showed a passion for reading, and had begun to try his hand at composition in prose when he was about seven years old. His first attempts in verse appear to have been considerably later than the earliest that is given or mentioned by his biographer is a short poem stated to have been "written at the age of thirteen." He had now, in addition to writing and arithmetic, acquired an acquaintance with the French language; but up to this time it continued to be the intention of his father to breed him up to his own business, and one whole day in every week, and his leisure hours on other days, were employed in carrying the butcher's basket. At last his mother, who appears to have been a woman of some education, as well as of a superior cast of mind, and who had now, in conjunction with her eldest daughter, opened a girls' boarding- and day-school, which proved very successful, persuaded her husband to give up this plan; and at the age of fourteen Henry, being taken from school, was placed in a stocking-loom, that he might learn the hosiery business. But this proved scarcely more satisfactory than his original destination; and after a year his mother found means to have him placed in the office of Messrs. Coldham and Enfield, attorneys and town-clerks of Nottingham. To make up for the want of a premium, he was engaged to serve two years before the commencement of his apprenticeship, so that he was not articled till the beginning of the year 1802. By this time he had acquired a tolerable knowledge of Latin with very little instruction, and had begun Greek. To these languages he afterwards added Italian, Spanish, and Portuguese; chemistry, astronomy, and electricity also engaged his attention; drawing was another of his pursuits; and he played very pleasantly by ear on the piano-forte. He showed likewise a turn for practical mechanics. All this while too his time was principally occupied by the law, "to which," says his biographer, "his papers show he had applied himself with such industry as to make it wonderful that he could have found time, busied as his days were, for anything else."

By his fifteenth year he had already begun to acquire distinction as a speaker in a literary society in Nottingham, and as a correspondent in various periodical publications, the 'Monthly Preceptor, or Juvenile Library,' the 'Monthly Magazine,' the 'Monthly Visitor,' and the 'Monthly Mirror.' The encouragement of Mr. Hill, the proprietor of the last-mentioned work, and of Mr. Capel Lofft, induced him, about the close of the year 1802, to prepare a volume of poems for the press, but he was not suppear to have been published however till the end of the next year, or the beginnig of 1804, when it came out, dedicated, by permission, to the Duchess of Devonshire. But her grace, after giving her name, forgot to give anything more, or even to notice the poems or their author; and the volume, which was harshly treated by the reviewers, appears to have attracted little of the public attention. It was the means however of making the youthful writer known to Southey, to whom he is principally indebted for the preservation of his memory and the general interest that is still felt about him.

The publication his first volume of poetry was probably a great change had been wrought in his opinions, and his whole intellectual being, by his conversion from an indifference to religion and a tendency towards infidelity, to a deep and passionate conviction of the truth of Christianity. What appears to have been most op-rative in drawing his mind and heart in this new direction was the circumstance of a young friend, who had been some time before suddenly struck in the same way, being about to proceed to the University, a destination which White had often looked forward to with intense desire, though with scarcely a hope. He now bent his whole soul to finding the means of following his friend to Cambridge, and perhaps to be educated for the Church. For some time the prospect was very discouraging; but at last the matter was managed, principally by means of Mr. Simeon, of King's College, to whom he had been recommended, and who procured him a studentship at St. John's, with additional pecuniary assistance. He quitted his employers, who very kindly gave their consent to this arrangement, in October 1804. During his first term one of the University scholarships became vacant, for which he was advised to offer himself as a candidate. He passed the whole term in preparing for this object; but his strength and spirits sank under the exertions, and when the day came he found himself compelled to decline being examined. He had now only a fortnight to prepare for the general college examination: in his exhausted and desponding condition he would have declined that too; but he was prevailed upon to come forward, and was pronounced the first man of his year.

He now paid a short visit to London, the excitement of which probably only accelerated the progress of his disease. The next year, at Cambridge, he was again pronounced first at the college examination. The college now offered him a private tutor in mathematics during the long vacation; but relaxation, not stimulus, was what he wanted. He paid another visit to London, from which he returned to college only to die. His death took place on Sunday, the 19th of October 1806, when he had just passed the middle of his twenty-second year.

His papers were put into the hands of Robert Southey, who in 1807 published a selection from his poems and prose compositions, in two volumes, accompanied with the memoir from which the above facts have been taken. A supplementary volume, consisting of additional pieces, appeared in 1822; and both publications have since been incorporated, and in that form 'The Remains of Henry Kirke White' have been several times reprinted. The popularity which Henry Kirke White's poetry has enjoyed is owing perhaps more to the touching circumstances of his history and the attractive picture of his disposition and character which has been drawn by his enthusiastic biographer, than to its merit. It has in its best passages considerable feeling and melody, but its general tone is feeble, and the manner and spirit decidedly imitative. His requirements also, though considerable for the circumstances under which they were made, were certainly not otherwise very remarkable.

WHITE, REV. JOSEPH, was the son of a poor journeyman weaver of Gloucester, where he was born about 1746. His father brought him up to his own trade, but sent him for a time to a charity-school,

Digitized by Google

where the education he received, whatever it amounted to, had the effect of inspiring him with a love of reading and study, which he carried so far in his leisure hours that his attainments at length attracted the notice of a neighbouring gentleman of fortune, who furnished him with the means of entering himself at Wadham College, Oxford. This was probably when he was about three-and-twenty, since he is stated to have taken his degree of M.A. in 1773. At that date the only one of the Oriental languages which he knew seems to have been the Hebrew. He now began, under the encouragement of Dr. Moore, afterwards successively Bishop of Bangor and Archbishop of Canterbury, to apply himself to the Arabic and Persian, and made rapid progress. In 1774 he was elected to a fellowship in his college (worth about 70*l.* per annum), and next year he was appointed Laudian Professor of Arabic in the University, from which he derived about as much more. On entering upon this office, on the 7th of April 1775, he pronounced a Latin oration on the utility of the Arabic tongue in theological studies ('De Utilitate Linguæ Arabicæ in Studiis Theologicis'), which was printed in quarto the same year, and brought him great reputation. His next publication was an edition, with a translation and notes, of the Syriac Philoxenian Version of the Four Gospels ('Sacrorum Evangeliorum Versio Syriaca Philoxeniana'), from a celebrated manuscript belonging to New College, which appeared in 2 vols. 4to, in 1778. This was followed the same year by a sermon preached before the University, on the 15th of November 1778, recommending a revisal of the authorised English translation of the Old Testament, which was much applauded both for its learning and eloquence. White was now appointed one of the preachers at Whitehall chapel, and, having taken his degree of B.D. in 1779, he continued to keep his name before the public by publishing in that same year 'A Letter to the Bishop of London (Lowth) suggesting a plan for a new edition of the Septuagint;' and the next year, in 4to, 'A Specimen of the Civil and Military Institutes of Timour, or Tamerlane, rendered from the Persian into English.' The completed translation of the latter work, executed by Major Davy, appeared in 4to in 1783, with a preface, index, geographical notes, &c., by White.

Soon after this occurred the most remarkable passage in his life. In Easter Term, 1783, he was appointed to preach the Bampton Lectures for the following year: this duty he executed accordingly with extraordinary effect; and when the question, the object of which was a Brief View of Christianity and Mahometanism, in their History, their Evidence, and their Effects, were published, soon after their delivery, the admiration with which they had been heard from the pulpit was borne out by an equally flattering reception from the reading public, which demanded a second edition of the volume within a twelvemonth. A wealthy prebend in the cathedral of Gloucester, bestowed upon him by the Lord Chancellor (Thurlow), speedily rewarded the learned and eloquent author, who in 1787 took his degree of D.D., and was now looked upon as one of the chief ornaments of the University. Soon after this however a strange discovery was made. In May 1788 died suddenly the Rev. Samuel Badcock, who had for some time been one of the most active and able writers in the 'Monthly Review' and other periodical publications of the day, chiefly on theological subjects; and in his pocket-book was found a promissory note from White for 500*l.*, dated Wadham College, 7th of August, 1786. From letters afterwards found among Badcock's papers it was abundantly proved that this note was granted by White in payment for assistance which he had secretly obtained from Badcock in the composition of his Bampton Lectures. White, upon being applied to, first shuffled, and then tried what he could do by bullying: by his blundering management he provoked the parties in whose hands the secret was, to make an exposure of the whole affair; and then it turned out that Badcock had not been his only coadjutor—that he had also employed the services of Dr. Parr in the same way. Badcock, it would appear, was aware of Parr having a hand in the matter; Parr, mneb to his indignation when the truth came out, had been kept in entire ignorance of Badcock's share in it. White had meanwhile paid the money to Badcock's representatives; but in 1789, Badcock's friend, the Rev. Dr. R. B. Gabriel, preacher at the Octagon chapel in Bath, by whom the discovery had been made, published the whole story in an octavo pamphlet, entitled 'Facts relating to Dr. White's Bampton Lectures.' To this White replied the next year in another pamphlet, which he called 'A Statement of Dr. White's Literary Obligations to the late Rev. Mr. Samuel Badcock, and the Rev. Samuel Parr, LL.D.' This statement smounts substantially to an admission of the charges, the undeniable facts being merely attempted to be excused or apologised for. But the most complete account of this curious affair is that given by Dr. John Johnson in his 'Memoirs of Dr. Parr,' London, 1828, pp. 216-290. The numerous letters which are printed by Dr. Johnson present the strangest development of the system of importunate mendicancy which White appears to have carried on, not only upon his two other occasions. And yet it is difficult after all to assign what would seem to ordinary people an adequate motive for his conduct. He was unquestionably a man of sterling talent, and probably quite capable of writing as good lectures as those he begged or bought; and it could hardly have been indolence that induced him to take the course he did; for the trouble he gave himself in managing his scheme of complicated deception, and in fitting into the form of a continuous writing what he wrote himself and what he got from others, must have been fully equivalent to the labour of original composition. One thing is clear, that his object was of the lowest kind—the producing such discourses as would be most likely to procure him preferment or money, however he might come by them. Parr, it may be added, who in one letter characterises him as uniting to the darkest management the clumsiest execution, always believed that his own and Badcock's secret not the only pens he had laid under contribution; his notion was, that another of White's friends, Dr. John Parsons, afterwards Bishop of Peterborough, was a main auxiliary in the preparation of the Bampton Lectures from beginning to end, though "without being let into the secret of other persons being also employed."

White's calculation as to preferment was not disappointed. He was soon after promoted by the crown to a canonry of Christ Church; besides which, having in 1790 vacated his fellowship by marriage, he was presented by his college to the living of Melton in Suffolk. His subsequent publications were his well-known 'Diatessaron,' or chronological arrangement of the passages in the Greek text of the Four Gospels containing the history of the Life of Christ, which appeared in 8vo in 1800, and has been several times reprinted; his 'Ægyptiaca, or Observations on certain Antiquities of Egypt,' containing the Arabic text, with a Latin translation of Abdallatif's Description of Egypt), 4to, 1801; a critical edition of the Greek New Testament, exhibiting the alterations proposed by Griesbach in the common text, 2 vols. cr. 8vo, 1803; and a sequel to this, in a Latin synopsis of the system of criticism adopted by Griesbach, 'Criseos Griesbachianæ in Novum Testamentum Synopsis,' which appeared in 1811. He died at his residence in Christ Church, May 22nd, 1814.

WHITE, REV. JOSEPH BLANCO, was descended paternally from an Irish family of the Catholic faith. In the early part of the last century, William White went over to Seville, in Spain, where he succeeded to the then flourishing business of an exporting merchant carried on by his mother's brother. He was raised by the king of Spain to the rank of the *nobleza*, which his posterity retained. But when after his death the business fell into the hands of his son, the house failed, and the family were left for a time with very limited resources. This son had married a Spanish lady of the name of Crespo y Neve, connected with the old Andalusian nobility; and Joseph Blanco White, commonly designated in Spain Don Jose Maria Blanco y Crespo, who was born at Seville, 11th July 1775, was their son.

The commercial business of the family had been re-established after the bankruptcy, and Joseph was placed in the first instance in his father's counting-house. When he was about twelve years old however his parents became acquainted with an ecclesiastic, among those to be educated for the Church. In the end of the year 1799 he was ordained a priest. But a dislike to the profession he had thus chosen soon took possession of him. He came to England in March 1810, and spent the remainder of his life in this country. The same year he set up in London a monthly periodical work in Spanish, entitled 'El Español,' which he carried on for nearly five years; and in 1814 upon its discontinuance the English government bestowed upon the editor a pension of 250*l.*, which he enjoyed so long as he lived. About the same time he joined the Church of England, originally with the view of pursuing the clerical profession; but this intention he soon dropped. His religious creed after this gradually passed through various grades, from evangelicalism to unitarianism, then to rationalism, till at last it seems to have nearly evaporated into scepticism. He first made himself generally known to English readers by a series of papers which he contributed in 1820 to the 'New Monthly Magazine,' under the title of 'Letters from Spain, by Don Leucadion Doblado,' and which were afterwards extended and published separately in 1822. In the last-mentioned year he set up a second Spanish Journal, 'Las Variedades,' which was published quarterly, and continued for about three years. Other separate works followed, both in Spanish and English; those among the latter that attracted most attention being his 'Practical and Internal Evidence against Catholicism,' 1825, and again 1826; 'The Poor Man's Preservative against Popery,' 1825, 3 volumes reprinted; 'Second Travels of an Irish Gentleman in search of a Religion,' (in answer to Moore's well known work) Dublin, 2 vols. 12mo, 1833. He was also an occasional contributor to the 'Quarterly Review,' to the 'London Review,' established in 1829 (of which he was also editor for the six months that it lasted), to the 'London and Westminster Review,' to the 'Journal of Education,' to the 'Dublin University Review,' and to the 'Christian Teacher.' He resided occasionally at Oxford and Dublin as well as in London; and in 1839 he settled in Liverpool, where he continued till his death, which took place on the 20th of May, 1841. Of White's writings probably those that will last the longest are the papers which have been published since his death under the title of 'The Life of the Reverend Joseph Blanco White, written by himself; with portions of his correspondence; edited by John Hamilton Thom,' London, 3 vols. 8vo, 1845.

WHITE, ROBERT, an English line and mezzotint engraver, born in London in 1645. He learnt drawing and etching of David Loggan, for whom he drew and engraved many buildings. He has engraved a large collection of English portraits, many of which were drawn by himself from the life in lead-pencil upon vellum. He drew also the heads of Sir Godfrey Kneller and his brother, which are engraved in Sandrart's 'Tentsche Academie,' &c. Sir Godfrey painted White's portrait in return. White engraved the first Oxford Almanac in 1674.

Digitized by Google

He died in 1704. He was busily employed for forty years, and he had amassed about 5000*l.*; yet, says Walpole, by misfortune or waste he died indigent at last: in 1704 a printseller however, in the Poultry, who purchased his plates, made a fortune in a short time. Walpole has given a list of about two hundred and fifty of White's heads, and he acknowledges that it is not a complete catalogue of them.

GEORGE WHITE, the son of Robert White, was also a clever mezzotint engraver and a painter. He was instructed by his father, and he completed some plates left unfinished by him at his death. He excelled his father in mezzotint, and the following heads in this style are very good:—the Duke of Ormond, Lord Clarendon, Sylvester Petyt, Sir Richard Blackmore, Colonel Blood, who stole the crown, and the notorious Jack Sheppard, after Sir James Thornhill.- His last plate is dated 1731, and he probably died a few years later.

WHITEFIELD, REV. GEORGE, the founder of one of the two great divisions of Methodism, was, as well as his fellow-labourer Wesley, of clerical lineage, although his immediate progenitors were of the laity. His great-grandfather, the Rev. Samuel Whitefield, was rector of North Ladyard in Wilts, and afterwards of Rockhampton in Gloucestershire; in which latter charge he was succeeded by a son of the same name, who died without issue. Another of his sons, Andrew, probably his eldest, lived as a private gentleman on his estate. Thomas, the eldest son of this Andrew, was bred a wine-merchant, and followed that business for some time in Bristol, where he married Elizabeth Edwards, a lady respectably connected; but afterwards, having probably been unfortunate, he transferred himself to Gloucester, and there took an inn. He and his wife, besides a daughter, had six sons, of whom George, the subject of this notice, was the youngest. He writes: "I was born in Gloucestershire," says Whitefield himself, "in the month of December, 1714. My father and mother kept the Bell Inn." It appears from one of his letters that his birthday was the 16th of the month.

His father died when he was two years old; but his mother, who continued to keep the inn, did her best, in the midst of declining circumstances, to bring him up creditably, having been used to say, even when he was an infant, that she expected more comfort from him than from any other of her children. "My mother," says Whitefield, "was very careful of my education, and always kept me in my tender years (for which I can never sufficiently thank her) from intermeddling in the least with the tavern business." He has painted the perversity of his youth in dark colours, but he appears to have been nothing more than a lively and somewhat mischievous and wilful boy, with by no more promise of good in him than the reverse. Moreover, Whitefield is compelled to acknowledge that he had his occasional religious aspirations from his earliest years. He had always in fact a good and sensitive heart, and never was capable of any hardened or deliberate wickedness. Even when he took, as he did, the plays home, and had other small charge which his mother left carelessly in his way, he used to give part of the money, he tells us, to the poor. By the time he was ten years of age, too, he had formed the wish of entering the church. "I was always," he says, "fond of being a preacher, and used frequently to imitate the minister's reading prayers," &c. Part of this ambition no doubt was inspired by the pleasure he had already begun to take in the exercise of his fine voice and power of declamation, which were among the greatest of his personal gifts.

He was placed at the grammar-school of St. Mary de Crypt in his native city, when he was about twelve, and here he made considerable progress in Latin, distinguishing himself besides in delivering the speeches at the annual visits of the corporation, and also in acting (often in girl's clothes) plays composed by the schoolmaster for the gratification of the magistrates. But after a time he got tired of this. "Before I was fifteen," he proceeds, "having, as I thought, made sufficient progress in the classics, and at the bottom longing to be set at liberty from the confinement of a school," he persuaded his mother not to let him learn Latin any longer. "I therefore, for nearly two years, left to learn to write only. But my mother's circumstances being much on the decline, and being tractable that way, I began to assist her occasionally in the public-house, till at length I put on my blue apron and my *waiters*, washed mops, cleaned rooms, and in one word became professed and common *drawer* for nigh a year and a half." After about a year, his eldest brother having married, his mother left the inn; and Whitefield, finding that he could not agree with his sister-in-law, followed his mother in a few months. But it appears that neither could her nor son had given up the idea of the latter yet making his way to the university. "Having thus lived with my mother for some considerable time," Whitefield goes on to state, "a young student, who was once my schoolfellow, and then a servitor of Pembroke College, Oxford, came to pay my mother a visit. Amongst other conversation, he told her how he had unhesitatingly all college expenses that quarter, and saved a penny. Upon that my mother immediately cried out, 'That will do for my son!' Then, turning to me, she said, 'Will you go to Oxford, George?' I replied, 'With all my heart.' Whereupon, having the same friends that this young student had, my mother without delay waited on them. They promised their interest to get me a servitor's place in the same college." The result was, that he went back to school, where, he states, he now spared no pains to get forward in his book; and that he was admitted a servitor of Pembroke College in 1733. Before he had left school, the religious element in his character had been strongly developed. His own account is that for a twelvemonth he had gone on in a round of duties, "receiving the sacrament monthly, fasting frequently, attending constantly on public worship, and praying often more than twice a day in private." He was thus in the fittest temper of mind for joining the Wesleys and their associates, who had been already for some years known in the University by the name of Methodists, and of whose proceedings he had heard before he came up. He was introduced to them after he had been about a year at college, and soon shewed that he was to be outrun in zeal by no one. It had happened that, before he and the Wesleys met, White-field had been nourishing his devotional temperament by the same books to which they had devoted themselves—those of Thomas à Kempis, Scougal, and Law.

Whitefield was ordained deacon by Bishop Benson, of Gloucester, 20th June 1736. Soon after, he returned to Oxford, and took his degree of B.A. From the first his preaching made an extraordinary impression. Even the doctrine he delivered was not so novel and arousing as the manner in which he delivered it. Such earnestness, such passionate enthusiasm, had not before been heard from the pulpit in England by that generation. But even this vehemence lay quite as much in the voice and action as in the language of the preacher. Whitefield's voice, which is affirmed to have been so powerful as to be audible at the distance of a mile, appears by general testimony to have been in all other respects one of the most effective for the purposes of elocution ever possessed by man: capable of taking every various tone of emotion, and, whether poured forth in thunder or in softer music, reaching in a way to the heart with irresistible force and effect. Then he gesticulated, he stamped, he wept with a tempestuous abandonment to which the most successful efforts of the counterfeit passion of the stage seemed tame and poor. He first came up to London in 1737, to officiate for a time in the chapel of Dr. Hutchings; but his first sermon was delivered and preached in Bishopsgate church. He then officiated for a few months as curate at Dummer, in Hampshire. While he was here he received from his friends the Wesleys, who were then in Georgia, in North America, an urgent invitation to follow them to that settlement. With this he immediately resolved to comply; but before leaving England he went to pay a farewell visit to his friends in Gloucester; and in that city and Bristol, and afterwards in London, he preached to such overflowing audiences, and with such extraordinary effect, as made the whole country ring with his praises. Breaking away from these and all the inducements that were held out to keep him at home, he embarked for Georgia on the 23rd of December 1737, although it was not till the end of January following that, owing to contrary winds, the vessel got fairly under weigh, about the very time that the ship which brought Wesley back to England was getting into the port from which Whitefield had sailed.

Whitefield remained in America till towards the close of the year. He then returned to England, mainly with the view of raising subscriptions for the erection of an orphan-house which he had established in Georgia, and which continued to be a principal object of attention with him during his life. Now began that course of preaching in association with Wesley, which may be said to have blown into a flame the sparks kindled by their previous separate exertions, and to have established Methodism as a popular faith. It was Whitefield who set the first example of preaching in the open air, which he did on the afternoon of Saturday, the 17th of February 1739, on Hannam Mount, at Rose Green, to the colliers of Kingswood, near Bristol.

From this time forward his life was spent in incessant movement from place to place, and exercise of his wonderful power of exciting and swaying the feelings of all orders of persons by his peculiar pulpit oratory. He repeatedly revisited America, and traversed the whole extent of the British possessions there; when on this side of the Atlantic he preached generally made a round through England and Scotland; he was several times in Ireland; and in 1754, on one of his voyages to America, he spent a short time at Lisbon. To the end of his life his popularity as a preacher remained almost unimpaired; multitudes, at least, continued to crowd to him wherever he appeared, and to hang with absorbed attention on his lips, although, as in the case of Wesley also, the more extravagant effects which his appeals had at first in many instances produced soon ceased to be commonly exhibited. Nor was it only the unlettered that he interested and delighted. It was in the year 1748 that he became known to Selina, countess of Huntingdon, who made him one of her chaplains. This connection introduced him to the highest circles both of rank and literature in the metropolis; and among his admirers and frequent hearers were now to be found not only numbers of court beauties and persons of both sexes of the first distinction in the world of fashion, but such men as Chesterfield, Bolingbroke, and Hume. So also in America he was listened to with wonder and complacency by Benjamin Franklin.

Whitefield and Wesley were in various respects very unlike one another, and, as is well known, they did not long continue to co-operate. They quarrelled, so early as in 1741, about the great question of predestination; Wesley declaring for the Arminian theology, the milder nature of Whitefield, contrary to what might have been expected, standing up for the Calvinistic system of irresistible fate and eternal decrees of election and reprobation. They never came to

Digitized by Google

agree upon this high matter; but the inflammation of feeling which their difference at first excited on both sides soon cooled down, and although they never again acted in concert or association, their occasional intercourse was renewed long before they left the world. Whitefield, who felt that he was likely to go the first, always spoke of Wesley as the man who ought to preach his funeral sermon; and Wesley actually performed that office for his old friend.

Whitefield lost his mother, in the seventy-first year of her age, in December 1751. While he was in America in the spring of 1740, he applied to two of his friends, a Mr. and Mrs. D. to ask if they would give him their daughter to wife, at the same time telling them that they need not be afraid of sending him a refusal; "for I bless God," said he in his singular epistle, "if I know anything of my own heart, I am free from that foolish passion which the world calls love. . . . But I have sometimes thought Miss E——— would be my helpmate; for she has often been impressed on my heart." This attempt came to nothing; but the next year, on the 11th of November, he was married in England to Mrs. James of Abergavenny, a widow of between thirty and forty, who, he intimates, was neither rich nor beautiful, but had become religious after having once lived like the rest of the world. When his wife became pregnant, he announced publicly that the child would be a boy, and become a preacher of the gospel; he was right as to the sex, but the infant died at the end of four months. His wife died in 1768; and one of his friends, Cornelius Winter, has recorded that Whitefield and she did not live happily together, that "she certainly did not behave as she ought," and that "her death set his mind much at rest."

Whitefield himself, whose health had begun to give way about 1757, died at Newbury Port, near Boston, in America, on the morning of Sunday, the 30th of September 1770. His printed works, besides an edition of Clarke's 'Commentary on the Bible,' which he published in 1726, consist principally of sermons, either printed from his own manuscripts or taken down by reporters as delivered; of a few controversial tracts and other occasional pieces; of a copious journal of his life and labours, and of three volumes of letters, amounting to 1465 in all, and extending over the time from July 28, 1734, to within a week of his death. A collection of his sermons, tracts and letters, in 6 vols. 8vo, was published at London in 1771: his journals, like Wesley, he published in his own lifetime; the second edition, with considerable corrections, appeared in 1756.

WHITEHEAD, PAUL, was the youngest son of Edmund Whitehead, a tailor, of Castle Yard, Holborn, London, where he was born 6th of February 1710, o.s., being St. Paul's day, from which circumstance he is said to have derived his Christian name, ludicrously unsuitable to his character, and made more memorably ridiculous by his brother satirist Churchill's well known lines—

> "Mey I (can worse disgrace on manhood fall?)
> Be born a Whitehead and baptised a Paul!"

On leaving school he was placed as apprentice to a mercer in the city; but he afterwards found means, in what way is not explained, to escape from this position, and to enter himself at one of the inns of court as a student of the law. It does not appear that he was ever called to the bar; but in 1735 he obtained wherewithal to live in idleness, or without a profession, by marrying the only daughter of Sir Swinnerton Dyer, Bart., of Spain's Hall, Essex, with whom he received a fortune of 10,000*l*. The lady, who did not live long, is stated to have been young, but very homely in her person and little better than an idiot. Two years before this he had published his first poem, entitled 'State Dunces,' a satire upon the ministry, which he inscribed to Pope, and which brought him both into notice with the public and into favour with the opposition, then headed by the Prince of Wales. This was followed, in 1739, by another piece, entitled 'Manners,' in the same strain, but written with so much more daring that, on the motion of Lord Delawar, the author and his publisher, Dodsley, were ordered to attend at the bar of the House of Lords, and Whitehead found it necessary to abscond for a time. He was now, along with Ralph Upton whom he had poured unsparing abuse and contempt a few years before, in his 'State Dunces'), a Dr. Thomson, and others, one of the pack of literary lackeys kept about him by Bubb Dodington; and he distinguished himself by his zealous assertions in the cause of his patron, not only by his pen, but at elections and in other ways. Besides 'The Gipsy-tribe,' a diatribe against boxing, which appeared in 1744, another satire against the government, entitled 'Honour,' which he published about the same time, and 'An Epistle to Dr. Thomson,' in 1755, were the principal productions of this part of his life. Another of his patrons and boon associates was the notorious Sir Francis Dashwood, afterwards Lord de Despenser. Whitehead made one, with Dashwood, Sir Thomas Stapleton, Wilkes, and others, in the infamous revelries of Medmenham Abbey. In return Dashwood procured for him the household place of deputy treasurer of the chamber, which is said to have been worth 800*l*. a year, and which he held till his death. He spent his latter days at a villa which he erected on Twickenham Common; but he died at his lodgings in Henrietta-street, Covent-Garden, London, 30th December 1774. His collected works—nearly all the veriest rubbish—were published, in a 4to volume in 1777 by Captain Edward Thomson, with a memoir of his life.

WHITEHEAD, WILLIAM, was the son of a baker of Cambridge, where he was born in 1715. The interest of Mr. Bromley, afterwards Lord Montfort, who was one of the county members, procured him a nomination to Winchester; and after passing through that school, where he had been only two years when his father died, he was admitted a sizar at Clare Hall, Cambridge, in 1735, on one of the scholarships founded by Mr. Thomas Fyke, who had, like Whitehead's father, been a baker in Cambridge, and had directed that they should be given in preference to the sons of deceased members of that trade. He was elected a Fellow of his college in 1742. In 1745 he became tutor to the son of William, third Earl of Jersey, and about a year after resigned his fellowship. In 1754 he went abroad with his pupil and Frederick Nuneham, the son of Earl Harcourt. After spending a summer at Rheims and a winter at Leipzig, they proceeded to Vienna, and thence to Italy, returning through Switzerland, Germany, and Holland, and reaching home in September 1756. During his absence from England, Whitehead had, by the interest of his patrons, been appointed to the patent place of secretary and registrar to the Order of the Bath; and the year after his return he was nominated to the office of poet laureate, vacant by the death of Colley Cibber. Both these offices he held till his own death, on the 14th of April 1785.

Whitehead began very early to be known as a writer of verse; and his poems, consisting of epistles, tales, essays, odes, &c., were twice collected and printed under his own direction, first in 1754 and again in 1774: a third edition was published by Mason, with a memoir of the author, immediately after his death, in 1788; and they are also inserted in Chalmers's edition of the 'English Poets,' 21 vols. 8vo, 1810. They are now however entirely neglected and forgotten. His most esteemed production is his tragedy of 'The Roman Father' (founded in part upon the 'Horace' of Corneille), which was first brought out at Drury Lane in 1750, and long continued a stock play. He is also the author of another tragedy called 'Creusa, Queen of Athens,' first produced in 1754; of 'The School for Lovers,' a comedy, in 1762; and of 'A Trip to Scotland,' a farce, brought out with considerable success in 1770.

WHITELOCKE, BULSTRODE, was born August 2, 1605, in Fleet Street, London, the son of Sir James Whitelocke, who was a judge of the Common Pleas, by Elizabeth, the daughter of Edward Bulstrode. He was thus descended both by father and mother from wealthy families. He was educated at Merchant Taylors' School in London, and in March 1620 was admitted at St. John's College, Oxford, where Laud was then president, from whom he received kindness which occasioned him subsequently to refuse to be one of the commissioners of the House of Commons appointed to draw up the charges against him. He quitted the university without taking a degree, and entered himself at the Middle Temple, where, under his father's guidance, he acquired much skill in the common law, and made considerable progress in other studies. He was chosen one of the managers of the Royal Masque presented by the Temple to Charles I. and his consort at Whitehall in 1633. In November 1640 he was elected member of the Long Parliament for Great Marlow in Buckinghamshire, in which county he had considerable property, and one of his earliest speeches was in defence of his father for having committed Selden to prison in 1626, when accused of too great boldness of freedom in parliament. He was appointed a member of the committee for managing the impeachment of the Earl of Strafford. He had thus early taken a decided part against the despotic measures of Charles I. and his ministers, but tolerance and moderation ever formed conspicuous traits in his character. He was an excellent specimen of the intelligent country gentleman, who, though fixedly determined not to submit to a tyranny, were yet unwilling to support violent measures, though often compelled to act with their party in matters they could not approve rather than break with them altogether. The support of such men was eagerly sought by the leading spirits of the party, but their influence was not sufficient to control the direction of the movement. In 1641, on the militia question Whitelocke contended that the power was neither vested in the parliament nor the king, but in both jointly. In 1642 he was appointed a deputy lieutenant of Bucks and Oxon, and in conjunction with Hampden dispersed the commissioners of array, assembled at Watlington. In October of this year his house at Fawley Court, in Buckinghamshire, was rifled by Prince Rupert, and garrisoned by the king's troops. Whitelocke was present at the defence of Brentford in November 1642. In January 1642-43 he was appointed one of the commissioners to treat of peace at Oxford, and one of the lay members of the Assembly of Divines, in which he opposed the pretensions of the Presbyterians, and earnestly, but vainly, sought to bring about an accommodation with the king. In 1644 he was made governor of Windsor Castle, and again, with Hollis and others, a commissioner to treat with the king at Oxford, where his desire for peace led him to make certain secret propositions to the king, which were revealed, and brought him into some danger. He opposed the self-denying ordinance, but when Essex was about to bring accusations against Cromwell, he gave him an early intimation of it, and thenceforward had much of his confidence. In April 1645 he became one of the commissioners of the Admiralty, and caused the books and manuscripts at Whitehall to be removed and taken care of. He was one of the commissioners for the treaty of Uxbridge, and on August 6, 1645, supported in the House

Digitized by Google

of Commons the acceptance of the king's propositions. In June 1646 he was one of Fairfax's council of the siege of Oxford, and urged that honourable terms should be offered, in order to avoid damaging the university buildings. In December 1646 he supported the ordinances for taking away the arbitrary power of both Houses of parliament, and opposed the disbanding of the army. In 1647–48 he withdrew for a time from the House in order to avoid being called on to act as Speaker. In March 1647–48 he was appointed one of the commissioners of the Great Seal. Shortly after the purging of the House of Commons by Cromwell and the soldiers, on December 6, 1648, "a sad and most disorderly day," as he himself calls it, though not expelled, he retired. He had been named one of the members to draw up the charges against Charles, but declined the commission, "being resolved to avoid meddling in that bad business . . . . it being contrary to his judgment, as he himself declared in the House." This is his own statement in his 'Memorials,' and it marks the character of the man, too conscientious to do what he thought wrong, but without sufficient vigour of mind to oppose himself against a powerful party with whom he had many feelings in common. Though he refused to take any part in the proceedings of the High Court of Justice, he had frequent and free conferences with Cromwell. In February 1648–49 he declared in the House his disapprobation of the proceedings on the king's trial, but was within a few days ordered to draw up a bill for abolishing the House of Lords, and was made one of the commissioners of the Great Seal, both of which he wished to decline, but was not allowed. While in this office he rescued the royal library and the medals at St. James's from being sold, and provided for their safe keeping. In 1650 he was at the head of a commission to consolidate the statute laws. In Dec. 1652 he proposed in the House that terms should be made with the Prince of Wales or Duke of York, and in November 1652 urged the same course on Cromwell, who, he says, thereupon began to look cool upon him, and would have sent him as commissioner to Ireland, but he refused to go. On April 20, 1653, he unsuccessfully opposed the dissolution of the parliament, and Cromwell, offended, did not name him to his first parliament. In September 1653 however he was appointed ambassador to Queen Christina of Sweden, of which embassy he left an interesting account. As ambassador he resolutely maintained the dignity of his country, and insisted successfully on all the usual respect paid to the ambassadors of the sovereigns of Europe. He was not a man to succumb to outward dignity or even physical danger; it was the influence of genius only that kept his powers in subordination. He returned in June 1654, having concluded a satisfactory treaty, and in the same year was elected member for Buckinghamshire in Cromwell's second parliament, but on its dissolution, and the issue of an ordinance by the Protector for regulating the jurisdiction of the chancery courts he resigned the Great Seal, and was made a commissioner of the treasury. Though Cromwell knew that Whitelocke did not approve of his present policy, he had much confidence in his truthfulness, honesty, and good sense, and therefore frequently consulted him on important matters. Whitelocke recommended him to govern by means of parliaments, which advice, though he could not refuse upon flopping it to its full extent, gave no offence, and Whitelocke was appointed one of the council of trade, and to negociate a treaty with the Swedish ambassador in England. In the third parliament he acted as Speaker during Sir J. Widdrington's illness, and as one of a deputation from the House to Cromwell to take the title of king; but he attended at his inauguration as Protector in June 1657, with the Speaker and others investing him with the purple velvet robes, and riding in one of the boots of the state coach with the Protector's son, Richard. Shortly afterwards he applied for the provostship of Eton College, then vacant by the death of Dr. Bowne, but not receiving it he retired to private life for a while. In December 1657 he was appointed one of the Lords of the Other House, and again advised the Protector against the frequent dissolutions of parliament. In April 1658 he was appointed one of the commissioners of the High Court of Justice for the trial of Dr. Hewett for high treason, though he had previously advised Cromwell to have recourse to the common law courts, and he therefore refused to act. These instances of opposition did not altogether lose him the esteem of the Protector, one of whose latest acts was to create Whitelocke a Viscount on August 21, which title he declined to accept, and on September 3, Cromwell died. Richard, in January, made him one of the commissioners of the Great Seal, and consulted him about dissolving parliament, the judiciousness of which measure Whitelocke doubted. On the meeting of Officers that displaced Richard, Whitelocke's office ceased, but he was named one of the Council of State on May 13, and as its president took successful measures for repressing the insurrection of Sir George Booth. He joined in an engagement to renounce the title of the house of Stuart, or the government of a single person, and he brought a bill before parliament for effecting a Union with Scotland. General Monk, then in Scotland, sent him an invitation to repair thither, but he declined, and continued to support the government until the remains of the Long Parliament being reassembled on December 26, 1659, he found that he was in danger. He therefore sent the Great Seal by his wife to Lenthal, the Speaker, and retired into the country, though it would appear from Lord Campbell's 'Lives of the Chancellors' that he proposed carrying the Great Seal to Breda, and would have done so but for the timidity of Fleetwood. On the Restoration a small majority in the House of Commons inserted his name in the Act of Pardon and Oblivion. He retired to his estate of Chilton in Wiltshire, that at Fawley Court having being rendered uninhabitable by the royal troops, where he lived for fifteen years, dying on January 28, 1676. He left a number of manuscripts, of which 'Memorials of the English Affairs from the beginning of the reign of King Charles the First to the Happy Restoration of King Charles the Second,' was printed in 1682, again in 1732 with many additions, reprinted at Oxford in 4 volumes in 1853, and is a valuable contribution to the history of the period. His 'Journal of the Swedish Embassy in 1653 and 1654 from the Commonwealth of England,'—a most interesting work—was first published in 1772, and was again printed in 1855, carefully edited by A. Reeve. In 1709 was published 'Memorials of the English Affairs from the supposed Expedition of Brute to this Island, to the end of the reign of King James the First, published from his original manuscript, with some account of his life and writings, by W. Penn, Esq. governor of Pennsylvania, and a preface by James Welwood, M.D.' Several of his speeches are reported in his 'Memorials,' and elsewhere.

WHITGIFT, JOHN, ARCHBISHOP, the third primate of the Protestant Church of England after the Reformation, in the reign of Queen Elizabeth, was distinguished for his learning and for his zeal on behalf of the new establishment. He was the son of a merchant at Great Grimsby in Lincolnshire, where he was born in 1530. He was educated there at an early age to the care of his uncle, Robert Whitgift, the abbot of a monastery of Black Canons dedicated to St. Augustine, at Wellow, or Welhove juxta Grimsby. To this circumstance the decided and consistent character of Whitgift's religious views may be chiefly attributed; for the abbot had predicted the downfall of the Roman Catholic Church, on account of its corruptions, some years before the Reformation, and had often been heard to say "that he had read the Holy Scriptures over and over, but could never find there that their religion was founded by God." The mind of his pupil was therefore prepared at an early age to approve and hold fast to the doctrines of the Reformation, which were then rapidly spreading both in Germany and in England. After studying for some years with his uncle, young Whitgift was sent by him to an eminent school belonging to St. Anthony's, a religious house, situated between Broad-street and Threadneedle-street, London. While at this school he lodged with his aunt in St. Paul's Churchyard, a staunch Roman Catholic, to whom he gave great offence by his aversion to the ceremonies of the church. She in vain endeavoured to persuade him to accompany her to St. Paul's and attend at mass, and at last determined to keep him no longer under her roof. On sending him home to his father in the country, she said "that she thought at first that she had received a saint into her house, and now she perceived he was a devil." In 1584 he was sent to the University of Cambridge, where he was entered at Queen's College. Thence he soon removed to Pembroke Hall, which had a more Protestant character, Bishop Ridley being the master, and Bradford (the martyr) and Grindal, fellows of that college.

In 1554 he commenced Bachelor of Arts, and in the following year was elected fellow of Peter-house. At this college he formed a strong attachment to the master, Dr. Andrew Perne, to whom he was indebted for much kindness and protection, which he never forgot. As he had pursued his studies at Cambridge in the reign of Edward VI., when the Protestant faith had been encouraged and protected, he made no secret of his opinions; but on the accession of Queen Mary he found himself, in common with other members of that university, in serious danger. Cardinal Pole, then archbishop of Canterbury, and the pope's legate, ordered a visitation of the university, and, in 1557, sent commissioners to Cambridge to extirpate the Reformed religion, and to censure and punish its professors. Whitgift was so much afraid of this visitation, that he had determined to escape it by quitting the university and going abroad. He was fortunately dissuaded from this intention by Dr. Perne, who contrived to screen him from the search of the visitors. His fears however were not exaggerated, for not only the public opinions and characters of men were canvassed, but their very books for private study were searched out, and, if deemed heretical, were burned in the market-place. The bigotry of the visitors was displayed by digging up the dead bodies of Bucer and Fagius, and burning them in the market-place: and Whitgift had good reason to be grateful for his impunity. In this perilous year he took his degree of Master of Arts, and during the remainder of Queen Mary's reign he continued his studies at the university, maintaining a cautious reserve as to his religious views. The accession of Elizabeth opened to him the happy prospect of preaching the gospel conscientiously, as a minister of the Protestant Reformed Church of England, and in 1560 he entered into holy orders, and preached before the university at St. Mary's. He continued his residence at Cambridge for upwards of fifteen years, being distinguished for his learning and talents, and holding many high offices and preferments. His lectures as the Lady Margaret's professor of divinity obtained him much distinction. In 1567 he was chosen master of Pembroke Hall, but only remained in that situation for three months; for his fame as a preacher having obtained him the honour of preaching before the queen, he acquitted himself so well that she made him her chaplain, and shortly afterwards master of Trinity College, Cambridge. In the same year also he took the degree of D.D., and succeeded Dr. Hutton as Regius Professor of

Digitized by Google

Divinity. In 1568 the bishop of Ely, Dr. Cox, whose chaplain he had been for some time, conferred upon him a prebend in his cathedral.

Meanwhile Dr. Whitgift was taking an active part in the government of the university, for which purpose he drew up, with the vice-chancellor and some of the heads of colleges, a body of new statutes. He was very strict in enforcing discipline and close conformity with the Established Church; and his activity in restraining any laxity of doctrine or practice in the university, while it brought him into much contention and raised him many enemies, may be regarded as the main cause of his future advancement in the Church. Mr. Cartwright, the Lady Margaret's professor of divinity, having in his letters attacked episcopacy, the Church Liturgy, and other institutions settled at the Reformation, Dr. Whitgift challenged him to a public disputation, which was refused by him; and while the judicial proceedings against Cartwright were pending, which ended in his expulsion, he wrote an elaborate confutation of these schismatic opinions, and laid it before Archbishop Parker. In 1571 he filled the office of vice-chancellor to the university, and in the following year was elected prolocutor of the Lower House of Convocation. At this time a book was published, called 'An Admonition to the Parliament,' being a violent attack upon the entire constitution of the Reformed Church, its sacraments, its Liturgy, its dignitaries, and ministers. It was looked upon by the whole church as a most dangerous book, and Dr. Parker, then archbishop of Canterbury, who had already had many opportunities of judging of Whitgift's zeal and capacity, desired him to undertake an answer. This he accordingly did, under the immediate inspection and with the constant advice and assistance of the archbishop. His answer was published in the same year as the Admonition, and was an able work, of great learning, and evincing much skill in controversy. He treated the doctrines of his opponents with severity, but in a manner temperate, dignified, and lofty; and in his vindication of the compilers of the Liturgy, and other ancient institutions objected against in the Admonition, his zealous and reverential feelings are expressed in a tone of worthy eloquence. The Admonition had been supported by other pamphlets, to all of which Dr. Whitgift addressed replies in his Answer to the Admonition. Cartwright, who had now been expelled from the university, published a reply to Dr. Whitgift's Answer to the Admonition, to which Whitgift prepared a Defence. His labours in this controversy met with the approbation of all those who were well affected to the Established Church, and obtained for him the deanery of Lincoln from the queen. Nor did his preferment rest here long, for on a vacancy occurring in the see of Worcester in 1576, he was appointed to be bishop of that diocese.

Here also his activity and zeal were conspicuous. His diocese was very full of Roman Catholics, at a time when their discovery and punishment were enjoined as the duty of the Church and the civil magistrate. He now acted in both capacities, having been appointed vice-president of the Marches of Wales in the absence of Sir Henry Sydney, the lord-president, then lord-lieutenant of Ireland. He exerted himself to repress the papacy on the one hand, and dissent or Puritanism on the other, and repeatedly obtained the thanks of the Privy Council for his success. At the same time he protected the rights and interests of the clergy of his diocese. The strictness of his orthodoxy and the severity of his discipline were displayed at a time most favourable for his purposes. Grindal, then archbishop of Canterbury, had given great offence to the queen by his leniency to schismatics, and at length, on refusing to obey the queen's orders in suppressing prophesyings (or meetings of the clergy for worship and the discussion of religious subjects in private houses), he was suspended from his office by the Star Chamber, and confined in his own house. Grindal, a meek and timid man, was anxious to resign at once his office and its cares: and Elizabeth offered the archbishopric to Whitgift, which he however declined to accept during the life of Grindal. That prelate soon afterwards died, and in 1583 Whitgift succeeded him.

The queen's zeal for orthodoxy was now at its height, and the new archbishop lost no time in proving his determination to enforce conformity. He immediately required all the clergy to subscribe to three articles before they were permitted to execute any ecclesiastical function, viz.:—1, That the queen was the supreme head of the church; 2, That the Ordinal and Book of Common Prayer contained nothing that is contrary to the Word of God; and 3, That the Thirty-nine Articles were to be admitted as agreeable to the Holy Scriptures. He suspended all the clergy who refused to subscribe to these articles, introduced greater strictness in the admission to holy orders, and exacted compliance with all the forms and ceremonies of the Church. He also obtained from the queen a new ecclesiastical commission, with greater powers than any of the preceding commissions, and this he never flinched from exercising. Henceforward, from his high station in the Church and his personal influence with the queen and her councillors, his biography may be said to be the ecclesiastical history of England during the remainder of the reign of Queen Elizabeth. Religious persecution was the spirit of that age, and though cruelty does not appear to have been part of Whitgift's character, he was a stern disciplinarian—inflexible in his principles, and resolute in their application. Doubt was unknown to him, and he would not allow it in others. With this strong conviction of right, he regarded all dissentients as obstinate schismatics unwilling to be convinced of their errors, and therefore deserving of punishment. His chief object however was to exclude nonconformists from the Church, rather than to seek out and punish heretics. To this duty he repeatedly affirmed that "her majesty moved and earnestly exhorted him, with strait charge, as he would answer the contrary;" and he would listen to no solicitation to bend him from his purpose. Having heard of threats against his person, he writes to Lord Burghley, "And if there be no other remedy, I am content to be sacrificed to so good a cause; which I will never betray, nor give over; God, her majesty, the laws, my own conscience, and duty, being with me." The Lord Treasurer Burghley, who had always been his firm friend, often expressed his disapprobation of Whitgift's severity, and contended wisely, as well as humanely, that the ministers of the Church ought not to be questioned upon minute points of doctrine, unless they were "notorious offenders in papistry and heresy," and "wished that the spirit of gentleness might win, rather than severity;" yet in spite of the remonstrances of that great man, and even of the council, Whitgift persisted in maintaining an inquisition in the Church which drove many pious men into dissent.

Whether convinced of the evils of such inquisition, or at length overcome by the persuasion of others, we find him, in 1585, assenting to the advice of Secretary Walsingham, and agreeing to require subscription of those only who were hereafter to enter into livings or the ministry, leaving unmolested the clergy already in the enjoyment of benefices, provided they read the Book of Common Prayer according to the appointed ritual.

In order to secure uniformity of opinion, he obtained from the court of Star Chamber, of which he was a member, a decree to restrain the liberty of the press. By this decree, of June 23, 1585, no printing-presses were allowed anywhere but in London, Oxford, and Cambridge; the number of these was to be settled by the archbishop and bishop of London: no book was ordered to be printed without having been perused by them, and all persons selling, uttering, or even binding unauthorised books were liable to three months' imprisonment.

Notwithstanding the strictness of Whitgift's views in matters of ecclesiastical discipline, his natural character was free from harshness or severity. He earnestly besought the queen to pardon Udal, and others condemned to die for their sedition; and for the dismission of Cartwright and other contentious ministers from the Star Chamber. His integrity, his piety, and his learning, gained the esteem of the best men of his time, and the respect of his most decided opponents. His respect for learning and learned men was evinced on various occasions. Hooker dedicated his 'Ecclesiastical Polity' to the archbishop, not only on account of his high office in the Church, but in gratitude for previous favours and encouragement. The antiquary Stowe dedicated to him his 'Annals' in 1600, and said, "that his grace's great love and affection to all good studies in general, and to antiquities in particular, had been so singular, that all who liked and loved good studies justly esteemed him their principal and greatest patron."

The archbishop always took a lively interest in the management of public charities, and contributed munificently to their foundation and support. In 1584 he restored the ancient hospital of Eastbridge, for the relief of the poor, in the city of Canterbury, enlarged its endowments, and improved its original foundation. He also built and endowed, entirely from his own revenues, an hospital, free-school, and chapel at Croydon in Surrey, the completion of which was accomplished during his own life-time. His liberality gave rise to exaggerated accounts of his wealth and the revenues of his see; to correct which the archbishop drew up an exact statement of all his purchases and of the yearly income of the archbishopric. His steward also stated in the House of Commons, about the same time, that the net income of the archbishop did not exceed 2200*l.*

On the death of Queen Elizabeth Whitgift was afraid lest King James should make alterations in the government and Liturgy of the Church; and in order to conciliate him he deputed Dr. Neryl, dean of Canterbury, to wait upon his majesty in Scotland, and to recommend the Church of England to his favour and protection. The king's answer was favourable to the stability of the Church; but the tenor of Whitgift's correspondence from this time shows him to have been in continual apprehension of change. In October 1603, the king issued a proclamation for a conference of the clergy upon the state of the Church. In the January following this conference was held, in which the archbishop took a prominent part in explaining and defending before the king the doctrines and practices of the Church. The result was a commission to the archbishop and to certain bishops and lords of the council for the regulation of matters in the Church. The most important subjects submitted to them were, "that care be taken that one uniform translation of the Bible be printed, and read in the Church, and that without any notes;" and "that consideration be had what chapters both of the Apocrypha and Canonical Scripture, are meetest to be read in churches." Whitgift however did not live to assist in the consultations of this commission. Soon after the conference, he caught cold while sailing to Fulham in his barge, and on the following Sunday, after a long interview with the king, he was seized with a fit, which ended in an attack of palsy and loss of speech. The king visited him at Lambeth, and told him "that he would pray for his life; and that if he could obtain it he should think it one of the

Digitized by Google

greatest temporal blessings that could be given him in his kingdom." He died on the 29th of February 1603-4, in the seventy-third year of his age, and was buried in the parish church of Croydon.

(Strype's *Life and Acts of John Whitgift, D.D.*; *Life of Whitgift*, by Sir George Paule, 8vo, 1699; Fuller's *Church History of Britain*.)

WHITTINGTON, ROBERT, is the author of several grammatical treatises which were long used in the schools, and of which the fullest account is given in Dibdin's edition of Ames's 'Typographical Antiquities.' He calls himself on the title-paces a native of Lichfield (Lichfeldiensis), and he appears to have been born there about 1460. He was educated by the eminent grammarian John Stanbridge, in the school then attached to Magdalen College, Oxford; and, after having taken priest's orders, he set up a grammar-school of his own about 1501, probably in London. All that is known of the rest of his history is that he was alive in 1530. But, besides his school books, Whittington wrote also Latin verse with very superior elegance; and he is remembered in modern times principally as the last person who was made poet laureate (*poeta laureatus*) at Oxford. This honour he obtained in 1513, on his petition to the congregation of regents of the university, setting forth that he had then spent fourteen years in studying and twelve in teaching the art of grammar (which was understood to include rhetoric and poetry or versification), and praying that he might be laureated, or graduated, in the said art. These academical graduations in grammar, on occasion of which, as Warton states, "a wreath of laurel was presented to the new graduate, who was afterwards usually styled *poeta laureatus*," are supposed to have given rise to the appellation as applied to the king's poet, originally styled the king's versifier (versificator), who seems to have been merely a graduated grammarian or rhetorician employed in the service of the king. Whittington, as had been customary, on obtaining his laureateship, composed a hundred Latin verses, which were published by being stuck up on the great gate of St. Mary's church. After this he used to style himself in the title-pages not only master of grammar (*grammatices magister*), but chief poet of England (*protoreates Anglice*). The title however conferred no academical rank, and it is known that Whittington was afterwards admitted to the degree of Master of Arts. Whittington's Latin verse has been highly praised. Of his 'Epigrammata' (printed by De Worde in 1519, and of the greatest rarity), being long addresses to Charles Brandon, duke of Suffolk, Sir Thomas More, and the poet Skelton (who, like himself, had been made *poeta laureatus* at Oxford in 1489), Warton says, "Some of the lines are in a very classical style, and much in the manner of the earlier Latin Italian poets." ('Hist. of Eng. Poet,' ii. 441, &c.)

WHITWORTH, the name of an ancient Staffordshire family, which has produced two diplomatists of some note.

CHARLES WHITWORTH, eldest son of Richard Whitworth, of Blowerpipe in Staffordshire, was born at Whitmaston about the time of the Revolution, and died in 1725, at London. He was an *attaché* of Mr. Stepney at several courts, and in 1702 was himself appointed resident to the Diet at Ratisbonne. In 1704 he was named envoy to the court of Russia; and in 1710 he was again sent to that court with the title of ambassador extraordinary, to prevent, if he can, Great, irritated by the arrest of his ambassador in the public streets of London at the suit of some tradesman. Whitworth was subsequently—plenipotentiary to the Diet of Augsburg and Ratisbonne in 1714; envoy extraordinary and plenipotentiary to the King of Prussia in 1716; envoy extraordinary to the Hague in 1717; again plenipotentiary at Berlin in 1719; and representative of Great Britain in the character of ambassador extraordinary and plenipotentiary at the congress of Cambray in 1722. He was created Baron Whitworth of Galway in 1721 by George I. Lord Whitworth retired into private life in 1724, and died in the ensuing year, without issue. His 'Account of Russia as it was in the year 1710' came into the hands of Horace Walpole, and was printed by him at the Shrewsbury press. In the preface Walpole mentions that many volumes of Lord Whitworth's state letters and papers were in the possession of his relations.

CHARLES WHITWORTH, grandson of Francis, a younger brother of the preceding, who was M.P. for Minehead in Somersetshire, surveyor-general of the woods and forests, and secretary of the island of Barbadoe, was born at Leybourne in Kent in 1754. His father, Sir Charles (also M.P. for Minehead), sent him to be educated at Tunbridge school, and on his leaving that place procured him a commission in the Guards. How he came to exchange the military for the diplomatic service does not appear, but in 1776 we find him sent to the court of Poland as minister plenipotentiary.

In 1788 Whitworth was sent as envoy extraordinary and minister plenipotentiary to Russia, where he remained till 1806. Whitworth acquired and retained to the last a marked ascendancy over the councils of the czarina Catherine II. After her death (February 1797) his troubles began. Paul I., resolute to undo everything that his mother had done, refused to ratify the treaty she had concluded with England immediately before her death. The patience and address of Whitworth were however at last successful: in 1797 Paul ratified a treaty of commerce with England. In December 1797 Whitworth signed a provisional treaty by which the Czar agreed to take part in the coalition against France; and in June 1799 a definitive treaty to the same effect. At this time the English minister stood so high in the good graces of the wayward emperor that Paul requested George III. to create him a peer (he had received the ribbon of the Bath in 1793). The request was complied with, but by the time the despatch announcing that he had been created an Irish baron arrived, Paul had quarrelled with Whitworth, and ordered him to quit his dominions.

In 1800 Lord Whitworth was sent to Copenhagen to terminate amicably the differences arising out of the capture of the Danish frigate Freya and her convoy by English men-of-war. He concluded a convention with Count Bernstorff on the 29th of August. On the 7th of April 1802 he married the Duchess-Dowager of Dorset, and remained unemployed till the latter end of 1802, when, having been previously sworn a privy councillor, he was appointed ambassador extraordinary and plenipotentiary to the French government. He remained at Paris till the 13th of May 1803. Little was effected or could be effected by this mission: the struggle between Bonaparte and England had already become a struggle of life or death, and both parties felt it. The most striking incident during Lord Whitworth's embassy was the rude reception he experienced from Bonaparte in full court at the Tuileries.

Lord Whitworth did not after his return from Paris hold any diplomatic appointment; although a tour which he made to Paris and Naples in 1819, with the Duchess of Dorset and a numerous and rather ostentatious suite, gave rise to some gossip about secret missions. When the country was threatened with invasion from France he raised and clothed a battalion of infantry composed of 600 men. In March 1813 he was made a lord of the bedchamber; on the 14th of June following he was created a British peer by the title of Viscount Whitworth of Adbaston; and in August he succeeded the Duke of Richmond as viceroy of Ireland. On 4 January 1815, on the enlargement of the order of the Bath, he was made one of the twelve civil knights grand-crosses; and in November he was advanced to the dignity of Baron Adbaston and Earl Whitworth. He resigned the lieutenancy of Ireland in 1817, and was succeeded by Earl Talbot. He died (without issue) on the 13th of May 1825.

WICHMANN, JOHANN ERNEST, physician, was born at Hanover on the 10th of May 1740. After having received his early education at the Lyceum of Bremo, he went in 1759 to Göttingen, and commenced the study of medicine under Haller's friendship. He graduated in 1762, and presented as his thesis a paper on the use of certain poisons in the treatment of the bites of rabid animals. After graduating he visited Paris and London. This journey had a great influence on his future career. To the influence of English practice of his views became remarkable in his writings, which are free from much of the speculation with which German writers abound. He returned to Hanover in 1764, and commenced practice. It was not long before his merits were recognised, and on the death of Welhof he was appointed court physician. Wichmann published several works on various departments of medicine, the most remarkable of which is his 'Ideen zur Diagnostic,' published at Hanover in 1794, in 3 vols. 8vo. This work went through several editions, and is possessed of great practical merit. He wrote several other smaller works on various diseases and their treatment, which were all published at Hanover. He died on the 12th of June 1804.

WICKLIFFE, or WICLIF. [WYCLIFFE.]

WICQUEFORT, ABRAHAM DE, was a native of Holland, and was born, it is commonly stated, at Amsterdam in 1598; but he early left his country and took up his residence in France. In 1626 he was appointed by the elector of Brandenburg his resident at the French court; and he held that post till 1658, when, at the instance of Cardinal Mazarin, he was arrested by a lettre-de-cachet, and thrown into the Bastile, on a charge of sending secret intelligence to the government of the United Provinces, and also of being a spy in the pay of other foreign governments. He remained in confinement for a year, and was then released and ordered to leave France. On this he passed over to England, and thence returned to his native country, where the Pensionary De Witt, with whom he had in fact carried on a clandestine correspondence, procured him the appointment of historiographer to the States, or, according to other accounts, of secretary-interpreter for foreign despatches. Possibly he held both these offices, for they may have formed only one office. At the same time the duke of Brunswick-Lüneburg appointed him his resident at the Hague. It was De Wicquefort's ill fortune however to fall a second time under the suspicion of betraying his trust; in March 1676, he was arrested and placed in confinement at the Hague, on the charge of holding secret correspondence with the enemies of the States, and in November following was condemned to perpetual imprisonment and to the forfeiture of all his effects. He remained in custody till 1679, when he effected his escape by exchanging clothes with one of his daughters, and took refuge at the court of the Duke of Zell. Quarrelling however with that prince because he would not exert himself with more zeal to procure the reversion of the sentence passed upon him by the Dutch government, he left him in 1681, and is supposed to have died the year after.

In that age of profligate policy De Wicquefort was in much request for his dexterity and accomplishments (and the more perhaps from the belief of his unscrupulousness and want of principle); but he seems to have enjoyed no reputation on any other account. He is respectably known however in a literary capacity. His first publication appears to

Digitized by Google

have been a translation into French from the German of the travels into Muscovy, Tartary, and Persia of Adam Olearius, 'Relation du Voyage de Moscovie,' &c., which appeared at Paris, in 4to, in 1656, again at Paris, in 2 vols. 4to, in 1659, and in a third edition, which is by far the best, at Amsterdam, in folio, in 1726. This was followed by a translation into French from the Spanish of the embassy of Garcias de Silva into Persia, 'L'Ambassade de D. Garcias de Silva Figueroa en Perse,' &c., Paris, 4to, 1667. After his imprisonment at the Hague he published at Cologne, in 12mo, a defence of himself under the title of 'Mémoires touchant les Ambassadeurs, &c. par L. M. P.' (meaning, it seems, 'Le Ministre Prisonnier'). But his two principal works are his treatise entitled 'L'Ambassadeur et ses Fonctions,' first published at the Hague in 2 vols. 4to, in 1681, and subsequently at Amsterdam, in 2 vols. in 1730, and in 1736; and his 'Histoire des Provinces Unies,' or 'History of the United Provinces from the peace of Munster,' which he began to write on his return to Holland, in 1659, under the inspection of De Witt. He had both written and printed a considerable portion of this latter work when he was thrown into prison in 1676; but it was first published in a folio volume at the Hague, in 1719. Another posthumous work of De Wicquefort, entitled 'Mémoires sur le Rang et la Prescance entre les Souverains de l'Europe,' was published at Amsterdam, in 4to, in 1746.

* WIDNMANN, MAX, professor of sculpture in the Royal Academy of Art at Munich, was born in 1812, at Eichstadt in Bavaria; received his early education in the gymnasium of that town; and while still a youth, entered as a student in the Royal Academy at Munich. There he studied sculpture under Schwanthaler, whose assistant he became; but he also produced several independent works—among them a statue of 'Ajax,' and a group of 'Samson and Delilah.' In 1836 he went to Rome, where he remained three years, and whilst there produced his Shield of Hercules, from the description of Hesiod—a work which gained him a high reputation. After his return to Munich he executed among other things a group of 'Apollo and Coronis;' several bas-reliefs: a marble statue of the statesman Johann Von Mandel; and one of General Von Heydeck; as well as several busts for the Ruhmershalle at Munich; and he steadily rose to be one of the first artists in the German metropolis of art. In the death of Schwanthaler, in 1848, he was accordingly appointed to succeed him as professor of sculpture in the Academy. He has since produced, among other works, colossal statues of the musical composers, Orlando di Lasso and Gluck, for the Odeon; of Speech in classic costume, for the Glyptothek; and the marble group of 'A Hunter defending his Family from the attack of a Panther' (1851): of this group, and of his Shield of Hercules, there are casts in the Crystal Palace at Sydenham.

WIEBEKING, CARL FRIEDRICH, an eminent practical engineer and writer on hydraulic and civil architecture, was born at Wolgast in Pomerania, in 1762. He had applied himself so early and so earnestly to the practical study of topography, that when only seventeen he was entrusted with the task of making a statistical survey or chart of the duchy of Mecklenburg-Strelitz, which was engraved on nine sheets. His success in this, his first undertaking of the kind, caused him to be employed almost immediately afterwards by the Prussian government to make a similar survey of Pomerania between Belgard and Zamow. From about 1784 to 1788 he was engaged in making similar surveys of their territories for the duties of Gotha and Weimar and the rulers of some other German states; during which period he also devoted a considerable portion of his time each winter to the study of architecture, as well civil and military as hydraulic and engineering. In 1788 he was appointed engineer in the service of the duchy of Berg, and in 1792 he first appeared before the public as a writer on professional and scientific subjects, in a work entitled 'Ueber Topographische Charten,' and his 'Beiträge, &c.,' or 'Contributions to Practical Hydraulic Architecture and Machinery.' From this time he was chiefly occupied for many years in large works, 'Wasserbaukunst,' to collect materials and information for which he visited Holland, and afterwards France, the latter country together with his father-in-law, Oberbaurath Rousseau, the results of which scientific journey are given in the third and fourth volumes of the first edition, which was brought out in five volumes, from 1798 to 1805. This work obtained for him a high reputation not unattended with other advantages, for in 1802 his services were engaged by the Austrian government, with an accession to his income of 2000 florins as a salary, and he was employed to inspect the ports and harbours of Trieste, Venice, Fiume, and other places within the Austrian Italian territory. He was thus occupied till about 1805, when he was invited to Bavaria, and there became chief engineer and inspector of roads and canals, which appointment he continued to hold till 1818, when he retired upon a pension. While actively engaged in his extensive professional duties, he had not neglected his literary occupations, one of which was a new edition of his 'Wasserbaukunst;' and now that he was released from the former, he applied himself diligently to his pen, and undertook another very extensive work of a far more generally interesting and popular character than the former, namely, his 'Theoretisch-practische Bürgerliche Baukunde,' a general course of civil architecture and its history, in 4 vols. 4to, with a very large folio atlas of plates, 1821-8. This work is certainly a very valuable contribution to architectural study, if only on account of the fund of fresh information it supplies relative to the architecture of Germany, Holland, Poland, Russia, and some other parts of Europe, in regard to which scarcely anything can be gathered from any other general collection of the kind. But the Atlas is of an inconveniently large size, and the plates themselves are inferior specimens of architectural drawing, being executed for the greater part in a coarse, loose, and untrustworthy style. Very great allowance however is to be made for the defects and deficiencies of a work so comprehensive in its plan as to exceed the means of a single individual, however well qualified or however industrious.

As to Wiebeking's own talents in architecture, it does not appear that he ever executed or designed any building actually erected, a circumstance not particularly to be regretted if we may judge of what he could have done from the specimens which he has given in the work we have just been speaking of. Besides the works already mentioned, he published several others, his 'Theoretisch-practische Strassenbaukunde,' 1808, and, so late as 1840, one entitled 'Analyse Historique et Raisonnée des Monumens de l'Antiquité; des Edifices les plus remarquables du Moyen Age, &c.' and dedicated to Queen Victoria of England. The Chevalier von Wiebeking, as he was usually called, being knight of several German and foreign orders, as well as member of nearly all the principal academies and learned societies in Europe, died at Munich, May 22th 1842, in his eighty-first year, without having experienced much previous indisposition or the infirmities usually attending such advanced age.

WIELAND, CHRISTOPH MARTIN, was born on the 5th of September 1733, at Oberholzheim, a village in the neighbourhood of Biberach, in Suabia, where his father was pastor. Mr Wieland, who belonged to the Pietistic party of German Protestants, was well acquainted with the ancient languages, and a good philosopher of the school of Christian Wolf. From Oberholzeim he was transferred soon after the birth of his son to Biberach, where he died at an advanced age, as senior of the Protestant ministry of the place. The mother of Wieland was, according to his own description, a model of a pious, domestic, and affectionate woman. The influence of such parents is visible more or less throughout the life of Wieland, and under their direction his talents were awakened at an unusually early age. In his seventh year he read Cornelius Nepos with great facility, and began to learn Greek; in his eleventh year he attempted to write Latin poetry, and in his twelfth he wrote a German epic on the destruction of Jerusalem. The early years of his life were passed happily in his father's house. In the fourteenth year his father sent him to the school of Klosterbergen, near Magdeburg, where he paid great attention to the ancient languages. Xenophon, especially the 'Cyropædia,' with its beautiful episode of Araspes and Panthea, and the 'Memorabilia' of Socrates, which he used to call the Gospel of the Heathens, made the deepest impression upon him. During this period he also read with great zeal the German translations of Steele, Addison, and Shaftesbury, and the original works of Voltaire, D'Argens, La Metrie, and others, for he had learned French in a very short time without a master. His French reading tended to destroy his religious feelings, but with it his peace of mind. One of his fellow-students the change which had taken place, and succeeded in calming the struggle which was going on in his mind; but his health was already much impaired by it. When he had attained his sixteenth year, his father sent him to reside with a relation, a physician at Erfurt, for the recovery of his health, and to prepare himself for the university.

After having spent eighteen months at Erfurt, a residence which, as he himself says, was more useful than agreeable, he returned, in the summer of 1750, to his parents at Biberach, where he passed six months, the happiest of his whole life—for it was the period of his first love for a cousin, Sophia von Gutermann, who afterwards became known as a writer under the name of Sophia de Laroche. The attachment to her and her conversation had an extraordinary influence upon Wieland: he describes it as having made him an enthusiast for religion and everything that was good and virtuous. It was during a conservation with her that he conceived the idea of a didactic poem 'On the Nature of Things, or the most perfect World' ('Ueber die Natur der Dinge, oder die vollkommenste Welt'). This poem, although Wieland afterwards wished to suppress it, as a juvenile production, excited among the leading men in matters of taste a very favourable opinion of the young author's talents. In the autumn of 1750 Wieland went to the university of Tübingen, professedly to study the law, but he occupied himself chiefly with classical literature, philosophy, and modern poetry, and devoted to his professional study only as much attention as was necessary to enable him to pass his examination. Socrates appeared to him the beau idéal of a man, and he resolved to follow his example. De Bar's 'Epitres Diverses,' which soon caused a great sensation in Germany, fascinated Wieland to write his ten moral epistles ('Zehn Moralische Briefe,' Tübingen, 1751), which were addressed to Sophia. These letters, which are distinguished for humour and delicacy of feeling, are the best picture of the state of his mind at that time. Another didactic poem, the 'Anti-Oracle,' the production of a few days, is greatly inferior to his moral letters. While at the university Wieland showed little inclination to form friendships with the young men of his own age: his great desire was to become acquainted with the chief literary men, and to join them in their labours for improving the national taste. With this

view he sent a specimen of an epic poem, 'Arminius,' to Bodmer, at Zurich, which laid the foundation of an intimate friendship between this great critic and Wieland.

In 1752 Wieland returned to Biberach, and as he had no prospects of obtaining an appointment, he formed the plan of going to Göttingen, taking his degree and entering upon the career of an academical teacher there. But this plan was given up, and he accepted the invitation of Bodmer, who asked him to come to Zürich and remain in his house, until a suitable appointment should be found. Wieland, on his arrival at Zürich, was received in the kindest manner by Bodmer, and soon found in him a second father. Bodmer and Breitinger were then at the head of the new school of German poetry, which vigorously and successfully combated the pedantic formalism of Gottsched of Leipzig and his followers. Wieland gained the esteem and admiration of Bodmer, and was not only made acquainted with the best productions of German literature, but also with the most eminent men, who assembled round Bodmer as the greatest critic of the day. In the first year of his stay at Zurich, Wieland, at the request of his patron, prepared a new edition of a collection of polemical essays against Gottsched, on the improvement of taste in Germany ('Sammlung der Züricherischen Streitschriften zur Verbesserung des Deutschen Geschmackes wider die Gottschedsche Schule, von 1741-44'), and accompanied it with a preface. All that Wieland wrote at Zürich bears the strongest marks of Bodmer's influence, both in form and sentiment, and although Bodmer himself was a poet of very inferior merit, Wieland expatiated at great length on the beauties of his poetry, especially the epic 'Noah' ('Von den Schönheiten des Bodmer'schen Gedichts von Noah'). Wieland always considered himself still more as the disciple of Bodmer in his epic 'Der Gepriifte Abraham,' in three cantos, in which Bodmer greatly assisted the young poet; in 'Briefe von Verstorbenen an hinterlassene Freunde' (Zurich, 1753), and various other compositions: for during this period Wieland wrote with the same haste and want of reflection as his patron.

In 1754 Wieland, fortunately for him, left the house of Bodmer, to undertake the education of the sons of two distinguished families at Zurich. The circle in which he now began to move obliged him to make himself acquainted with Italian, French, and English poetry, and his acquirements in the study of Shakespeare, and Euripides, gradually led him to the path which was most suited to his genius. His reason now began to gain the ascendancy over his imagination and feelings. The acquaintance of a distinguished actor induced Wieland about this time to try his strength in the dramatic style, and he wrote the tragedies 'Lady Johanna Grey,' 'Clementina von Porretta,' and the comedy 'Pandora;' but these attempts met with no success, and he found out in time that the drama was not his proper sphere. After having been engaged as a teacher at Zurich for four years he accepted the situation of Rath in a distinguished family at Bern, but he soon gave it up, and occupied himself with lecturing on philosophical subjects, and with new literary undertakings. His residence at Bern, and especially his intercourse with women of acquirements and situation, gave to his mind a more decided turn, and his real talents now began to be developed. Among the women who exercised a great influence over him, we may mention the celebrated Julia Bondii, the friend of Rousseau. It was at Bern that Wieland wrote the beautiful story of 'Araspes and Panthea,' and conceived the plan of his 'Agathon,' his most celebrated novel; he also wrote here the first five cantos of an epic called 'Cyrus,' which appeared in 1757, and of which a new edition was published in 1759; 'Cyrus' however was never completed.

In 1760 Wieland returned to Biberach, where he obtained an appointment in the administration of the town. He now seemed to find recreation in the study of Shakspere, twenty-eight of whose dramas he translated into German (Zürich, 1762-66, 8 vols. 8vo). This was the first German translation of Shakspere; but Wieland, whose mind had been nurtured chiefly by the study of Plato, Xenophon, Euripides, and the French writers, was not the man to give a faithful picture of the great dramatist; his translation has a certain prettiness, elegance, and polish, but he never comes up to the strength and pathos of Shakspere. Germany however must be grateful to him for having taken the first step towards nationalising Shakspere, and for having paved the way for his successors, Eschenburg, Voss, Schlegel, and others. Another circumstance which relieved the dullness of his life at Biberach, and gave to his mind a peculiar turn, was that Sophie de Laroche, accompanied by her husband and Count Stadion, came to stay in the neighbourhood of Biberach, whither the count retired from public service. Wieland formed the acquaintance of the party, and became the sincere friend of all. The extensive library of the count, and his knowledge of the world, suggested new thoughts and ideas to Wieland. Wieland, who was at all times very susceptible to influences from without, became in the company of his new friends a man of the world. His religious enthusiasm left him, and a sort of practical wisdom became his guide, which to some extent destroyed the intensity of his feeling, but at the same time laid the foundation of his literary greatness. Wieland's compositions of this period combine the refined sensuality of the Athenians with a sort of practical philosophy and the elegance of the French. That a voluptuous sensuality runs through all his productions of this period cannot be denied; but this sensuality, however seductive it may be to a youthful and inexperienced reader, was in reality only the playful musings of his imagination, and perhaps the consequence of his overanxiety to obtain a numerous class of readers: his personal character at this, as well as all other periods of his life, was of the highest moral purity. His first production of this kind was his poetical story of 'Undine' (1762), which was followed by 'Komische Erzählungen' (1763-64), 'Abenteuer des Don Silvio von Rosalva, oder der Sieg der Natur über die Schwärmerei' (1764) which is a sort of imitation of Cervantes' 'Don Quixote.' During this period, which may be termed the frivolous period of his life, the things for which he had before entertained the highest enthusiasm, such as love, religion, virtue, and philosophy, were occasionally ridiculed as unnatural, and as the mere offspring of our fancy. But during this same period he produced his best novel, 'Agathon' (1766), the scene of which is ancient Greece, and in which he endeavours to show how far a man may advance in wisdom and virtue by the mere use of his natural faculties, and what influence outward circumstances may have upon him. The works which he wrote about or shortly after this time are all of an erotic character, such as his 'Idris und Zenide' (1767), a romantic poem in five cantos; 'Musarion,' a work unique in its kind for the ease, gracefulness, and harmonious beauty of its style, which the author himself called a philosophy of the Graces; and a poem entitled 'Die Grazien' ('The Graces') 1770. In his novel, 'Der neue Amadis' (1771) Wieland endeavoured to show the superiority of intellectual over mere physical beauty; a theme which he took up again in his later years in his 'Krates und Hipparchia.'

In 1765 Wieland married the daughter of an Augsburg merchant, a lady to whom he sincerely attached himself, and with whom he lived happily for thirty-five years. She bore him fourteen children in twenty years. In 1769 he was invited to the professorship of philosophy in the University of Erfurt. He accepted the offer, and discharged the duties of his office with the most honest zeal, but the envy and the intrigues of the academic body, who thought it a disgrace that a poet, and an erotic poet too, should be among them, placed the most vexatious obstacles in his way. The secret and open attacks that were made upon him, drew forth the humorous poem 'Der Verklagte Amor,' and 'Nachlass des Diogenes von Sinope' (1770). The former of these works is the last of his erotic productions written to defend that kind of poetry. The latter was composed to defend his own views of human life and of philosophy. The works which now followed had a more serious and philosophical character, partly in consequence of his position at Erfurt, and partly through the events of the times, among which we must mention the effects produced by the works of Rousseau, and the reforms introduced by the Emperor Joseph II. Wieland attacked the doctrines of Rousseau in a small humorous novel entitled 'Koxkox und Kikequetzel' (1769 and 1770), and in his 'Beiträge zur geheimen Geschichte des menschlichen Verstandes und Herzens, aus den Archiven der Natur' (1770). Another work, which appeared two years later under the title 'Goldener Spiegel oder die Könige von Scheschian,' is a collection of the most important lessons which the rulers of mankind should derive from history.

Wieland was not at Erfurt long without attracting the attention of the Duchess Amalie of Saxe-Weimar. She wanted a person to complete the education of her two sons, and she chose Wieland on the recommendation of Dalberg. In 1772 Wieland accordingly went to Weimar, where he received the title of Hofrath, and a salary of 1000 thalers, which was continued after the cessation of his duties under the name of a pension. The kind and honourable manner in which he was received at the court, the attachment of his pupils, and the intercourse of the distinguished men who were already assembled round the ducal duchess, had such charms for Wieland, that he felt at once that he was in his proper sphere. His first literary productions at Weimar were a melodrame, 'Die Wahl des Hercules,' and a lyric drama 'Alceste' (1772), which were received with extraordinary favour, and are still among the better productions of the kind in Germany. It was an important event in the literary history of Germany that Wieland established and edited the 'Deutscher Mercur,' a monthly periodical devoted to criticism and matters of taste. Wieland alone edited it from 1775 to 1789, and from 1789 to 1805 in conjunction with the well-known archæologist Böttiger. Wieland's own criticisms were on the whole neither true nor profound, and when he expounded his principles in his letters on his 'Alceste,' Göthe and Herder rose in arms against him. Göthe wrote his well known farce 'Götter, Helden, und Wieland,' to which Wieland replied in a humorous way and with his usual nalivete. The affair drew the attention of Wieland's pupils to Göthe, who was subsequently also invited to Weimar, and became the friend of Wieland. The first important work which appeared after Wieland's arrival at Weimar, was his humorous history of the Republic of the ancient town of Abdera ('Die Abderiten,' 1773), which the author intended to be an analysis of the errors, contradictions, and singularities in human nature. It was followed by 'Erzählungen und Mährchen' (1775-83), which are distinguished from his earlier works of fiction by greater earnestness, depth of feeling, and the absence of voluptuous descriptions. The greatest of all Wieland's poetical productions is his epic romance 'Oberon,' in 12 cantos, which appeared in 1780.

After the publication of 'Oberon,' Wieland abandoned the field of romantic poetry, to devote the remainder of his life to the study of

Digitized by Google

the Greeks and Romans, and he formed the design of making all Germany acquainted with the masterpieces of the ancients by a series of translations. He began with a translation of Horace's 'Epistles' (1782, reprinted at Leipzig in 1816, 2 vols. 8vo, and at Leipzig, 1837, 4th edition), which was followed by Horace's 'Satires' (1786, reprinted 1819, 2 vols. 8vo.). Both works are accompanied with commentaries and introductions, which are useful, especially for the history of the period of Horace. The translation itself is free, as it was intended more for the general reader than for scholars, and is more like a modernisation than a real translation. The next production was a translation of Lucian (Leipzig, 1788-91, 6 vols. 8vo.), likewise with a commentary. Tooke's translation of Lucian is made from the German of Wieland. Wieland himself declares his translation of Horace's 'Epistles' an 'his commentaries upon them to be his best work, and that from which his own individuality could be best recognised. The fruits of Wieland's long study of Lucian are also visible in the following works, which are very successful imitations of that writer:—'Dialogen in Elysium' (1791), 'Göttergespräche' 'Gespräche unter vier Augen,' and 'Peregrinus Proteus' (1791). Simultaneously with these labours Wieland wrote a great number of essays for the 'Deutscher Mercur,' which, when collected, filled sixteen volumes of his works. A collection of all Wieland's works was published at Leipzig from 1794 to 1802, in 36 volumes, and six supplementary volumes, in 4to, and great and small octave. In this collection all the works underwent a careful revision, and some were almost entirely rewritten. The handsome remuneration which he received for his edition enabled him to realise one of his favourite schemes: he purchased the small country-house of Osmannstedt, near Weimar, in the picturesque valley of the Ilm, where he resided and expended the remainder of his life. He took up his residence there in 1798, with his wife and children, and it was here, in the enjoyment of a quiet and patriarchal life, that Wieland unfolded all the excellence of his character. He continued down to his death to devote the greater part of his time to literary labours. From 1796 till 1804 he alone edited the 'Attisches Museum,' and from 1805 to 1809, conjointly with J. Hottinger and Fr. Jacobs, under the title of 'Neues Attisches Museum.' This journal was chiefly devoted to the illustration of Greek literature, and here he resumed his old and favourite plan of giving to his countrymen a series of translations of the best Greek writers, of which a great many are contained in this journal. Some original works which appeared about this time contained the fruits of his renewed study of antiquity, such as 'Aristippus und einige seiner Zeitgenossen' (1800-1802), and the small novels 'Krates und Hipparchia' and 'Meoander und Glycerion.'

Fortune, which had hitherto always been smiling upon Wieland, had reserved some of its hardest blows for his old age. After the death of Sophie Brentano, a grand-daughter of Sophie La Roche, who had been living in his house and had been attached to him as to a father, he lost, in 1801, his wife. After this event the retreat of Osmannstedt had no more charm for him: owing also to some misfortune, he would have been obliged to encumber it with debt, if he had kept it longer; accordingly he disposed of it, and returned in 1803 to Weimar, where he soon formed an intimate friendship with Schiller. In the same year he was elected a foreign member of the National Institute of France; during the congress at Erfurt in 1808, Napoleon honoured him with the order of the Légion d'Honneur, and the Emperor Alexander of Russia with that of St. Anna. But the year before, death had deprived him of his friend and patron the Duchess Amalie, in whose company, during the last part of her life, he had spent some hours almost every day. In 1809 he was seized with a long and dangerous illness, and he had scarcely got over it when he broke one of his ribs by being upset in his carriage. But he got over this injury, and reappeared in the circle of his friends as cheerful as before. In the year 1806 he had commenced his last great literary undertaking, a translation of all the letters of Cicero, which he continued until his death, on the 20th of January 1813, without being able to complete it. It appeared at Zürich, 1808-21, in 7 vols. 8vo; the last two vols. were completed and edited by F. D. Gräter. In accordance with Wieland's own wish his body was conveyed to Osmannstedt, and buried in the same tomb with his wife and Sophie Brentano.

On the general character of Wieland we may add the following remarks. Wieland was not a poet of the first order: his peculiar talent consisted in appropriating to himself and further developing that which he acquired from others, though he always impressed upon it the peculiar stamp of his own mind. He never penetrated deep into the nature of man, but rather remained in the happy medium; but he is unrivalled in the light and insinuating gracefulness of his productions and the elegance of his style. His philosophy breathes the spirit of Socrates, though not without a mixture of the principles of Aristippus. He did not acquire a thorough and lasting influence upon German literature, but his great merit consists in the amount of knowledge, taste, and refinement which he diffused among his contemporaries, and which has been transmitted to their descendants. Moreover it must not be forgotten that it was Wieland who reconciled the higher classes of Germany to the literature of their own country, and who formed a beneficial counterpoise to the transcendental character which Klopstock and his school introduced into German poetry.

* WIESELGREN, PETER, the Swedish apostle of temperance, and also a voluminous and industrious editor and compiler of miscellaneous works, was born on the 1st of October 1800, at the farm of Spånbult, not far from Wexio in the south of Sweden, the son of Jonas Jonsson, a peasant. From childhood he displayed an unusual sense of religion, at the age of eight he had read the Bible through, and at ten, at the instigation of his mother, had written psalms and a sermon. The minister of the parish took notice of his knowledge of the Scriptures, and recommended him, when ten years old, to a clergyman of the name of Malmberg, who taught him Latin on the condition that he should teach Malmberg's son to read. Young as he was, the boy was never afterwards without a pupil. At the age of eleven he was sent to the school of Wexio, where his entrance into a higher walk of life was signalised by his being equipped with a tarnadoc. The rector, or schoolmaster, Lundelius, hearing from the father, Jonas Jonsson, that he thought he was related to a family bearing the name of Wieselgren, conferred on the son, by his own authority, the name by which he has since been known. At the university of Lund, where he afterwards studied, he was shocked at the laxity of religious feeling which he found prevalent, and began to preach on what in England would be called 'evangelical' principles, at the age of seventeen. From an early period his pen has been incessantly active as an author, and his first work of length 'Which religion is that of Sweden,' Hvilken är Sveriges Religion,' published in 1827, is on a theological subject, but those of his works which have chiefly attracted attention are of a miscellaneous character. One of the most important is the 'Delagardiska Archivet,' Archives of the De la Gardie family, or Papers from Count De la Gardie's library at Löberod,' twenty volumes octavo, with supplements (Lund, 1831-14). The De la Gardie family, descended from a Frenchman, is one of the most illustrious in Sweden, and the library at Löberod, their country-seat, was rich in important documents relating to Swedish history for the last three centuries. Wieselgren, who was employed by the Count to arrange and catalogue the papers, was allowed to publish a selection, which extended to an unexpected length, but which comprises much valuable matter, and might occasionally be consulted with advantage by English historians. In 1843 the Count, at Wieselgren's suggestion, presented the original collection to the library of the university of Lund. Another of his works, a history of the printed literature of Sweden, 'Sveriges Skönа Litteratur,' which was left imperfect, in three volumes (Lund, 1833-35), was founded on the academic lectures which he delivered at the university of Lund, in the capacity of assistant professor of æsthetics, to which he was appointed in 1832, and in which he still remains. In 1837 he was appointed in his native province, by the Chancellor von Engeström. In 1833 he quitted the university to officiate as a parish priest, and was led to occupy part of his leisure on a topographical work in three volumes of a description of the Swedish province of Wexio 'Ny Samling Beskrifning innkrank til Wexiö Stift,' in which he was considered somewhat too fanciful a his introductory speculations on remote antiquity.

As a contributor to Palmblad's Biographical Lexicon of celebrated Swedes [PALMBLAD] he wrote more than two hundred lives, and on the death of Palmblad, in 1852, took the place as editor of the work, which has now attained its twenty-second volume, and appears to be close to its completion. It is from his autobiography contributed as an article to this Dictionary that most of the foregoing particulars have been taken. It concludes with a list of his writings occupying three closely printed pages; but almost the only important work that remains to be added, is his 'Historical Dissertation on Swedish Brandy-Legislation for the last two hundred years' (Lund, 1840), with which he commenced his campaign against Swedish intemperance, which he has now carried on for many years by preaching-tours made during every summer. Wieselgren is also an active advocate of what is called in Germany and Sweden the 'Inner Mission,' a system of visiting the poor for religious purposes, analogous to the 'Home-Missions' of England. He is generally respected as sincere and well-meaning, and on one occasion was proposed by his colleagues to the government as a candidate for the bishopric of Wexio, but his judgment is sometimes less remarkable than his ardour, and as a compiler he is too apt to obtrude his own peculiarities on the reader.

WIFFEN, JEREMIAH HOLME, was born in the neighbourhood of Woburn, in 1792, of Quaker parents, and was educated for the profession of a schoolmaster, a vocation which he followed for several years. He very early however displayed a taste for poetry and literary composition. In 1812 he published a 'Geographical Primer,' for the use of the junior classes of a school, and he contributed some poetical effusions of considerable merit to a volume entitled 'Poems by Three Friends.' He next wrote some spirited stanzas on the portraits in Woburn Abbey, inserted in the Rev. Mr. Parry's 'History of Woburn,' and afterwards reprinted separately as 'The Russells.' In 1819 he published 'Ascian Hours,' and other poems, which attracted the notice of the Duke of Bedford, who appointed him his librarian at Woburn, and his private secretary. From this time he lived in the enjoyment of literary ease, but continued to employ himself actively. In 1820 he published 'Julia Alpinula, the Captive of Stamboul, and other Poems;' in 1822, a translation of the poems of Garcilasso de la Vega; and for many years he contributed original poems and translations to 'Time's Telescope,' and various other periodical works. Among the original pieces may be mentioned 'The Luck of Eden Hall,' as a suc-

Digitized by Google

cessful effort in the old ballad style. In 1830 he published a translation of Tasso's 'Jerusalem Delivered,' on which he had been engaged for several years. He adopted the Spenserian stanza, and the versification is free and flowing, but as a whole it is certainly not calculated to supersede the bold and vigorous translation by Fairfax. In 1833 he published in one 8vo volume 'Historical Memoirs of the first race of ancestry whence the House of Russell had its origin; from the subjugation of Norway to the Norman Conquest;' which was followed immediately by two other volumes of 'Historical Memoirs of the House of Russell, from the time of the Norman Conquest.' The first volume is little more than a series of pedigrees as to the early history of the family, tracing its origin from Olaf, the sharp eyed king of Berik: but the other two are interesting from the events in which the family can be traced authentically to have been engaged, and they are told with faithfulness, though with pardonable partiality. He latterly studied Hebrew and Welsh, from the last-named of which he made several successful poetical translations. Mr. Wiffen maintained his connection with the Society of Friends, holding offices of trust in it occasionally, until his death, which took place suddenly on May 2, 1856, at Woburn Abbey.

WILBERFORCE, WILLIAM, was born at Hull on the 24th of August 1759. His father, Robert Wilberforce, was a merchant in that town, descended from the ancient Yorkshire family of Wilberfoss; his mother was the daughter of Thomas Bird, Esq., of Burton in Driffield, Yorkshire. His constitution was so weak from infancy that in after-life he expressed his gratitude "that he was not born in less civilised times, when it would have been thought impossible to rear so delicate a child." He was however an active and spirited boy, of good ability, and showing even at the early age of seven a remarkable talent for elocution. He commenced his education at the grammar-school of Hull, which he attended for two years; but on the death of his father in 1768, he was transferred to the care of his uncle, William Wilberforce, who placed him as a parlour-boarder in a mean school near Wimbledon. While at this school, his aunt, who was an ardent admirer of Whitefield's preaching, first led his youthful mind to contemplate the truths of religion, but at the same time imbued him with her peculiar views. His mother, on hearing that he was in danger of becoming a Methodist, withdrew him from his uncle's care, and placed him at the Pocklington grammar-school in Yorkshire, under the Rev. K. Basket. His removal from Wimbledon exercised an important influence upon his future life. His own reflection, twenty-six years afterwards, was that it had "probably been the means of his being connected with political men, and becoming useful in life; and that if he had stayed with his uncle he should probably have been a bigoted despised Methodist." At Pocklington his serious dispositions were soon dissipated by a life of ease and pleasure. His talents for society, and his rare skill in singing, made him an acceptable guest with all the neighbouring gentry, and much time was thus wasted in gaiety. Yet we are told that "he greatly excelled all the other boys in his compositions, though he seldom began them till the eleventh hour." It is very remarkable, in connection with his subsequent history, that when fourteen years of age he addressed a letter to the Archbishop of York paper "in condemnation of the odious traffic in human flesh."

In October 1776 he entered St. John's College, Cambridge, at the age of seventeen. Here he was at first introduced to dissolute companions, whose habits were not very congenial to his taste, and he soon shook them off and entered into more suitable society. By the death of his grandfather and his uncle he had become possessed of a handsome fortune, which enabled him to indulge in very extensive hospitality, and discouraged him from exerting himself in his college studies. In spite of his many temptations to idleness, he became a good classic, and acquitted himself well in his examinations; but the irregular and desultory habits which he acquired were not corrected by mental discipline, and he often had occasion to regret that the cultivation of his mind had been so much neglected.

Before he had quitted Cambridge, Mr. Wilberforce determined to enter upon public life. A dissolution was shortly expected, and he aspired to represent his native town in parliament. He had scarcely completed his twenty-first year when parliament was dissolved, and after an active canvass he was triumphantly returned by the electors of Hull. He now came to London, and entered at once into the first society. He was elected a member of the most fashionable clubs, and became intimate with the leading wits and politicians of the day. He had been acquainted with Pitt at Cambridge, and they now met daily in society, and were inseparable friends. The gaiety of his London life did not distract his attention from public business. He attended constantly in the House of Commons, and, without taking much share in the debates, he formed his own judgement upon every question. He was generally an opponent of Lord North's administration, and particularly adverse to the American war, but occasionally voted with the government. Meanwhile his intimacy with Pitt increased, and the genius which that great man displayed led Mr. Wilberforce to predict his rise. "He comes out," he wrote to a friend, "as his father did, a ready-made orator, and I doubt not but that I shall one day see him the first man in the country." In July 1782, Pitt took office with the Shelburne ministry, and Mr. Wilberforce was fixed upon to second the address on the meeting of parliament in December. From this time a tempting prospect of ambition opened itself to Wilberforce. His friend Pitt, who almost lived with him at Wimbledon, and travelled with him on the Continent, was daily becoming more powerful, and Wilberforce's political opinions and position in parliament would have justified him in taking office with his friend and sharing in his future honours. At length, in November 1783, Pitt became prime minister, and Wilberforce, being entirely in his confidence, exerted himself strenuously, as an independent member, in support of the new administration. In parliament his speeches attracted much notice, and in the country all eyes were soon turned upon him by an event most important to the state of parties and to his own personal advancement. In March 1784, when the dissolution was approaching, a county meeting was summoned at York to vote an address in condemnation of the late coalition ministry, and of which the chief object was to defeat the predominant influence of the great Whig families at the ensuing election. Wilberforce hastened to attend this meeting: he addressed the freeholders with singular eloquence and effect; the address was carried; and before he had ceased speaking, a shout arose in the castle-yard, "We'll have this man for our county member." He had secretly cherished a hope of this result, yet, considering the overwhelming power of the Whig nobility, and his own youth and want of connection in the county, he had not ventured to confide it even to Pitt. While an enthusiastic canvass and subscription were proceeding on his behalf, he was re-elected for Hull, and so great was his popularity that his opponent abandoned a contest which seemed hopeless, and, without venturing to a poll, permitted him to wrest from their hands a seat for the county. This signal triumph in the largest county in England contributed, in no small measure, to the success of Mr. Pitt's ministry throughout the country; and in the next session Wilberforce had the satisfaction of seeing his friend supported by a vast majority of the House of Commons.

Thus before he had completed his twenty-fifth year he had attained a station of the highest distinction, and a career of ambition and power lay open to him; but he was destined to follow an original course, to reject the opportunities of personal advancement which offered themselves, and to devote all his energies and sacrifice all his interests to the noble cause of religion and philanthropy. The seductions of gaiety and of ambition had never wholly effaced from his mind the religious impressions received in early youth; and in Cambridge with Isaac Milner in 1784-85 revived his latent zeal. Henceforth a spirit of earnest piety and devotion took entire possession of his mind, and directed all his actions for the remainder of his long and honourable life.

He hastened from abroad to support Pitt's measure of parliamentary reform, and early in the session of 1786 he himself proposed an important plan for purifying county elections, by establishing a registry of freeholders, and holding the poll in various places at the same time. This scheme, so obviously useful, was not carried into effect until long after by the Reform Bill in 1832. Early in 1787 his religious zeal was made public by his activity in promoting the establishment of a society for the reformation of manners, and in obtaining a royal proclamation against vice and immorality; but his conduct in the House of Commons had not yet borne evidence of the change in his opinions. He was merely sensible however of the importance of reforming his public station and influence subservient to the advancement of religion, and only waited for a suitable occasion. While under the influence of these feelings, the slave-trade, which had roused his indignation at the early age when presented to him in all its atrocities, and he resolved to devote himself to its abolition. It required no little fortitude to undertake the cause of the negro race. Burke had shrunk from engaging in it from the conviction of its hopelessness; and the harassing failures in store for Mr. Wilberforce would have discouraged any man whose exertions were not sustained by the highest principle.

Relying more upon the humane and religious feelings of the country than upon parliamentary support, he availed himself of the agency of a society of which Granville Sharp was the president, and Thomas Clarkson the agent. Throughout the struggle, which lasted for twenty years, Mr. Wilberforce was indefatigable. Year after year his hopes were deferred. Thwarted at one time by the protracted examination of witnesses, outvoted at others, now in the Commons, now in the Lords, he never flinched from a renewal of the contest. In parliament he supported his cause by many admirable speeches, and by a diligent collection and sifting of evidence. Out of parliament he never lost sight of the same great object. In his conversation and his letters he conciliated the support of all parties. Cabinet ministers, opposition members, the clergy of all shades of opinion, and his own familiar friends, were alike solicited to advance the cause of abolition. No pains were spared to enlighten the public through the press, sometimes by his own pen, and sometimes by the pens of many willing friends. At the same time he was perpetually alive to all political changes at home and abroad, and ready to avail himself upon any occasion for improving the condition of the negro race by negociation with foreign powers or by the influence of the executive government.

Apart from the opposition which he encountered from the West India interest, the fearful excesses of the French revolution and the rebellion of the slaves in St. Domingo led many to associate the abolition of the slave trade with the frantic schemes of the Jacobins. For seven years this cause alone retarded the success of his endeavours. Meanwhile, though well fitted, morally, for the labours he had undertaken, it is marvellous how his weakly constitution enabled him to

Digitized by Google

bear up against the bodily fatigues which he was forced to endure. In the spring of 1788, when his labours were yet to come, his health appeared entirely to fail, from an absolute decay of the digestive organs. The first physicians, after a consultation, declared to his family "that he had not stamina to last a fortnight;" and although he happily recovered from his illness, we find him exclaiming on New Year's Day, 1790, "At thirty and a half I am in constitution sixty." From his infancy he had suffered much from weak eyes, and his exertions were constantly interrupted or rendered painful by this infirmity. Still rising with new hopes and vigour from every disappointment, he confidently relied upon ultimate success. At length the hour of triumph was at hand. In January 1807 he published a book against the slave-trade, at the very moment that question was about to be discussed in the House of Lords. The Abolition Bill passed the Lords, and its passage through the Commons was one continued triumph to the author. Sir Samuel Romilly concluded an affecting speech in favour of the bill "by contrasting the feelings of Napoleon in all his greatness with those of that honoured individual who would this day lay his head upon his pillow and remember that the slave-trade was no more;" when the whole House, as we are told, burst forth in exclamations of applause, and greeted Mr. Wilberforce with three cheers.

During the whole of this period he had been actively interested in all the momentous questions of that time. He had opposed the war with France at the cost of a temporary estrangement from Pitt; he braved the court and the minister in resisting an addition to the income of the Prince of Wales, and clashed with his early friends in supporting the impeachment of Lord Melville; though no one could have felt more keenly than Mr. Wilberforce such sacrifices of friendship to duty. In the midst of his various engagements he had also done public service to religion. In 1797 he published his 'Practical View of the prevailing Religious System of professed Christians in the Higher and Middle Classes of this country, contrasted with real Christianity.' This work met with extraordinary success. In a few days it was out of print, and within half a year five editions (7500 copies) issued from the press. Since that time a large number of editions have been published in England and America. It has also been translated into the French, Italian, Spanish, Dutch, and German languages. Its merits were appreciated by the highest dignitaries of the church, and by the most eminent of his contemporaries. Edmund Burke spent the last two days of his life in reading it and sent a particular message of thanks to Mr. Wilberforce for having written it. He had also during this period exerted himself to establish a national church in India, and led the way to the appointment of Indian bishoprics. The Church Missionary Society and other religious and benevolent associations were likewise indebted to him for his zealous aid.

Mr. Wilberforce had represented Yorkshire during the whole of that portion of his parliamentary career which ended in the abolition of the slave-trade. Five times he was elected without a contest, and his sixth election tested the affection of his constituents even more than their previous unanimity. Immense subscriptions were immediately raised to defend him against his wealthy opponents, and such was the zeal of the freeholders in his favour, that while the joint expenses of Lord Milton and Mr. Lascelles amounted to 200,000*l.*, the whole charge of bringing to the poll his large majority did not exceed 28,000*l.* At length, when a dissolution was expected in 1812, he determined to resign his seat for the county, although no contest was to be apprehended. Among the chief causes which led to this determination were the great pressure upon his time and strength, in attending to the business of so large a constituency, and the desire of watching over the education of his children.

In 1797 he had married Barbara Ann, the eldest daughter of J. Spooner, Esq., by whom he had a family of six children, the eldest at this time fourteen years old. Though unable to discharge to his own satisfaction the duties of a member for Yorkshire, he was unwilling to retire from parliament, and accepted a seat for the borough of Bramber. His activity in his new position appears to have been as unremitting as before. His chief care was to induce foreign powers to follow the example of England in abolishing the slave-trade. He overlooked no opportunity for furthering this object. The restoration of the Bourbons in France, the visit of the Allied Sovereigns to this country, and the Congress of Vienna especially, were seized upon by him as favourable occasions for enforcing upon European governments the abolition of the slave-trade. In personal interviews and correspondence he laboured to implant his principles in the most influential minds of Europe. The Emperor Alexander, the King of Prussia, Talleyrand, the Duke of Wellington, and Lord Castlereagh, were all in turn solicited, exhorted, or instructed. Even the pope did not escape his vigilance, whose influence he endeavoured to secure in condemnation of the slave-trade.

Up to 1822 his public exertions had been confined to the universal extinction of the slave-trade, but his views of the ultimate abolition of slavery itself had not been withheld, and were now more distinctly declared. His declining health however precluded him from devoting the same labour to this cause that he had given to the former. He entrusted its management in the House of Commons to Mr. Fowell Buxton, and in 1825 retired from parliament, after having spent forty-six years in public life. He spent the remainder of his days in comparative retirement,—an affectionate, cheerful, benevolent, and devout old man,—devoting, as he had done through life, much of his time and from one-third to a fourth of his income in acts of private charity. Family bereavements and loss of fortune were borne with pious resignation, and his last days were cheered by the abolition of slavery. He died in Cadogan-place, when nearly seventy-four years old, on Monday, July 29th 1833; and at the very last sitting of the House of Commons on the preceding Friday, the bill for the abolition of slavery was read a second time. "Thank God," he exclaimed, "that I should have lived to witness a day in which England is willing to give twenty millions sterling for the abolition of slavery." He was buried in Westminster Abbey, with all the honours of a public funeral, and a statue by Joseph is there erected to his memory.

* WILBERFORCE, RIGHT REV. SAMUEL, Bishop of Oxford, was born Sept. 7, 1805, at Broomfield, Clapham Common. He is the third son of the late William Wilberforce, M.P. He was educated at Oriel College, Oxford; in 1826 he graduated first class in mathematics and second class in classics; and M.A. in 1829. He was ordained in 1828, and was appointed rector of Brightstone in the Isle of Wight in 1830. In 1837 he was select preacher before the University of Oxford. In 1839 he received the appointments of rector of Alverstoke, archdeacon of Surrey, and chaplain to Prince Albert, and in 1840 was made a canon of Winchester Cathedral. In 1841 he was Bampton lecturer. In 1844 he received the appointment of subalmoner to the Queen, and in 1845 that of dean of Westminster. In 1845 he was again select preacher before the University of Oxford, took the degrees of B.D. and D.D., and in November 1845 was appointed bishop of Oxford, to which is attached the office of chancellor of the Order of the Garter. In November 1847 he was appointed lord high almoner to the Queen.

Bishop Wilberforce, besides several single sermons, charges to his clergy, and addresses delivered at public meetings, has published 'The Life of William Wilberforce, by his Sons, R. I. Wilberforce, M.A., and S. Wilberforce, M.A.,' 5 vols. 8vo, 1838. He has since published, 'Eucharistica,' 32mo, 1839, consisting of prayers and reflections on the sacrament of the Lord's Supper, collected from old English divines; 'Sermons at Oxford,' 12mo, 1839; 'Rocky Island, and other Parables,' 18mo, 1840; 'Agathos, and other Sunday Stories,' 18mo, 1840; 'The Correspondence of William Wilberforce, edited by his Sons, Robert Isaac Wilberforce, M.A., and Samuel Wilberforce, M.A.,' 2 vols. 8vo, 1840; 'The History of the Episcopal Church in America,' 8vo, 1844; 'Sermons,' dedicated to the Queen, as having been "preached before her, and now published by her command," 12mo, 1844; and 'Sermons preached on several Occasions,' 8vo, 1854.

WILBRORD, or WILLIBROD, SAINT, commonly characterised as 'The Apostle of the Frisians,' was a native of the Saxon kingdom of Northumbria, where he was born about the year 657. His father's name was Wilgils. He was placed, while still a child, under the charge of the inmates of Wilfrid's monastery at Ripon, and remained there till the time when he received the tonsure, which he appears to have done before he reached his twentieth year. At that age he visited Ireland, and attached himself to the ministrations of Egbert and Wigbert, two members of the Anglo-Irish Church. The latter of these had been in Friesland, and had there preached Christianity two years in vain. Wilbrord remained for thirteen years in Ireland, and then resolved to attempt the conversion which had baffled his preceptor. He departed in the year 690, taking with him attendants or disciples to the number of twelve, as Bede and Alcuin say, though Mr. Wright states their number at eleven. They entered the Rhine and proceeded to Trajectum Vetus, Utrecht. Pepin had then just gained a victory over the Frisians, and the conqueror gave the apostle a warm welcome. The latter resolved to add to the influence of the monarch that of the pope, and with this view he visited Rome in 692. Three years afterwards he made a second visit to the head of the Church, and, receiving the pall from the hand of Pope Sergius I, he returned with the title of bishop over the converts attached to his church at St. Cecilia, and with the ecclesiastical name of Clemens. He established his episcopal chair at Utrecht, where he built a church dedicated to St. Saviour, and restored one dedicated to St. Martin. A few years after these events Wilbrord made a proselyting tour through the territories in the vicinity of his diocese. He reached the country of the Danes, where, though fingered their ruler resisted all his attempts, he made several captures. Proceeding by sea, he reached an island called Fositisland, supposed to be the same which is now called Heligoland. Its ancient name was given to it from that of an idol to whose worship it was sacred. The animals that lived upon the island were considered as consecrated, and were not to be used as human food, while the water of the fountains had a like hallowed character. Wilbrord appeased the hunger of his followers with the flesh of the sacred animals, and baptising converts in the holy fountains, roused the wrath of the heathen Frisians and their chief, who subjected him to an ordeal, or lottery, which constituted a form of trial for the indiction of those who should be justly punished. The result of the ordeal was, it seems, miraculously in favour of the apostle; but though it occasioned his honourable acquittal, it does not appear to have increased the number of his converts.

Digitized by Google

In 714 the death of Pepin restored within Wilbrord's own diocese the authority of the same Pagan monarch, Radbod, who had subjected him to the above ordeal, and the people appear to have rapidly lapsed into heathenism. The successes of Charles Martel re-established the bishop in his influence, but the lapse of only two years seems to have given him a great portion of his proselyting labours to do over again. With the assistance of the missionary Wulframn, he brought the stubborn and again defeated monarch Radbod so close to the point of conversion that he had come to the holy font and put one foot in the water, when he started the question whether there were a greater number of Frieslanders in heaven or in hell. On being incautiously told that all the unbaptised kings and nobles who had preceded him were in the latter place, he withdrew his foot, saying he would prefer going to the place where he would meet his ancestors to that which might only happen to be peopled by some of his descendants. Continuing his missionary exertions under the patronage of Charles Martel, Wilbrord made a narrow escape, attributed to miracle, from death at the hands of the priest of an idol which he had destroyed, on the island of Walcheren. He founded the monastery of Epternach near Treves (at what time seems not clearly ascertainable). He there died and was buried, in 738, in his eighty-first year. His day in the calendar is the 7th of November.

WILBYE, JOHN. Of this admirable composer—one of the brightest ornaments of the English school of music—all that is known, his works excepted, is, that in 1598 he was a teacher of music, and dwelt in Austin Friars. (Hawkins, iv. 387.) In 1609 he published a set of 'Madrigals, to three, four, five, and six Voices,' and a second book of the same in 1609. These incindo some of the most lovely, and at the same time the most scientific compositions that, in this department, the art can boast. Another proof of their merit is, 'Flora gave me fairest flowers,' 'Ladye, when I behold the roses sprouting,' 'Sweet honey-sucking bee,' 'Down in a valley,' and 'Stay, Corydon, thou swain;' but only the second of these is mentioned by Sir John Hawkins, though an active member of the Madrigal Society; and but two—the first and second of the above named—by the other musical historian, Dr. Burney. Mr. Warren (afterwards Warren Horne), the original secretary to the Catch Club, published, about seventy years ago, fourteen madrigals for three voices, selected from Wilbye's two sets: these include, 'As fair as morn,' and 'Fly, love, to heaven,' with others of great merit. The Society of Musical Antiquarians have reprinted some of his madrigals in a very handsome manner.

WILD, HENRY, known as the learned tailor, or the Arabian tailor, was a native of the city of Norwich, where he was born about the year 1684, and where he received the most elementary education in Greek and Latin at the grammar-school; on being taken from which however he was bound apprentice to a tailor, with whom he is said to have served seven years in that capacity, and then to have worked seven more as a journeyman. Long before the end of the fourteen years his Greek and Latin had probably been nearly all forgotten. Seven ten, but he was now seized with an illness, which at last obliged him to give up working, and in this state he took to reading as an occupation for his idle hours. The books which fell into his hands, or which he was either by accident or taste led to read, were some old works of controversial divinity; and the quotations from the Scriptures in the original Hebrew, with which they happened to be interspersed, are said to have first excited him to an attempt to make himself master of that language. In prosecuting this object he by degrees recovered his Latin, thus enabling himself after some time to exchange his old English Hebrew lexicon and grammar for better works of that kind written in Latin; and, what was of still more importance, in the course of his studies he also recovered his health, and was enabled to resume his trade. But he did not upon this lay aside his books: he worked part of the day, and devoted the rest, and often also a portion of the night, to study, so that he gradually made himself acquainted with others of the Oriental languages as well as the Hebrew. In March, 1714, he is mentioned as having within the preceding seven years mastered Latin, Greek, Hebrew, Chaldaic, Syriac, Arabic, and Persian. This statement, which is given in a letter from Dr. Turner of Norwich to Dr. Charlett, written at the time, and published in the 'Letters by Eminent Persons' (edited by Dr. Biliss), 3 vols. 8vo, 1811, is, it may be observed, not very easily reconcileable with the common story of his having worked fourteen years as a tailor before he took to study: it would at least require that we should suppose him to have left the grammar-school and been apprenticed before he was nine years of age, instead of when he was "almost qualified for the university," as the common accounts say. This letter of Dr. Turner's, in which he is spoken of as then about thirty years of age, is the authority for the date assigned to his birth. It is clear that either the time he is made to have been at school, or that assigned to the part of his life which was subsequently spent without study, must be shortened. It appears to have been shortly before the date of Dr. Turner's letter that Wild was discovered by the learned Dr. Prideaux, then dean of Norwich, who, upon inquiring one day after some Arabic manuscripts, which a bookseller of the place had some time previous offered to him and which he had then declined to purchase, learned to his alarm that they had since been bought by a tailor. Wild was instantly sent for, and the dean was not only soon relieved from his apprehension that the precious parchments had been cut down for measures, but was astonished by the tailor telling him that he had bought them to read, and proving that he could do so on the spot. A subscription was soon after raised to rescue him from the necessity of labouring with his hands, which really does not seem to have been his proper vocation: "He is very poor," writes Dr. Turner in his letter, "and his landlord lately seized a polyglot Bible (which he had made shift to purchase) for rent:"—a proof that he had hardly been able to make bread by his partial application to his trade of a tailor. Eventually he was taken to the Bodleian Library at Oxford, and employed in translating and making extracts of Oriental manuscripts; and he also added something to his means of subsistence by taking pupils in the Oriental tongues. He did not meet with much encouragement however in the latter line. About the year 1720 he left Oxford and came to London, where he is believed to have spent the rest of his days under the patronage of Dr. Mead. The date of his death is unknown; but he is supposed to have been dead before 1734, in which year was published a translation by him of an Arabic legend entitled 'Mahomet's Journey to Heaven,' his only literary production that ever found its way to the press. This self-taught scholar is said to have been a very inoffensive and amiable man.

WILLIAMS, JOHAN, a celebrated Flemish landscape painter, born at Antwerp. He was the contemporary of Rubens, to many of whose pictures he painted landscape backgrounds, which he knew how to harmonise with the style and colouring of Rubens better than any other landscape painter. Rubens is said to have preferred the works of Wildens to those of Van Uden, whom he employed in the same way. Wildens painted large and small pictures, in some of which there are some good figures painted by himself; but in his best works the figures are painted by other masters. He painted twelve very large pictures, all characteristic pictures of the months, which have been engraved. He died in 1644: the year of his birth is not known; 1584 and 1600 are both given by different writers.

WILFORD, FRANCIS (Lieut.-Col.), known as an Oriental scholar by numerous contributions to the 'Asiatic Researches,' went out to India, in 1781, as lieutenant of those troops which were sent from Hanover, his native country, to reinforce the British troops of the line. Soon after the peace of Mangalore, in 1784, Wilford was stationed at Russapgla, where he devoted some of the time which was not occupied by his professional duties to the elucidation of Hindoo antiquities by means of whatever notices he could find concerning them in Greek and Latin authors: he found however great difficulties from a total ignorance of the Oriental languages; and in his first essay, which was published in the 'Asiatic Researches' (1787), he complains of having no time to study those languages. A few years afterwards he was stationed at Benares, the centre of Hindoo learning, where he engaged a Pandit to instruct him in the sacred dialect, and more especially to point out to him those passages from the Vedas and Puránas which in some measure related to the West. The first fruit of these researches was an essay on 'Egypt and the Nile, from the ancient books of the Hindoos' (1792). It is needless to say that the Pandit had forged authorities to suit the fancies of his unsuspecting employer; yet so skilful were these forgeries, that even the judicious Sir W. Jones was imposed upon by them. Wilford himself describes how the imposture was carried on in the following manner:—"I directed my Pandit to make extracts from all the Puránas and other books relating to my inquiries, and to arrange them under proper heads. I gave him a proper establishment of assistants and writers, and I requested him to procure another Pandit to assist me in my studies; and I obtained, for his further encouragement, a place for him in the college at Benares. At the same time I amused myself with unfolding to him our ancient mythology, history, and geography. This was absolutely necessary, as a clue to guide him through so immense an undertaking, and I had full confidence in him." What is, Wilford wished to know whether there had been any connection between Egypt and India; and the Brahmin immediately substituted the word *Egypt* for the name of any other country mentioned in the Puránas. We have thought it worth while giving the above extract, for it now renders it entirely unnecessary to give a detailed account of his works, which we shall mention, with a warning to our readers not to trust even those which he wrote after discovering the imposture in 1804. This circumstance greatly disturbed his peace of mind, and brought on paroxysms which threatened the most serious consequences to his then infirm state of health. He was an original member of the Asiatic Society, and associé étranger of the Institut de France (Académie des Inscriptions et Belles Lettres), and died at Benares, on the 4th September, 1822. The following is a list of his principal and most great zeal for his subject but an utter want of sound judgment. They are all inserted in the 'Asiatic Researches:'—1, 'Remarks on the Town of Tagara,' i., p. 369 (1787); 2, 'On Egypt and the Nile, &c.,' iii., 295 (1792); 3, 'Dissertation on Semiramis,' iv., 363; 4, 'An Account of some ancient Inscriptions,' v., 155; 5, 'On the Chronology of the Hindus,' v., 247 (1797); 6, 'Remarks on the names of the Cabirian Deities,' v., 297; 7, 'On Mount Caucasus,' vi., 455 (1799); 8, "Essays on the Sacred Isles of the West,' ix., 32; x., 27; xi., 11 (1805-10); 9, 'Chronology of the Kings of Magadha,' ix., 82; 10, 'Æras of
